California High-Speed Rail Authority

San Jose to Merced Project Section

Final Environmental Impact Report/ Environmental Impact Statement

Volume II: Technical Appendices

February 2022

CALIFORNIA High-Speed Rail Authority

The environmental review, consultation, and other actions required by applicable federal environmental laws for this project are being or have been carried out by the State of California pursuant to 23 U.S.C. 327 and a Memorandum of Understanding dated July 23, 2019, and executed by the Federal Railroad Administration and the State of California.

California High-Speed Rail Project

San Jose to Merced Project Section

FINAL
ENVIRONMENTAL IMPACT REPORT/
ENVIRONMENTAL IMPACT STATEMENT

VOLUME 2: TECHNICAL APPENDICES

Prepared under CEQA and NEPA by:

California High-Speed Rail Authority
770 L Street, Suite 620 MS-18
Sacramento, CA 95814
Contact: Serge Stanich

CEQA: This document has been prepared pursuant to the California Environmental Quality Act. The California High-Speed Rail Authority is the state lead agency.

NEPA: The environmental review, consultation, and other actions required by applicable federal environmental laws for this project are being or have been carried out by the State of California pursuant to 23 U.S.C. 327 and a Memorandum of Understanding (MOU) dated July 23, 2019, and executed by the Federal Railroad Administration and the State of California. Pursuant to the MOU, the California High-Speed Rail Authority is the federal lead agency. Prior to the July 23, 2019 MOU, the FRA was the federal lead agency.

TABLE OF CONTENTS

Volume II: Technical Appendices

2-A Roadway Crossings, Modifications, and Closures

2-B Railroad Crossings

2-C Operations and Service Plan Summary

2-D Applicable Design Standards

2-E Project Impact Avoidance and Minimization Features Analysis

2-F PG&E Network Upgrades

2-G Summary of Requirements for Operations and Maintenance Facilities

2-H Emergency and Safety Plans

2-I Alternatives Considered During Alternatives Screening Process

2-J Regional and Local Plans and Policies

2-K Policy Consistency Analyses

2-L Constructability Assessment Report – Record PEPD

- Appendix A: Monterey Highway Viaduct, Typical Section Installation – Full Span Precast
- Appendix B: Monterey Highway Viaduct, Balanced Cantilever Installation
- Appendix C: Monterey Highway Viaduct, Precast Box Girder Yard Dimensions
- Appendix D: San Jose Station Approach Constructability Analysis
- Appendix E: Potential Contract Packages and Schedule
- Appendix F: Potential Construction Sequence at I-280
- Appendix G: Potential Construction Sequence at Monterey Highway
- Appendix H: Track Shift Works

2-M Gilroy LMF Option Consideration and Elimination

3.1-A Parcels within the HSR Project Footprint

3.2-A Transportation Data on Roadways, Freeways, and Intersections

3.2-B Vehicle Miles Traveled Forecasting

3.2-C Traffic Mitigation Measure Screening

3.3-A Air Quality and Greenhouse Gases Technical Report

- Appendix A: CalEEMod Outputs for Station and Maintenance Facility Operation, MOWF Calculations, East Gilroy Transit Calculations
- Appendix B: CALINE4 Outputs for CO Hot-Spot Analysis
- Appendix C: Construction Emission and Cumulative HRA Assumptions

- Appendix D: Ballast Hauling Memorandum
- Appendix E: Localized Impacts from Construction
- Appendix F: Potential Impact from Induced Winds
- Appendix G: Council on Environmental Quality Provisions Covering Incomplete or Unavailable Information

3.3-B Draft Federal General Conformity Determination

3.3-C Changes to Project Benefits Based on 2018 Business Plan

3.4-A Noise and Vibration Technical Report

- Appendix A: Measurement Site Photographs
- Appendix B: Noise Measurement Data
- Appendix C: Vibration Propagation Measurement Data

3.4-B Noise and Vibration Mitigation Guidelines

3.4-C Noise Impact Locations

3.5-A Preconstruction Electromagnetic Measurement Survey along the San Jose to Merced Project Section

3.6-A Public Utilities and Energy Facilities

3.6-B Existing Plus Project Conditions Energy Analysis

3.6-C Water Use Assessment

3.6-D Energy Analysis Memorandum

3.7-A Special-Status Species Subject to Project Impacts

3.7-B Scientific Nomenclature

3.7-C HSR Guideway Enclosure for the Grasslands Ecological Area

3.7-D Supplemental Species Habitat Model Descriptions

3.7-E Supplemental Noise Analysis on Terrestrial Wildlife Species

3.7-F Supplemental Artificial Light Analysis on Terrestrial Wildlife Species

3.8-A Waterbodies Crossed by the Project Alternatives

3.8-B Summary of Hydraulic Modeling for Existing and Proposed Conditions

3.8-C Basin Plan Water Quality Impact Assessment

3.11-A Safety and Security Data

3.11-B Airport Obstructions

3.12-A Relocation Assistance Documents

3.13-A General Plan Land Use Maps—San Jose to Central Valley Wye Project Extent RSA

3.14-A Parcels Containing Important Farmland in the San Jose to Central Valley Wye Project Resource Study Area

3.14-B Results and Findings of Land Evaluation and Site Assessment Pursuant to the Farmland Preservation Policy Act

- Attachment 1: Natural Resources Conservation Service Land Evaluation Explanations and Calculations for Santa Clara County
- Attachment 2: Natural Resources Conservation Service Land Evaluation Explanations and Calculations for San Benito County
- Attachment 3: Natural Resources Conservation Service Land Evaluation Explanations and Calculations for Merced County

3.14-C Remnant Parcel Analysis

3.14-D Induced Wind Impacts: Effects on Pollination; Blossoms and Dust

3.14-E Williamson Act Compliance Data

3.17-A Correspondence

3.17-B Cultural Resources-San Jose to Merced Project Section Tribal Outreach and Consultation Efforts 2009-2021

3.17-C Archaeological and Built Resources

3.17-D Programmatic Agreement among the FRA, the ACHP, the SHPO, and the Authority regarding Compliance with Section 106 of the NHPA, as It Pertains to the California High-Speed Rail Project

3.18-A RIMS II Modeling Details

- Attachment 1: RIMS II Modeling Details

3.19-A Cumulative Nontransportation Plans and Projects Lists

3.19-B Cumulative Transportation Projects List

4-A Concurrence Letter

5-A Environmental Justice Outreach Plan

5-B Environmental Justice Engagement Summary Report

- Attachment A: Environmental Justice Outreach Plan
- Attachment B: List of Outreach Meetings Held for the Project
- Attachment C: Biannual Environmental Justice Outreach Reports
- Attachment D: Environmental Justice Outreach, September 2021

5-C Environmental Justice Development of Community Improvements

- Attachment A: Profiles of Potential Community Improvements

5-D Preferred Alternative, Maps of Disproportionately High and Adverse Effects Before Consideration of Community Improvements

6-A San Jose to Merced Project Section: PEPD Record Set Capital Cost Estimate Report

6-B High-Speed Rail Operating and Maintenance Cost for Use in EIR/EIS Project-Level Analysis

9-A Public and Agency Meeting List

APPENDIX 2-A: ROADWAY CROSSINGS, MODIFICATIONS, AND CLOSURES

APPENDIX 2-A ROADWAY CROSSINGS, MODIFICATIONS, AND CLOSURES

Table 1 Proposed Roadway Crossings of High-Speed Rail, Modifications, and Closures

Type	Alternative	Design Option	Roadway/Path	Existing Road/Path Grade at Roadway Xing	Proposed Road/Path Profile at HSR	Prop. HSR Grade (Above or Below) at Roadway Xing	Grade Separation	Closure	Modification	City	County
Existing	1	Viaduct to I-880	Scott Blvd	Aerial	No change	Below	N/A	N/A	N/A	Santa Clara	Santa Clara
Existing	1	Viaduct to I-880	Lafayette Street	Trench/cut	No change	Above	N/A	N/A	N/A	Santa Clara	Santa Clara

Table 2 Local Roadway Modifications Required for HSR

Roadway	Classification	Description of Change	Alternative			
			1	2	3	4
San Jose to Diridon Station Approach						
Grant St	Other roadway modification	Road shortened		X	X	
De la Cruz Blvd	Grade separation	Changes from overcrossing to undercrossing		X	X	
West Hedding St	Other roadway change	Rebuilds existing overcrossing	X			
West Hedding St	Grade separation	Changes from overcrossing to undercrossing		X	X	
University Ave	Road closure	Converted to a cul-de-sac	X	X	X	
Emory St	Road closure	Converted to a cul-de-sac	X	X	X	
Stockton Ave	Road closure	Converted to a cul-de-sac	X	X	X	
Chestnut St	Alignment change/road closure	Realigned/closed from Ashbury St to W Taylor St	X			
Chestnut St	Alignment change	Realigned		X	X	
W Taylor St	Grade separation	New HSR undercrossing (Caltrain railroad bridge over Taylor is maintained)	X			
W Taylor St	Grade separation	New HSR overcrossing alongside existing Caltrain overcrossing				X
W Taylor St	Alignment change	Realign westbound Taylor St to northbound Chestnut St		X	X	
North Montgomery St	Other roadway change	Extended to maintain property access	X	X	X	
Stover St	Other roadway change	Extend Stover St from S Montgomery St to Autumn St	X	X	X	
Crandall St	Other roadway change	Extend from S Montgomery St to Autumn St	X	X	X	
Cahill St	Other roadway change	Extension to Park Ave and lane conversion to transit only lanes	X	X	X	
SR-87 On-Ramp	Alignment change	Ramp realignment	X	X	X	
Auzerais Ave	4-quadrant gate	2 vehicular arm gates, channelizers, 4 pedestrian arm gates and exit swing gates				X
W Virginia St	4-quadrant gate	2 vehicular arm gates, channelizers, 4 pedestrian arm gates and exit swing gates				X
Fuller Ave	Alignment change	Realignment of Fuller Ave dead end				X
Monterey Corridor						
Almaden Expwy	Alignment change	Realign on-ramp to SR 87	X		X	

Roadway	Classification	Description of Change	Alternative			
			1	2	3	4
Monterey Rd from Southside Dr to between Blossom Hill Rd and Ford Rd	Lane narrowing	Narrowed to four lanes	X		X	
Monterey Rd between Fehren Dr and Blossom Hill Rd	Lane narrowing	Narrowed from six to four lanes		X		
Southbound Monterey Rd	Other roadway change/Alignment change	Road widening for bus turnout, road realignment	X		X	
Monterey Rd between Senter Rd and Skway Dr	Other roadway change	Closure of midblock southbound left turn into shopping center between Senter Rd and Skyway Dr	X	X	X	
Skyway Dr	Grade separation	Skyway Dr depressed and realigned with ramp return to Monterey Rd at grade (Variant A); Monterey Rd depressed (Variant B)		X		
Skyway Dr	4-quadrant gate	4 vehicular arm gates, 50-ft raised median, 4 pedestrian arm gates and exit swing gates, 2 pedestrian barriers				X
Branham Ln	Grade separation	Intersection reconfigured, Monterey Rd depressed, some turn lanes removed		X		
Branham Ln	4-quadrant gate	4 vehicular arm gates, 50-ft raised median, 4 pedestrian arm gates and exit swing gates, 2 pedestrian barriers				X
Rice Way	Road Closure	Access from Rice Wy to Monterey Rd closed		X		
Waterfall Ct	Other roadway change	Extend Waterfall Ct to Broken Lance Ct		X		
Waterfall Ct	Road closure	Close access from Waterfall Ct to Cynoweth		X		
Chynoweth Ave	Grade separation	Roadway reconfigured, some turn lanes removed		X		
Chynoweth Ave	4-quadrant gate	3 vehicular arm gates, 50-ft raised median, 4 pedestrian arm gates and exit swing gates, 1 pedestrian barrier				X
Monterey Rd	Other roadway change	Closure of midblock southbound left turn into shopping center between Chynoweth Ave and Blossom Hill Rd	X	X	X	
Blossom Hill Rd SB Ramp from Monterey Rd to Blossom Hill	Other roadway change	Ramps reconfigured: SB on-ramp moved to other side of Monterey, accessed via SBL pocket		X		
Flintwell Way	Road widening	Widen Monterey Rd at Flintwell Wy	X		X	
Monterey Rd	Other roadway change	Closure of midblock southbound left turn into shopping center at Hicks Ln	X		X	

Roadway	Classification	Description of Change	Alternative			
			1	2	3	4
Bernal Rd	Road Widening	Widening of on-/off-ramps to Monterey Rd	X		X	
Great Oaks Pkwy	Alignment change	Realignment of Great Oaks Pkwy				X
Morgan Hill and Gilroy						
Monterey Rd	Other roadway change	Removal of southbound midblock left turn into Roding Wy	X		X	
Monterey Rd	Road widening	Widening from Metcalf Rd to Coyote Ranch Rd	X		X	
Blanchard Rd	Road closure	Road closure		X		
Blanchard Rd	Other roadway change	Extension of Blanchard Rd to new Emado Ave extension		X		
Blanchard Rd	4-quadrant gate	2 vehicular arm gates, channelizers, 4 pedestrian arm gates and exit swing gates.				X
Monterey Rd	Alignment change	Realignment from Blanchard Rd to Cochrane Rd		X		
Emado Ave	Road closure	Closure of Emado Ave intersection with Monterey Rd		X		X
Emado Ave	Other roadway change	Extension of Emado Ave to Santa Teresa Blvd		X		
Charter Access Rd	Alignment change	Realigned access road to charter school		X		
Richmond Ave	Road closure	New cul-de-sac, widen road by adding shoulders				X
Fox Ct	Other roadway change	New Fox Ct north of closed Fox Ln, extens from Doughtery Ave		X		X
Fox Ln	Road closure	Road closure		X		X
Palm Ave	Other roadway change	Removal of designated left turn from southbound Monterey Rd	X			
Palm Ave	Grade separation	Palm Ave depressed and realigned to access Monterey Rd from opposite side of roadway		X		
Palm Ave	4-quadrant gate	2–4 vehicular arm gates, channelizers, 50-ft raised median, 4 pedestrian arm gates and exit swing gates				X

At-Grade Crossings

Depending on the configuration of the existing at-grade crossing, one of eight different four-quadrant gate applications (illustrated on Figure 1 through Figure 4) would be installed at each of the 29 at-grade crossings in the San Jose Diridon Station Approach, Monterey Corridor, and Morgan Hill and Gilroy Subsections under Alternative 4. Table 3 shows the number and locations of four-quadrant gate applications. These applications specify the improvements at each at-grade crossing, including the number of vehicle and pedestrian gates, and the need for channelization or raised medians. Table 3 also shows five existing at-grade crossings that would be closed: three private roads, one public road, and one pedestrian crossing.

At four crossings (Blanchard Road, Palm and Live Oak Avenues in Coyote Valley, and Bloomfield Road south of Gilroy) within identified wildlife crossing corridors, additional features would be added at the grade crossings to deter wildlife from encroaching into the fenced guideway. These features would be placed across the guideway between the access control fencing and between the tracks as a deterrent to wildlife entering the track bed.

Table 3 Number and Locations of Four-Quadrant Gate Applications

1 INTRODUCTION

This summary provides background information on the intended service and operations of the California High-Speed Train (HST) System to provide sufficient detail for the environmental assessment of proposed HST operations. Recognizing that the California system is still at a relatively early stage of the planning process, and that many operational issues remain to be resolved, this section summarizes how the system is envisioned to operate at this point in project planning.

Inspired by successes of high-speed train systems around the world, California has been planning a statewide high-speed rail line that will serve as a backbone and a needed alternative to the state's existing transportation network. The system will interface with and complement other modes of transportation – commercial airports, mass transit, the state's highway network, bike paths and pedestrian traffic. It will be capable of 220 mph revenue operating speed. It will interconnect with other modes of transportation and provide an environmentally friendly alternative to vehicle and air travel.

The updated phasing strategy for the California HST System will initiate revenue service between San Jose in the Silicon Valley and north of Bakersfield in the Central Valley in 2025. In the event that some additional funding can be made available this initial service may be extended to operate between San Francisco 4th and King Station, Merced and Bakersfield.

Phase 1 will be realized in 2029 with the expansion of the system to Los Angeles and Anaheim (See Table 1-1).

Proven train technologies similar to those used in other countries with established high-speed train systems (for example: Japan, France, Germany, Great Britain, Spain, Korea and China) will be used. This technology includes steel-wheel-on-steel-rail, entirely electric power, state-of-theart safety and signaling systems, and automated train control. This technology, although new to North America, was introduced in Japan in 1964, France in 1981, and in many other countries within the past two decades.

The HST will operate primarily on exclusive (dedicated) track with portions of the route shared with other existing passenger rail operations. The route (alignment) will be constructed either atgrade, in an open trench, in a tunnel, or on an elevated guideway, depending on the terrain, physical constraints, environmental impacts and community input along each section. The system will predominately be within, or adjacent to, existing rail or highway right-of-way to reduce potential environmental impacts and minimize land acquisition.

Table 1-1 Summary of Phased Implementation

Section	Length (Approx.)	Endpoints	Service Description	Planning Schedule
Valley to Valley	250 miles	San Jose and north of Bakersfield	▪ One-seat ride from San Jose to north of Bakersfield ▪ Begins with construction of up to 130 miles of high-speed rail track and structures in Central Valley. ▪ Private sector operator. ▪ Ridership and revenues sufficient to attract private capital for expansion. ▪ Connects with enhanced regional/local rail for blended operations with common ticketing.	2025

Section	Length (Approx.)	Endpoints	Service Description	Planning Schedule
Valley to Valley (extended)	300 miles	San Francisco to Bakersfield and Merced	▪ One-seat ride between San Francisco and Bakersfield and Merced ▪ Shared use of electrified/upgraded Caltrain corridor between San Jose and San Francisco 4th and King station.	2025
Phase 1	500 miles	San Francisco to Los Angeles/Anaheim	▪ One-seat ride between San ▪ Francisco and Los ▪ Angeles/Anaheim.[1] ▪ Dedicated high-speed rail infrastructure between San Jose and Burbank Station. ▪ Shared use of electrified/upgraded Caltrain corridor between San Jose and San Francisco Transbay Transit Center, and between Burbank and Anaheim ▪ Upgraded Metrolink corridor from LA to Anaheim, including remodeled Los Angeles Union Station (delivered by the Link US program)	2029

[1] One-seat ride means that passengers do not need to switch trains, even if the train operates over two systems (e.g., moving north on dedicated high-speed rail infrastructure and then moving onto Caltrain tracks at San Jose, assuming electrification of Caltrain corridor by 2019 as proposed by Caltrain)

2 SERVICE PLAN OVERVIEW

2.1 Implementation Phasing

Valley to Valley (V2V) - The implementation of the High-Speed Rail System will be accomplished in phases beginning with an initial section that extends from San Jose in the Silicon Valley to a temporary terminal north of Bakersfield in the Central Valley. Expected to be completed by 2025, this 250-mile section will support the operation of 44 train runs a day.

Valley to Valley extended (V2VE) – this option, which is subject to securing additional funding, will see the system expanded north to San Francisco and south into Bakersfield. This 300-mile system is also expected to operate at a level of 44 train runs per day with additional service between San Jose and Merced.

Phase 1 – The system will expand to 500 miles and include service between San Francisco to Anaheim at a level of 176 revenue service train runs a day.

3 SERVICE PLANS

Concept level rail operations and service plans have been developed to serve several purposes:

- Confirm the level of service assumptions (travel times and service frequencies between station pairs) used to develop the estimates of system ridership and revenue.
- Validate the operational feasibility of the desired level of service at a conceptual level.
- Identify operable patterns of train service, particularly the general requirements for non-stop or limited-stop trains to pass slower trains that need to make a greater number of (local) stops along the route (i.e., the locations and frequencies of occurrence of these "overtakes" at various times of day).
- Provide a basis for an order of magnitude estimate of the number of train sets and overall rolling stock fleet requirements for the full build-out.
- Provide a basis for estimating platform track and storage track capacity to support operations at the end terminal stations.
- Provide a basis for sizing train storage and maintenance facilities throughout the HST System.
- Provide a basis for planning passenger-handling operations at HST stations, which can be used to help size and configure station facilities.

The HST System ridership and revenue estimates are used in developing the operations and service plans so the level of service that would be provided at each station is generally equivalent to the level of service assumed in developing the ridership and revenue estimates for the HST System. Weekday ridership demand is assumed to reach peak levels during a three-hour period in the morning and again in the afternoon. Train service density would be greatest during these periods, reverting to a slightly lower level of service during the remainder of the day.

Currently, the proposed mix of services would offer regular clock-face patterns, with each service type leaving passenger stations at the same time each hour, with relatively limited exceptions. Slightly more service is assumed during the three hour peak periods in the morning and late afternoon than during off-peak hours, consistent with expected ridership peaking.

Trains would run in diverse patterns between various terminals. Three basic service types are envisioned:

- Express trains, which would serve major stations only, providing fast travel times.
- Limited-stop trains, which would stop at selected stops along a route to provide faster service between stations served.
- All-stop trains, which would focus on regional service and connection from/to faster trains.

In early phases of revenue service, the service is generally structured with all-stop trains. As the system expands, limited-stop and express trains are introduced. In Phase 1, the vast majority of trains would provide express services or limited-stop service and offer a relatively fast run time between the largest metropolitan areas while connecting various intermediate stations by all-stop service. Stations with higher ridership demand potential would generally be served by more trains than those with lower estimated ridership demand.

The service plan provides direct train service between most station pairs at least once per hour. Certain routes may not always be served directly, and some passengers would need to transfer from one train to another at an intermediate station, such as Fresno Station and Los Angeles Union Station, to reach their final destination.

These service plans provide a useful initial estimate of the level of service that matches projected long-range demand on the HST System. As the HST System is implemented and both the operating plan and the ridership estimates are refined, it will be possible to make informed benefit

and cost tradeoffs to develop the most appropriate mix of limited, express and all-stop services, which will affect the trip times between stations and the frequency of service offered at each station for each route.

3.1 Valley to Valley and Valley to Valley Extended (2025)

Both of these scenarios for the train service would include trains operating over a subset of the routes listed later for the Phase 1 network. Figure 3-1 provides an illustration of the types of service and the number of trains of each type of stopping patterns that would operate under the V2VE option in the year 2025. If only V2V were adopted, then the service would start at San Jose and terminate at a temporary station just north of Bakersfield. The service level for both would be limited to one train per hour in each direction throughout the day with a second train per hour during the peak periods. A service diagram can be found below for illustrative purposes only.

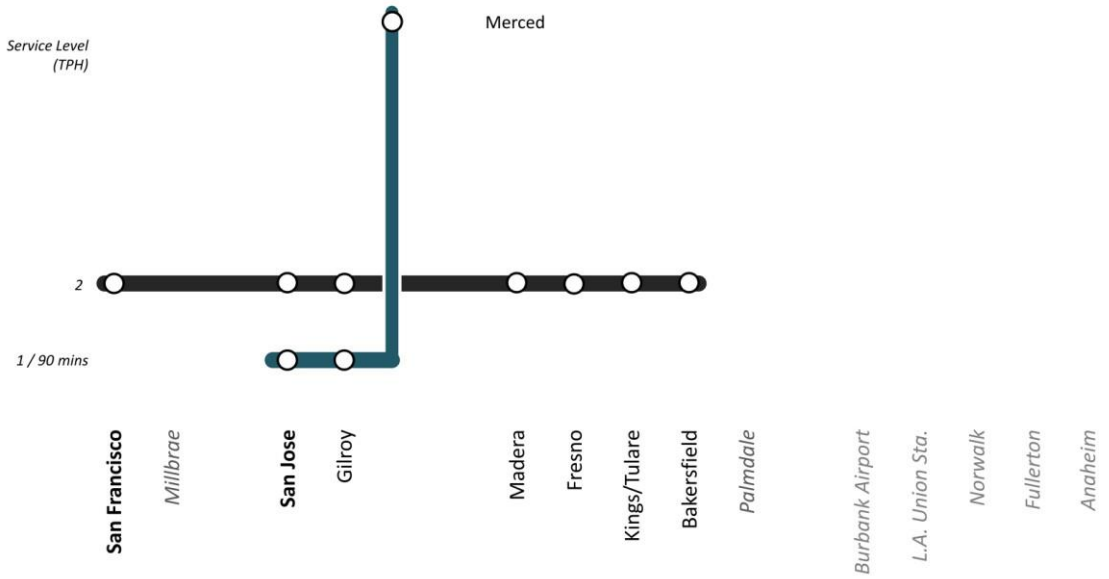

Figure 3-1 Valley to Valley Extended Train Stopping Patterns (2025: Peak Period Service)

3.2 Phase 1 (2029)

The service plan concept for Phase 1 estimates that the main HST line through the Central Valley would have eight trains per hour in each direction during the peaks, and five trains per hour during the off-peaks. Due to capacity constraint coming from the shared-use operations between Caltrain regional rail service and the high-speed rail service, the level of high-speed rail service along the Peninsula Corridor would be limited at four trains per hour in each direction throughout the day.

In the peak periods, the base level of service would include:

- Two trains per hour between San Francisco and Los Angeles
- Two trains per hour between San Francisco and Anaheim
- Two trains per hour between San Jose and Los Angeles
- One train per hour between Merced and Los Angeles
- One train per hour between Merced and Anaheim

Trains between the same terminal stations would have varying end-to-end stopping patterns. For example, one of the San Francisco to Anaheim trains would be all-stop and the other would be limited stop.

During off-peak periods, the base level of service would include three trains per hour between San Francisco and Los Angeles, one train per hour between San Francisco and Anaheim, and one train per hour between Merced and Anaheim in each direction.

Figure 3-2 shows potential stopping patterns for Phase 1, for illustrative purposes only.

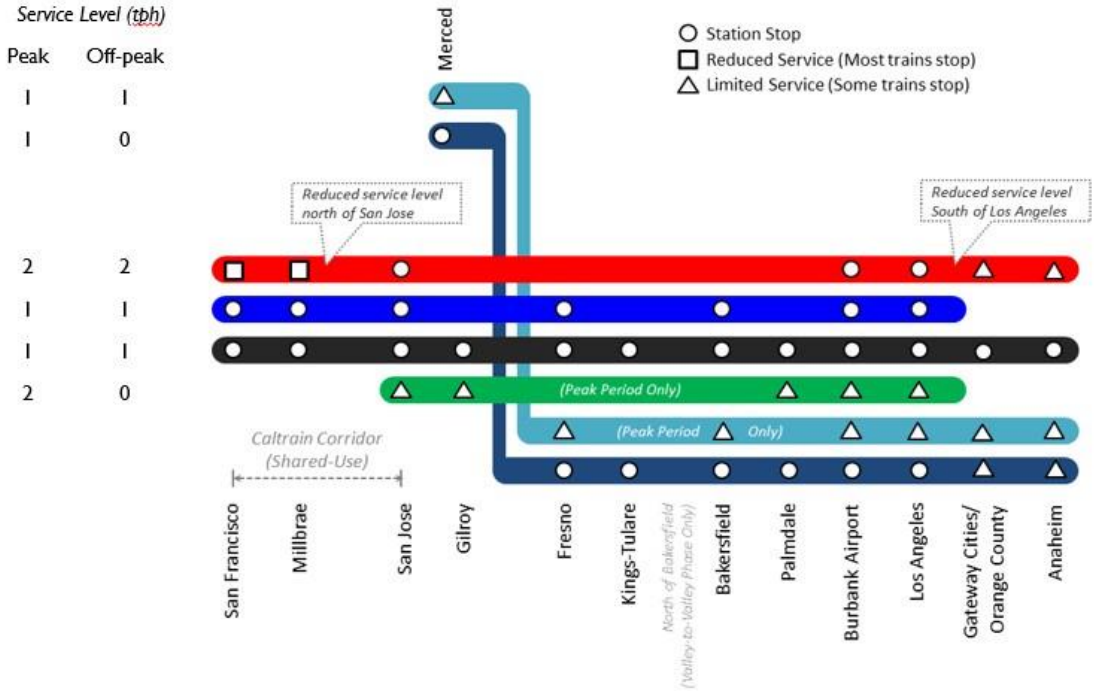

Figure 3-2 Phase 1 Train Stopping Patterns (2029)

4 PASSENGER STATION OPERATIONS

The Phase 1 service plan encompasses 13 passenger stations, including eight intermediate stations and five terminal stations. The V2V service plan (expected to be operational in 2025), envisions three intermediate and two terminal stations. The V2VE service plan, if adopted, envisions five intermediate stations and three terminal stations.

Station platforms are assumed to be 800 feet long. In accordance with Code of Federal Regulations (CFR) regulations that require that platform design meet the Americans with Disabilities Act (ADA) Accessibility Guidelines, the HST platforms will be designed to allow for level boarding.

4.1 Intermediate Stations and Platform Tracks

All the intermediate stations in the exclusive, dedicated sections of the high speed system incorporate platform tracks for stopping trains. Stations are spaced about 50 miles apart in rural areas and approximately 15 miles apart in metropolitan areas, with overall average spacing about 30 miles.

Because the Los Angeles high speed rail station is both a terminal station and intermediate station in Phase 1, and a high-volume station, it has a special layout that incorporates intermediate and terminal station features. Full details of the layout of Los Angeles Union Station are still in development by the Link US program being led by Metro in which HSR is an active partner.

The typical intermediate station will have the configuration shown in Figure 4-1 and Figure 4-2, with platform tracks on the outside flanked by side platforms. The platforms will be high-level, tangent and will cover the full length of an 820 foot train, permitting level boarding through all train doors.

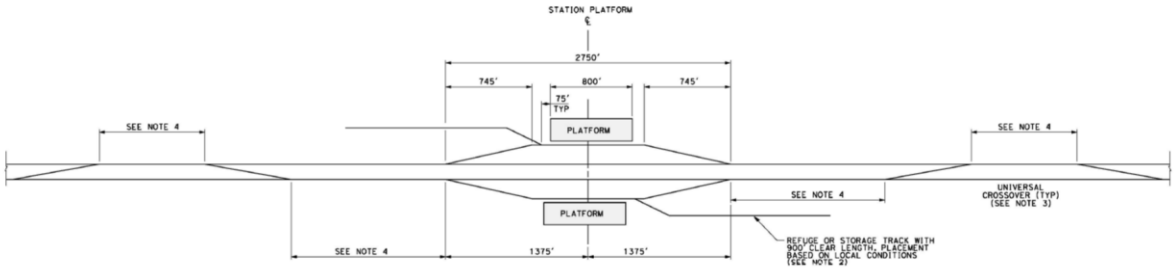

Figure 4-1 Intermediate Station Typical Configuration

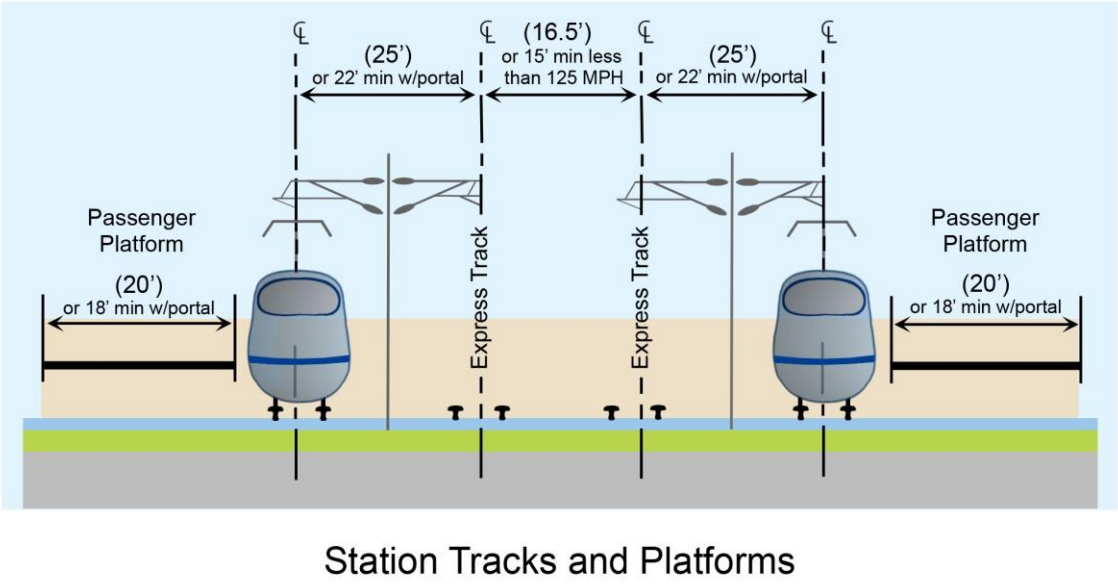

Figure 4-2 Intermediate Station Typical Cross-Section

4.2 Terminal Stations

Terminal stations are envisioned to have island platforms serving tracks on both sides and be able to accommodate train cleaning, restocking with on board food service, mandatory train inspection and as-needed maintenance and repair of trainset components – along with the alighting and boarding of passengers. The track and platform configurations at terminal stations vary based on the level of projected train service, local physical constraints, and requirements for other (non-HST) train services that would be located adjacent to the HST facilities. Figure 4-3 and Figure 4-4 show typical configurations for a four-track and six-track terminal.

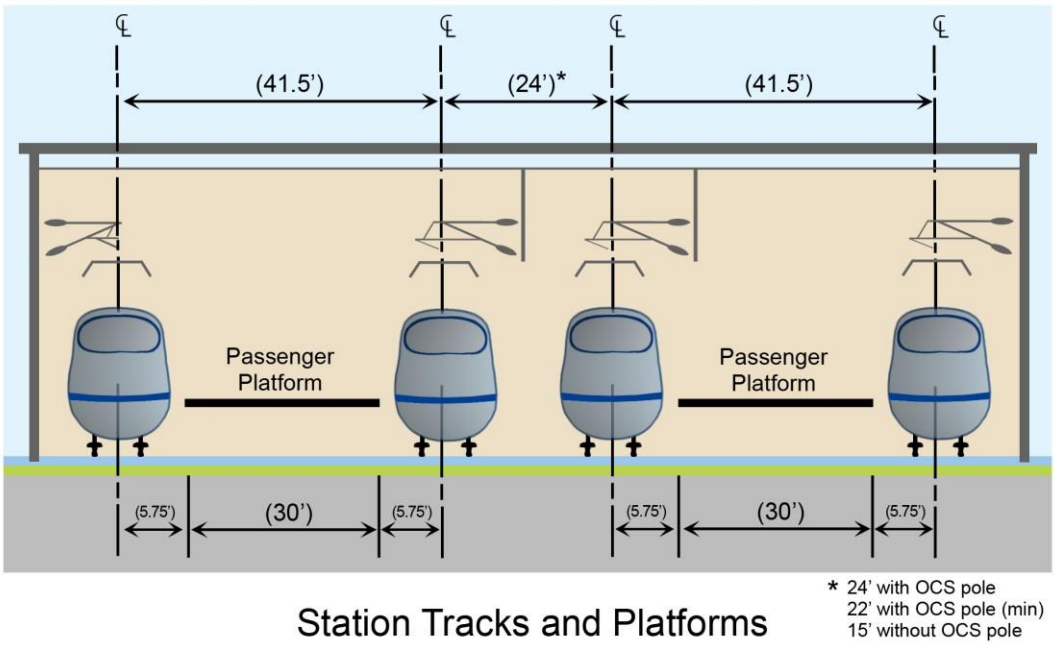

Figure 4-3 Terminal Station—4 Track Terminal and 2 Island Platforms

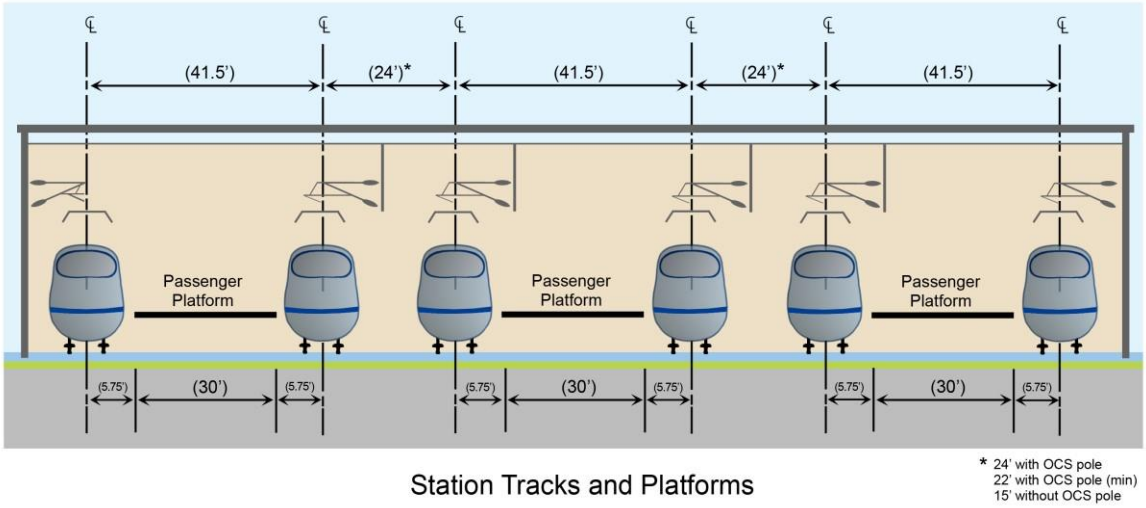

Figure 4-4 Terminal Station—6 Track Terminal and 3 Island Platforms

4.2.1 Passenger Boarding

There are several different ways in which passenger boarding could be managed at HST terminal stations. The HST project has not finalized the preferred methods for passenger-handling system wide, and the HST sponsors and operator likely will want consistent passenger handling practices across the entire system. Passenger-handling requirements affect the design and configuration of the physical facilities used for passenger-processing, waiting, queuing and horizontal and vertical circulation.

Examples of potential variations in passenger-handling procedures and required facilities encompass the following:

Advance staging of boarding passengers

- Retain all boarding passengers at concourse level until cleaning/servicing is substantially complete and the train is ready for boarding
- Permit boarding passengers to descend to platform level as soon as the load of detraining passengers has cleared the platform (passengers and service personnel and equipment would occupy the platform level simultaneously)

Number and location of boarding concourse points

- Board from a single concourse location
- Board from dual locations
- Board from multiple locations spread along a mezzanine or longitudinal concourse situated above or below the platform level, with multiple vertical circulation connections to the platforms

Reserved seat policy

- Open seating, where passengers select the car that they will board

Reserved seating (similar to most European and Asian high-speed rail systems), where passengers are assigned to a seat in a particular car, and where the time required to board the train can be minimized by pre-positioning passengers either on the platform or at concourse level close to where their seat will be located.

These options have differing implications in terms of required facilities, the configuration of concourse and vertical circulation elements, and the station operating costs associated with managing the boarding process.

4.2.2 Train Cleaning and Servicing

At terminal stations, train servicing would be done using the passenger platforms. Because of space constraints at the proposed terminal sites, dedicated service platforms are not envisioned. To maximize passenger safety, servicing operations efficiency, and achieve predictable layover (train parking) times, normal operating procedures would plan for providing temporal separation between the passenger unloading and loading processes and train servicing activities at the terminal platforms.

To attract and keep a dedicated passenger clientele it is important to establish and maintain a cleanliness standard aboard the train consists. This service is accomplished by cleaning techniques implemented at selected times in a service day. Two types of cleaning are envisaged.

- "Normal" (Lay-up) Cleaning – This service is performed at a train storage and maintenance facility, and is generally done when a train is parked for a sufficient time to receive a thorough interior cleaning of the passenger areas to include seats and bathrooms. It is usually scheduled daily and is completed prior to a train entering revenue service in the morning. All trash is removed, seats and floors cleaned, and bathrooms sanitized.
- "Light" (Pick-up) Cleaning – When a train turns around (i.e. the rear end of the train arriving at the station becomes the front end of the train departing) in a terminal station or on a storage track with insufficient opportunity for a full normal cleaning, this service is performed to return the interior to an acceptable condition.

Cleaning toilets (and emptying the "holding" tanks) would occur during the overnight layup period at maintenance facilities and would not occur in the terminals during the turnaround time.

4.2.3 Train Layover Times at Terminal

Because the terminals are stub-ended, all HST trains will change directions (turnaround with rear end of the arriving train becoming the front end of the departing train) at terminal stations. Three types of train turnaround will occur in terminal stations:

- Revenue to Non-Revenue: Revenue trains (with passengers) arrive, with the equipment turning around and going to the maintenance facility for storage or servicing, without passengers.
- Non-Revenue to Revenue: Trains enter the terminal from the maintenance facility (without passengers), departing passengers board (the train), and the train departs as a revenue train (with passengers).
- Revenue to Revenue: Revenue trains (with passengers) arrive and passengers unload, the train would park at the platform while it is inspected, cleaned and restocked with bathroom and food service supplies, departing passengers board the train, and the train departs as a revenue train (with passengers).

Estimating the time required to carry out the various terminal turnaround train servicing and passenger processing functions, and identifying which functions can proceed in parallel with each other and which depend upon the prior completion of other activities, allows definition of a "critical path" of activities that governs the minimum time necessary between an inbound train arrival and the subsequent outbound train departure. The required sequence that must be followed for four basic processes that occur during the turnaround layover period are as follows:

- Passenger alighting and boarding
- Re-stocking of food and beverage service items
- Coach cleaning and re-stocking of bathroom supplies (critical path item)

- Train safety system pre-departure preparation
- In addition, minor equipment repairs that can be accomplished during the layover (parking) period will be addressed.

Facilities would need to be provided at the terminals to support the food service provisioning (commissary), coach cleaning and railroad mechanical department (equipment maintenance and repair). These facilities would need to be located in proximity to the HST platforms, to minimize the time required to access a train when it arrives at the terminal. Direct service elevator access would be required between these facilities and the HST platforms, separate from the elevators and access points used by passengers.

The HST scheduled terminal station turnaround time is composed of four primary "critical path" factors: Passenger alighting, interior cleaning, passenger boarding, and a "Recovery Time Factor." The following table summarizes HST assumptions for the minimum exception and minimum standard scheduled turnaround times (based on an 820 foot train).

Table 4-1 Time Required for Terminal Layover Activities (HST Planning Assumptions, Revenue Train to Revenue Train)[2]

Critical Path Activity	Minimum Exception	Minimum Standard
Passenger Alighting	5 minutes	5 minutes
Cleaning, Restocking, Servicing & Provisioning	5 minutes	10 minutes
Passenger Boarding "Window"	5 minutes	5 minutes
Total Scheduled Turnaround Time Assumption	15 minutes	20 minutes

[2] Train safety system preparations can be accommodated within time windows available for alighting, cleaning and boarding.

5 ROLLING STOCK STORAGE AND MAINTENANCE

5.1 Fleet Requirements

In 2040, 78 train sets will be required to operate the 176 daily revenue service train runs envisioned for the full build revenue service plan. Each train set is approximately 650 feet long and seats approximately 500 passengers in the initial formation. The train could be potentially extended to 820 feet long and seats approximately 650 passengers.

Table 5-1 Horizon Year 2040 (Phase 1) Service Plan. Revenue Train Sets Required at Each Terminal to Start Weekday Morning Train Service.

Terminal	Total Single Sets
San Francisco – Transbay	13
Mid-Peninsula (San Jose and Gilroy)	14
Central Valley (Merced, Fresno, and Bakersfield)	13
Los Angeles Basin (Palmdale, Burbank Airport, Los Angeles Union Station, and Anaheim)	31
Total Sets Required	**71**

The Horizon Year 2040 operations and service plan envisions the need for 71 revenue train sets. Also as indicated in Table 5-2, the estimated number of trainsets along with an allowance for spare train sets for maintenance and repair substitute and hot stand-by trainsets, and extra trainsets to accommodate higher demand on peak demand days, resulting in an overall fleet estimate of 78 total units. The 10% total spare ratio is the mid-range of spare ratios for U.S. and international intercity and high-speed rail fleets. The estimated fleet requirement numbers will be modified as the operating plan, demand projections, and maintenance plans are refined.

Table 5-2 Horizon Year 2040 (Phase 1) Train Fleet Requirements

Trainset Description	Trainsets Required
For Single-set Trains	71
For Double-set Trains	0
Subtotal Revenue Requirement	0
Hot Stand-by	2
Extra Trainsets for Peak Demand Days	2
Spare Equipment (Assume 10%)	3
Total Sets Required	**78**

5.2 Train Storage and Maintenance Facilities

Train storage yard facilities should be located as close as physically possible to the terminal stations.

Generally, the terminal stations are in heavily urbanized areas that do not have land available immediately adjacent to the terminal for new train storage yards. As a result, trains that are entering or leaving service at a terminal station will have to operate as non-revenue or “deadhead” train movements to and from the storage yards.

The overnight layup facilities are the basic facility at each of the terminal locations that provide overnight storage (parking) for the trainsets and daily inspections and cleaning. Layup facilities would be located close to Gilroy Station but be without a heavy maintenance capability. Yards including a periodic inspection facility (shop) would be located in northern California along the Peninsula Corridor at Brisbane near San Francisco and one in southern California, near Los Angeles Union Station. One Heavy Maintenance Facility (HMF) will be located in the center of the statewide system to provide all of the overhauls and component refurbishment capability. An example of a typical concept configuration for an overnight storage facility equipped with a shop to perform periodic inspections is shown in Figure 5-1.

The storage capacity of each facility is based on the number of trains estimated in the Full Build-Out Operations and Service Plan and is summarized in Table 5-3 below.

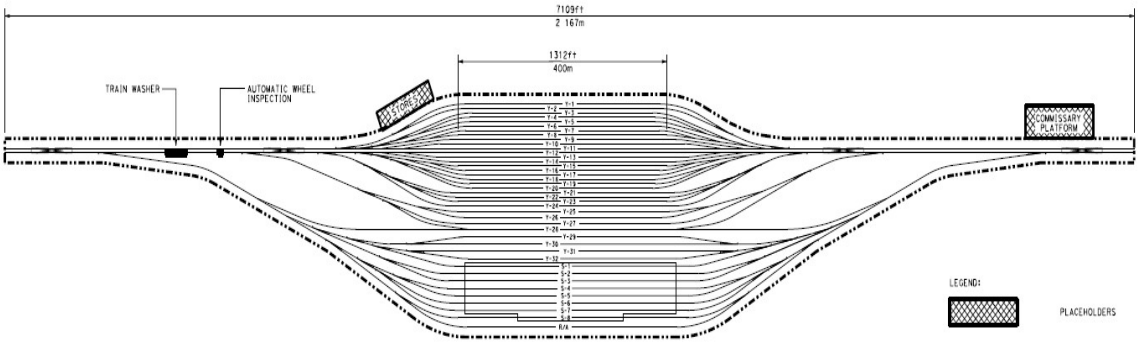

Figure 5-1 Example of Typical Concept Configuration for Overnight Storage Yard with Shop

Table 5-3 Phase 1 Blended Service (2040) Storage/Layup Track Requirements

Location	Total Trains to be laid up at facility	Train capacity at each facility*
Brisbane	14	14-18
Gilroy	13	13-16
HMF	23	23-27
Southern California	28	28-35
Total	**78**	**78-96**

*Excess capacity will allow flexibility to move trains around in order to meet actual level of demand

5.3 Rolling Stock Maintenance Program

Consistent with international methods, the California high-speed train system is planned to provide five different levels of train maintenance activity:

- Level 1 – In-Service Monitoring: daily testing and diagnostics of certain safety sensitive apparatus on the train in addition to automatic on-board and on-ground monitoring devices.
- Level 2 – In-Service Examinations: inspections, tests, verifications and “quick” replacement of certain components on the train. Examples include inspection and maintenance tasks associated with the train’s running gear, bogies, underbody elements and pantographs.
- Level 3 – Periodic Inspections: part of planned preventive maintenance program requiring specialized equipment and facilities. Examples include: a) examination of interior fittings and all parts of the train in the immediate environment of the passengers, b) in depth inspection of axles and underbody components, critical to train safety by identifying and repairing any

condition in the running gear and connecting components, c) wheel condition diagnostics and re-profiling (wheel truing).

- Level 4 – Overhauls (HMF only): part of the planned life cycle maintenance program requiring a specialized heavy maintenance shop with specific heavy duty equipment. Activities include the complete overhaul of train components replaced during Level I, II and III. In addition, a full complement of heavy maintenance is completed on each trainset every 7 to 10 years (30 days per trainset) as well as mid-life overhauls which are performed on each trainset every 15 to 20 years (45 days per trainset).
- Level 5 – Rolling Stock Modifications & Accident Repair (HMF only): Activities to support installation of a major modification to the design of the trainset for purposes of improving safety, reliability and passenger comfort. In addition, this category includes repair to a trainset which has “suffered” significant damage.

The frequency with which these maintenance procedures are performed varies by level. To minimize cost, maximize flexibility and to address all of the levels of maintenance and inspections, these maintenance functions will be undertaken at a relatively small number of facilities spread across the HST network. The locations at which maintenance will occur can be broken into three groups:

- Overnight Layup Facility – Provides Levels 1 and 2 maintenance and inspections
- Periodic Inspection Facility – Provides Levels 1 to 3 maintenance and inspections
- Heavy Maintenance Facility – Provides Levels 1 to 5 maintenance and inspection, including overhauls and component refurbishment.

5.4 Facility Site Location Criteria

It is important that each of these facilities be located immediately adjacent to the HST main line tracks and connected directly to them with a 110 mph turnout (switch) and two connecting tracks

(i.e., “double track”) of approximately 3,696 feet on both ends of each facility. The connecting tracks will transition to become the slow speed (15 mph) lead tracks within each facility.

In addition to proximity and connectivity to the HST System main line tracks, the site of the Light Maintenance facilities should be such that the distance between the light maintenance facility and the Terminal Stations is minimized. The preferred distance is up to 1.5 miles, an acceptable distance is from 1.5 to 3.0 miles and anything further than 3.0 miles would be considered as an exception. Light Maintenance Facilities (LMF) are required for the terminus stations or end points of the system at San Francisco, Los Angeles, Anaheim and Merced for Phase 1, with additional LMFs at San Diego and Sacramento for the Full Build-Out. In addition, consideration is being given to a possible combined LMF for Los Angeles and Anaheim.

The desirable site for the Heavy Maintenance Facility (HMF) is that it be located centrally on the HST System between Merced and Bakersfield. The section between Merced and Bakersfield is in the “central part” of the system, is part of the trunk line (Anaheim-San Francisco), and has the ability to include a high-speed test track. No other part of the system meets these criteria. The required length of this test track is based upon current high-speed train manufacturers’ recommendations for testing and commissioning which includes a protocol for sustained running for ten minutes up to 250 mph. Train operations at these speeds require straight alignment of approximately 80 to 105 miles.

5.5 Estimated Site Requirements

Based on a conceptual rendering of these facilities they would require the following land parcel “footprints” range (depending on the shape of the land parcel), inclusive of buildings, outdoor service areas, storage, roadways and parking:

- Merced to Bakersfield Heavy Maintenance Facility Concept, 169 +/- Acres

- Los Angeles Storage Yard and Maintenance Facility Concept, 100 +/- Acres
- Brisbane Storage Yard and Maintenance Facility Concept, 100 +/- Acres
- San Jose/Gilroy Storage Yard and Maintenance Facility Concept, 42 +/- Acres

5.6 Commissioning of Rolling Stock

In addition to the in-service maintenance regimen, the HMF is assumed to be used during the pre-revenue service period (from 2020) for the assembly, testing, acceptance, and commissioning of the HST System new rolling stock fleet. Implementation of the testing, acceptance and commissioning activity would also require a main line test track between 80 and 105 miles in length connected directly to the HMF. The HMF would also be used for decommissioning or retirement of equipment from the system to make way for the next generation of rolling stock.

6 TRAIN DISPATCHING AND CONTROL

6.1 Operations Control Center

A train operations control center will be located in the Central Valley area. Space for employee parking, pedestrian access/egress and appropriate bathroom and lunchroom facilities has been accounted for. However, the operations control center can be located at any place along the system.

6.2 Communications with HST Stations

HST trains will be dispatched and controlled from a central control facility remote from the individual stations and terminals. A direct communications link will exist between the central control facility and the Terminal Operations Center or HST Passenger Services office at each HST station and terminal, to enable station staff of the HST System Operator (and the Terminal Operator, at facilities where the terminal is managed by a third party) to monitor the status of train operations on the rail network and respond to any unusual conditions that may arise.

3 INTRODUCTION

3.1 Objectives

These requirements specify the Rail and Operations Delivery Branch (Rail Group) infrastructure requirements to meet the operational requirements of High-Speed Rail services between San Francisco and Gilroy and beyond as per the Authority 2018 Business Plan.

The requirements within this document are intended to describe a blended operations, overhead line electrified railroad, contained within the existing ROW, between San Francisco and Gilroy with a MAS of 110 mph.

These requirements are intended as guidance to the Northern California regional team and Consultants to facilitate the environmental clearance process.

Any changes or deviations from these requirements shall be documented and agreed with the Rail Group.

3.2 Scope and Applicability

This document and the requirements contained within it form the highest level of Rail Group requirements.

In order of precedence requirements shall be managed as follows;

1. San Francisco to CP Lick;
    a. HSR Design Standards;
    b. Caltrain Design Standards; then
    c. Sub-consultant generated options.
2. CP Lick to South of Gilroy;
    a. UPRR Standards
    b. HSR Design Standards;
    c. Caltrain Design Standards; then
    d. Sub-consulant generated options.

When the development of the project moves through the order of precedent listed above and referenced standards change due to local circumstances, the Rail Group shall be notified and shall agree a course of action prior to the development work progressing.

It is permissible to have multiple variations on the application of applicable standards used as the design moves along the alignment to suit local circumstances providing the proposal is coherent and compliant.

For the tracks between San Francisco and San Jose it is noted that there is prior agreement to amendments to the Caltrain Design Criteria for Track as detailed in the HNTB Submittal Memo from Kim Franchi, Subject ‘San Francisco – San Jose (FJ) Basis of Design (Track)’ dated 04/25/2018.

4 OPERATIONAL REQUIREMENTS

DRAFT – Operational Planning Analysis REVISED– San Francisco to Gilroy as per memo from Paul Hebditch to Frank Vacca dated July 27, 2018 applies. Revisions to this memo are to clarify points made in the original and to provide operational context. See Appendix 1,

4.1 2027 Peninsula Service

1. San Francisco – San Jose
    a. San Francisco 4th & King temporary Station platform lengths in accordance with Rail Systems Directive 2017-03-06-01 Rev 4a dated 1/29/2018;
    b. Grade separated rail access to Brisbane LMF;
    c. All at-grade crossings converted to four quadrant gates with channelization to permit operations up to 110 mph;
    d. No additional grade separations by HSR;
    e. Hold-out rule eliminated at College Park, Broadway and Atherton;
    f. MAS shall be 79 mph;
    g. No changes to CEMOF;
    h. San Jose Diridon Station at-grade (as described in directive);
        i. Two High-Level HSR Platforms with four adjacent tracks;
        ii. 1,400’ between fouling points of switches at both ends;
    i. Track configuration from CP Coast to Diridon;
        i. Two electrified tracks;
        ii. Two non-electrified tracks;
    j. Completely access controlled ROW using fences, trespass guards and quad-gates.
2. San Jose – Gilroy
    a. At-Grade within existing ROW;
    b. One non-electrified track (MT1), two electrified tracks (MT2 and MT3);
    c. San Jose Diridon Station at-grade;
        i. Two High-Level HSR Platforms with four adjacent tracks;
        ii. 1,400’ between fouling points of switches at both ends;
    d. Tamien Station;
        i. No change to station layout or platforms;
        ii. Two electrified sidings located south of Tamien Station (min 700’ long);
    e. Michael Yard;
        i. Stabling for minimum of four 7-Car trainsets (7-car max length = 675’);
        ii. Non-electrified;
        iii. The two long Michael Yard tracks shall be double ended from MT1;
    f. Southbound 50 mph crossovers for connecting MT1 to MT2 - These may be located in a suitable location north of Blossom Hill Station;
    g. Quarry siding;
        i. Access from MT3 from south as per existing access;
        ii. To enable access to the Quarry from MT1, 30 mph crossovers shall be provided between MT1 and MT2 and MT2 and MT3;
    h. Coyote;
        i. One non-electrified siding at Coyote (min 2,500’ long). This may extend up to 4000’ if achievable within the existing ROW.

i. Gilroy at-grade station;
    i. As detailed in 'Rail Systems Directive 2017-03-06-01 Rev 4a dated 1/29/2018', two high-level platforms shall be provided and they shall be the maximum length that can be provided within platform track;
    ii. Two low level platforms minimum length 600' each;
    iii. Three electrified storage tracks (to replicate existing length);
    iv. 'TAMC' track shall tie into MT1 south of the station;
    v. Relocate the storage tracks to the 2033 location per direction from the Rail Group on 6/15/2018. See Appendix 2;
    vi. Northbound 50 mph crossovers for connecting MT2 to MT1;
j. Gilroy MOWF. Two options to be considered;
    i. South of Gilroy (no Gilroy LMF) - for early operations in 2027, HSR trains may use UPRR tracks to gain access to the MOWF from the North; and
    ii. Adjacent to Gilroy Station - use existing land within the Gilroy station area.
k. These options shall allow;
    i. Rail access from UPRR tracks for delivery of construction and maintenance materials;
    ii. Laydown areas for storage of construction and maintenance materials;
    iii. Stabling for railway equipment;
l. All at-grade crossings converted to four-quadrant gates with channelization (or closed) to allow operation to 110 mph;
m. No new HSR grade separations;
n. Reconfigure VTA/Caltrain stations at San Martin, Morgan Hill, Blossom Hill and Capitol to be accessed from MT2 and MT3; and
o. Completely access controlled ROW using fences, trespass guards and quad-gates.

4.2 2029 Valley to Valley Service

1. San Francisco – San Jose
    a. No changes required to infrastructure provided for 2027 operations.
2. San Jose – Gilroy
    a. Reconfiguration of Gilroy station and connecting tracks southward to connect with dedicated HSR alignment and provision of bypass tracks;
    b. 1,400' minimum distance between points of switch of the Gilroy platform tracks;
    c. HSR northern access to MOWF shall not utilize UPRR tracks as a permanent condition but may cross UPRR tracks; and
    d. MOWF shall have direct access to HSR Mainline tracks as well as connection to the existing freight railroad in order to facilitate access for delivery of materials and equipment.

4.3 2033 Phase One

1. San Francisco – San Jose;
    a. Increase MAS to 110 mph;
    b. Upgrade of signaling system (Note; all upgrades to signaling system in FJ segment by Caltrain not HSR); and
    c. Add HSR Millbrae Station.

2. San Jose – Gilroy
    a. No changes 2029 operations.

5 INFRASTRUCTURE REQUIREMENTS – SAN JOSE – GILROY

5.1 Outline

1. All connections to freight branch lines and local industry shall be retained with connection to MT1.
2. 101 Freeway - HSR and UPRR tracks to pass through existing under-bridge.

5.2 Right-of-Way

1. The Regional team are responsible for determining;
   a. ROW boundaries, including for earthworks;
   b. Provision of access roads and gates;
   c. Roadway modifications;
   d. Pedestrian overpasses;
   e. Grade crossings;
   f. System sites;
   g. Utility mitigation; and
   h. Associated environmental clearance.

5.3 Track

1. Two electrified tracks, MAS of 110 mph;
2. One non-electrified track, MAS of 79 mph;
3. Track spacing shall be as follows;
   a. Alignment shall be designed to fit, where possible, within existing ROW, based on;
   b. MT1 to MT2 – 20’ between track centers; and
   c. MT2 to MT3 – 20’ between track centers;
4. Where alignment, ROW or physical features prevent the above requirements from being achieved, the order of preference of track spacings shall be as follows;
   a. Reduce MT2 - MT3 spacing to 15’ minimum;
   b. Reduce MT1 – MT2 spacing to 18’ minimum; then
   c. Additional land take.
5. There shall be 10’ 8” minimum horizontal clearance between track centerline and the perpendicular face of any vertical obstruction.
6. All reductions in track spacing from those described in 5.3-2 a & b above shall be documented and approved by the Rail Group prior to design progressing; then

5.4 OCS

1. Electrification to terminate immediately north of ‘East 10th Street’ Grade Crossing unless the Gilroy storage tracks are relocated south of the crossing.
2. Clearance between the centerline of any track and the face of OCS structures shall be a minimum of 15’; and
3. The preliminary placement of portal structures is to be agreed with the Rail Group on completion of track alignment design.

5.5 Minimum Vertical Clearance

1. The minimum vertical clearances measured from top of rail (TOR) shall be 27'.

5.6 HSR Stations

1. In accordance with Engineering Directive Letter '2017-03-06-01 Rev 4', HSR Platform tracks shall be designed to allow 1,400' clear track from the fouling points of switch along adjacent lines; and
2. High-level platform face shall be as long as possible up to 1,400', but with a minimum length of 800'.

5.7 Caltrain Stations

1. There shall be no requirement for passing tracks to be provided at stations between San Jose and Gilroy;
2. Low level platforms shall be provided between the two electrified tracks for use by Caltrain and shall be provided to meet the 'Caltrain Design Criteria, Chapter 3 – Stations and Facilities';
3. Passenger access and egress shall be provided by pedestrian overpasses or underpasses and ramps to the platforms;
4. Pedestrian grade crossings shall not be allowed at station locations except at existing road / vehicle grade crossing;
5. Caltrain platform lengths shall be environmentally cleared for 700' ; and
6. A three-track gantry with OCS poles located outside the tracks is preferred. If site conditions require the use of OCS poles located in the middle of the platform, this shall be approved by the Rail Group prior to proceeding with design.

5.8 Grade Crossings

1. All at-grade road crossings shall be closed or converted to four-quadrant gates with channelization;
2. Where existing grade crossings have gates across adjacent pedestrian crossings these shall be provided;
3. At-grade pedestrian only crossings shall be closed and/or replaced with grade separated crossings;
4. The Rail Group shall take the lead role in coordinating with FRA/CPUC regarding requirements for at-grade crossings in this corridor;
5. The Regional team shall be responsible for environmental clearance of four-quadrant gates with channelization, or closing of grade crossings as applicable;
6. The Regional team shall be responsible for analysis of roadway impacts and modifications;
7. The Regional team shall be responsible for grade crossing gate downtime analysis;
8. The Regional team shall be responsible for all interfaces with local authorities, and Caltrans, with regards to modified road layouts associated with grade crossing modifications; and
9. The Regional team shall be responsible for environmental clearance of land associated with four-quadrant gate operational equipment located at each grade crossing.

5.9 Utilities

1. The Regional team shall be responsible for the identification and proposed relocation of all existing utilities including any required ROW impacts.
2. Opportunities for shared use of cable ducts shall be referred to the Rail Group on a case by case basis.

6 SYSTEM SITE CRITERIA

6.1 Traction Power

1. Site locations
    a. TPS locations shall be arranged, TPSS – PS(x) – SWS – PS(y) – TPSS, with x & y indicating the number of PS locations based on the distances involved;
    b. Distances between TPSS locations shall be approx. 30miles ±20%;
    c. Distances between TPSS and SWS shall be approx. 15miles ±25%;
    d. Distances between TPSS and PS, SWS and PS, PS and PS shall be approx. 5miles +50% / -10%;
    e. If any greater variance in distances is required, this shall be agreed with the Rail Group;
    f. TPSS locations shall be located adjacent to or near existing PG&E 115kV/230kV transmission lines or switching stations wherever possible;
    g. The Caltrain facilities 'TPSS 2', located at approx. MP46 and 'PS-7', located at approx. MP49, near Michael Yard, shall be assumed to be fixed points;
    h. 'TPSS 5' east of the Pacheco Pass tunnel and west of Interstate 5 shall be assumed to be a fixed point; and
    i. For staging purposes, the site of 'TPSS 4' shall be on the portion of the ROW between San Jose and Gilroy that is assumed to be electrified in the initial stage so power can be supplied to the railroad operating in 2027;
2. Sites are to be sized;
    a. Paralleling Station (PS) 120'x80';
    b. Switching Station (SWS) 160'x90';
    c. Traction Power Sub Station (TPSS) 200'x160'; and
    d. Any variance to these sizes shall to be agreed with the Rail Group prior to progressing;
3. Paved access;
    a. To be provided to facilitate both construction and ongoing emergency and maintenance access; and
    b. Parking at the system sites shall be in addition to the system facility size and as follows:
        i. Two parking spaces shall be provided at each TPSS location; and
        ii. Two parking spaces shall be provided at each PS or SWS location.
4. Phase breaks;
    a. Shall be positioned at TPSS and SWS locations; and
    b. The track gradient at phase break locations shall not exceed 0.6% for 4,000' (centred at the phase break location).

6.2 Communications / Radio Sites

1. System radio sites may be co-located with traction tower facilities;
2. Stand-alone radio sites shall be 40' by 25' (Per NTD 6);
3. System radio sites shall be 20' by 15' (when located as part of the combined system site);
4. System radio sites shall be cleared for the installation of radio masts up to 190' in height from ground level (NTD 6);
5. Suitability of all radio towers shall be investigated via FCC's TOWAIR tool (Per NTD 9); and
6. A single parking space shall be provided at each Stand-alone radio site location.

6.3 Automatic Train Control (ATC)

1. ATC system sites shall be located adjacent to where electrified tracks have interlockings.
2. ATC sites shall be 70'x 35'
3. Environmental clearance for ATC system sites shall be undertaken at;
    a. Tamien Station;
    b. Michael Yard;
    c. Capitol Station;
    d. Morgan Hill Station;
    e. San Martin Station;
    f. Gilroy Station; and
    g. Other locations where required.
4. An access road and one parking space shall be provided at each ATC location.

6.4 Positive Train Control

1. Environmental clearance for PTC system sites shall be undertaken where non-electrified tracks have interlockings at;
    a. Gilroy Station;
    b. Coyote Siding;
    c. Capitol Station;
    d. Michael Yard; and
    e. Other locations where required.
2. PTC system sites shall be 20' x 30'; and
3. One parking space for a single pick-up truck shall be provided at each location.

6.5 Grade Crossings

1. Each grade crossing shall require a 10' by 10' flat level area located at one corner of the grade crossing for the erection of an 8' x 8' x 8' equipment cubicle;
2. The location of the cubicle shall not obscure visibility to either road users, pedestrians or train operators / engineers;
3. One parking space for a single pick-up truck shall be provided at each location;
4. The area shall be safely accessible for maintenance; and
5. Barriers shall be provided across sidewalks to prevent pedestrian access to the ROW when the grade crossing gates are down.

Fig 1 – Typical quad-gate equipment layout.

7 APPENDIX 1

HIGH-SPEED RAIL: *CONNECTING AND TRANSFORMING CALIFORNIA*

Memorandum

DATE: July 27, 2018

TO: Frank Vacca, Director, Rail Group

FROM: Paul Hebditch, Lead Operations Planner, Rail Group

CC: Rebecca Kohlstrand, John Popoff, Simon Whitehorn, Boris Lipkin

SUBJECT: DRAFT – Operational Planning Analysis – San Francisco to Gilroy – REVISED

DRAFT

Purpose

This memo provides information pertaining to the operational planning analysis that has been undertaken to determine a schedule that may be operated once high-speed rail services commence operation between San Francisco and Gilroy as detailed in the California High-Speed Rail Authority (the Authority) 2018 Business Plan.

The memo includes an illustrative schedule[1] showing a two-hour peak period service plan for full Phase 1 operations commencing in 2033. The Authority do not currently anticipate an increase in the level of high-speed train operations between San Francisco and San Jose beyond that shown for full Phase 1.

The memo also describes the key track and system infrastructure parameters required to support the illustrative schedule.

Train service planning

The Authority and Caltrain have been meeting on a regular basis for several years to develop options for blended operations. The most recent work has been developed through joint working led by an independent rail timetabling consultancy.

[1] The schedule is illustrative as there may be variations in stopping patterns and trip times based upon refinements in information in some areas – e.g. market demand, trainsets, signal system, etc.

The working group has agreed upon the assumptions and parameters referred to below and used modern timetabling modelling software to refine its outcomes.

Caltrain and their tenants

Following the Peninsula Corridor Electrification Program, Caltrain will increase their peak train service frequency to 6 trains per hour per direction (tphpd) between San Francisco and San Jose. It is this level of service that has been used in development of the service plans for all phases of high-speed train operation ramp-up. Based upon input from Caltrain, some stopping patterns have been changed to better meet expected market demand.[2]

Caltrain also currently operate three trains from Gilroy to San Jose in the morning peak and three trains from San Jose to Gilroy in the evening peak. All these services stop at all the intermediate stations. Once the Authority have completed the upgrade and electrification of two tracks in the current Union Pacific Rail Road (UPRR) right-of-way between CP Lick and Gilroy, there will be 12 train slots per hour per direction available for electric trains. Eight of these will be utilized by high-speed electric train services running non-stop between San Jose and Gilroy.

The remaining four train slots will be available for electric trainsets to operate to provide services between San Jose and Gilroy. These train slots will reduce journey time between San Jose and Gilroy by 27 minutes over today's service but, will only be able to call at 3 of the 5 intermediate stops. Therefore, to provide the same level of service as today will require 6 skip-stop trains to operate.

Capitol Corridor services operate between CP Coast and San Jose. Provision for up to 2 tphpd have been included in the assessment of platform capacity at San Jose station.

Altamont Corridor Express (ACE) services operate between CP Coast and Michael Yard at Tamien. Provision for up to 4 tphpd has been included in the assessment of platform capacity at San Jose station and of track capacity south of San Jose on the non-electrified tracks.

[2] Full details of market demand and stopping patterns will be in Caltrain's Business Plan due for publication in Q1 2019.

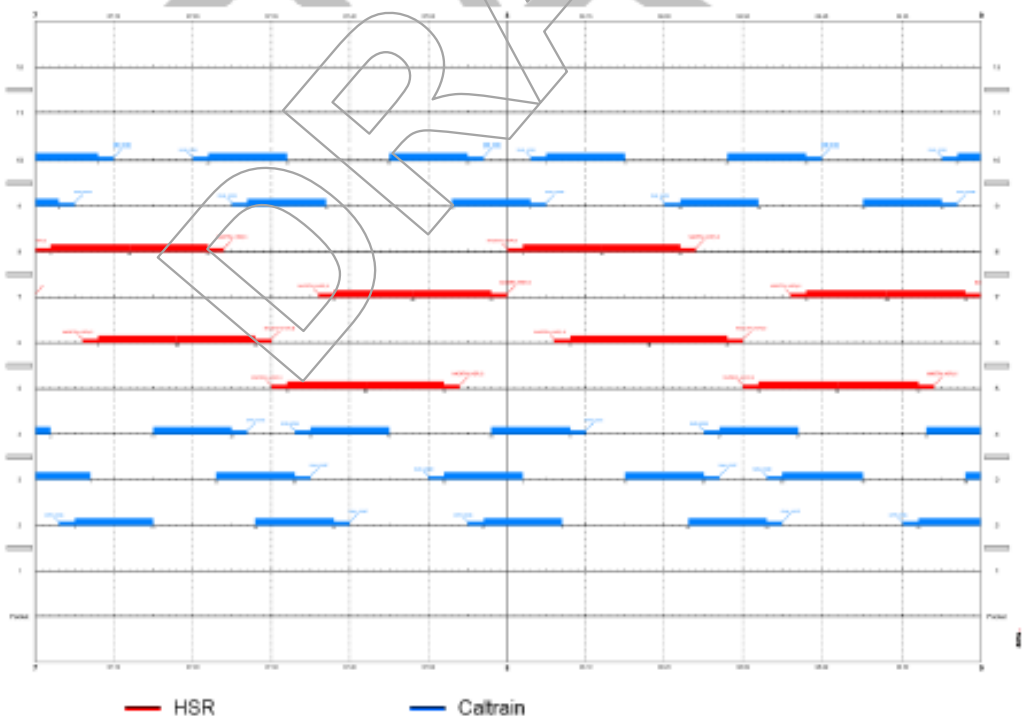
DRAFT

San Francisco – 4th and King Station

The illustrative schedule that has been developed can be accommodated in the existing layout at San Francisco 4th and King station. Proposed platform allocations are:

Platform	Track(s)	Platform height	Service(s)
1	1	Low level	
	2	Low level	Caltrain
2	3	Low level	Caltrain
	4	Low level	Caltrain
3	5	High level	High-speed
	6	High level	High-speed
4	7	High level	High-speed
	8	High level	High-speed
5	9	Low level	Caltrain
	10	Low level	Caltrain
6	11	Low level	
	12	Low level	

The diagram below shows station working in the peak hours 0700-0900:



This proposal maintains Caltrain's ability to undertake their non-revenue activities in the station area.

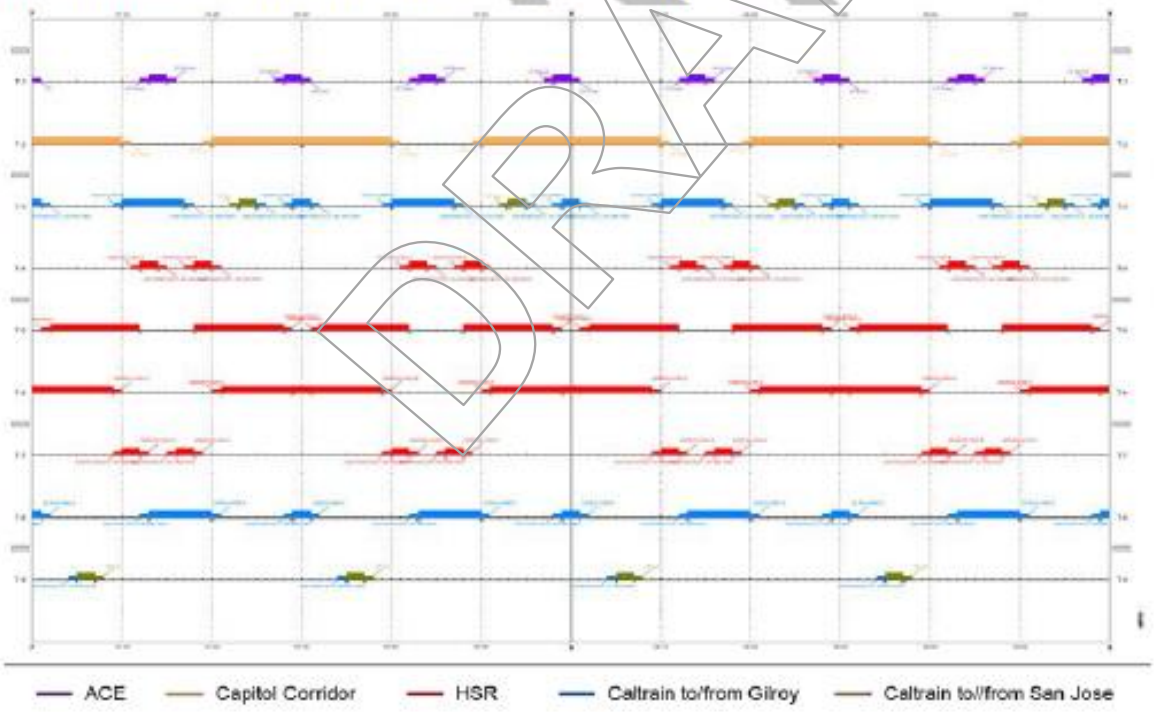
DRAFT

San Jose Diridon Station – platform arrangements

The illustrative schedule that has been developed can be accommodated in the existing layout at San Jose Diridon station together with the needs of Caltrain's tenants. Platform allocations are:

Platform	Track(s)	Platform height	Service(s)
1	1	Low level	ACE and UPRR
2	2	Low level	Capitol Corridor
	3	Low level	Caltrain northbound
3	4	High level	HSR northbound thru
	5	High level	HSR San Jose – LAUS
4	6	High level	HSR San Jose – LAUS
	7	High level	HSR southbound thru
5	8	Low level	Caltrain southbound
	9	Low level	Caltrain southbound

The diagram below shows station working in the peak hours 0700-0900:



DRAFT

Requirements and service plans, Phase 1, 2033

Operating parameters

Signal headways:	3 mins
Dwell times:	High-speed rail, 2 mins
	Caltrain, 1 min at major stations, 45 secs at minor stations
Train turnaround time:	20 mins for all operators
Trainsets:	High-speed rail, generic high-speed trainset
	Caltrain, Stadler KISS electric multiple units
Recovery time (pad):	10% distributed across the schedule

Infrastructure parameters

Tracks:	Two track railway with maximum available speed (MAS) up to 110mph[3]
Traction power:	Overhead 25kV catenary system
Passing locations (existing):	Bayshore, Lawrence
Passing locations (new):	Millbrae
High-speed stations:	San Francisco 4th and King[4] – 2 platforms, 4 tracks
	Millbrae – 1 platform, 2 tracks
	San Jose – 2 platforms, 4 tracks
	Gilroy - 2 platforms, 2 tracks

Peak[5] (off peak) operations

High-speed rail plans to operate:

- 4 (3) tphpd between San Francisco and southern California
  - all trains will call San Jose
  - 2 (2) tphpd will call at Millbrae
  - 1 (1) tphpd will call at Gilroy
- 3 (0) tphpd between San Jose and southern California
  - 1 (0) tphpd will call at Gilroy
- 1 (1) tphpd between San Jose and Merced, calling at Gilroy

[3] Note that from CP Coast to San Jose Diridon station two non-electrified tracks are required for UPRR, ACE and Capitol Corridor services

[4] Upon completion of the Downtown extension high-speed services will operate to/from the Salesforce Transit Center

[5] Peak hours are 0600-0900 and 1600-1900

California High Speed Rail Authority
San Jose to Merced Section: San Jose to Central Valley Wye

DESIGN CHECKLISTS
Draft PEPD
May 19, 2017

The discipline leads identified below attest that design for the Draft PEPD submittal for the San Jose to Central Valley Wye portion of the CAHSR San Jose to Merced Section has been performed in general compliance with the standards and guidance established in the attached Design Criteria Checklists, to the extent applicable to a 15% level of design.

Locations where compliance with standards has not been deemed feasible are documented in the Design Variance Log.

CAHSR JM
HORIZONTAL DESIGN CHECKLIST

DESIGN ELEMENT	CAHSR JM DEDICATED HST CRITERIA	HST REFERENCE	CALTRAIN (CHP 2)	UPRR (INDUSTRIAL TRACK CONSTRUCTION SPECS)
SPIRAL TYPE	**HALF-SINE SPIRALS** (variable rate transitions) shall be used on all tracks designed for: 1) Ballasted tracks: Curves having design maximum speeds of 80 mph or more 2) Non-ballasted tracks: Curves having design maximum speeds of 60 mph or more 3) Curves associated with turnouts having design maximum speeds of 110 mph or more **CLOTHOID SPIRALS** (constant rate transitions) shall be used on all lower speed tracks. Clothoid spirals may also be used on very large radius curves that require small amounts or no superelevation and have very small unbalanced superelevations	HST TM 2.1.2_6.1.5	The clothoid spiral is commonly used in most CADD design software. Since Caltrain adopted AutoCAD and its associated Civil Design Software in the design of track alignment, the clothoid spiral shall be used. Spirals are not required for curves less than 30 minutes for MAS under 20 MPH or on curve that is part of a turnout, however, a minimum of curve length of 100 feet shall be implemented. Additionally, all curves including such curves shall have a minimum 1/2 inch actual superelevation.	N/A
SPIRAL LENGTH	Spiral Lengths: The length of the spiral shall be the longest length determined by calculating the various length requirements, which are: - Length needed to achieve Attenuation Time - Length determined by allowed rate of change in superelevation - Length determined by allowed rate of change in unbalanced superelevation - Length determined by limitation on twisting over vehicle and truck spacing length **Half-Sine (Variable Change) Spirals *** Spiral Design Factor / Desirable / Minimum / Exceptional Superelevation: 1.63 Ea V / 1.30 Ea V / 1.09 Ea V Unbalance: 2.10 Eu V / 1.57 Eu V / 1.26 Eu V Twist **: 140 Ea / 118 Ea / 98 Ea Minimum Segment: 2.64 V / 2.20 V / 1.47 V **Clothoid (Linear Change) Spirals** Spiral Design Factor / Desirable (0.03 g) / Minimum (0.04 g) / Exceptional (0.05 g) Superelevation: 1.47 Ea V / 1.17 Ea V / 0.98 Ea V Unbalance: 1.63 Eu V / 1.22 Eu V / 0.98 Eu V Twist: 90 Ea / 75 Ea / 62 Ea Minimum Segment: 2.64 V / 2.20 V / 1.47 V The length is given in feet with: - Ea = Actual elevation in inches - Eu = Unbalanced elevation in inches - V = maximum speed of the train in mph * Longer lengths of half-sine spirals are due to the variability in the ramp rate. ** Provides maximum twist rates identical to clothoids. As a practical matter, this limitation never governs due to use of this type spiral only on high-speed tracks.	TM 2.1.2_6.1.5.3 (Table 6.1.7)	The superelevation differential between rail car truck centers should not exceed one (1) inch. The minimum length of spiral between compound curves shall be 62 feet. **Spiral Length Requirements** Based on sections AREMA Chapter 5, Section 3.1, the length of spiral shall be longest as determined from formulas: 1. $L_s = 1.63E_aV$; or $L_s = 1.22E_uV$ * **Desirable** 2. $L_s = 1.2E_aV$ **Minimum (upto 60 mph)** 3. $L_s = 62E_a$ **Absolute Minimum (or Exception) upto 50 mph** * *Use of Spiral length $L_s = 1.22E_uV$ requires the approval of Caltrain Deputy Director of Engineering* where, E_a = actual superelevation that is applied to the curve E_u = unbalanced superelevation (amount of superelevation not applied to the curve) V = design speed, MPH The spiral length shall generally be rounded to the nearest 5 feet.	N/A
SPIRALS ON LARGE RADIUS CURVES	Clothoid spirals may be used instead of half-sine spirals regardless of track type or design speed if the following conditions are met: The required superelevation and unbalanced superelevation are both under 1.0 inches at the maximum design speed; and the "Minimum Segment" length for the spiral is more than twice the length required by any other factor. Spirals may be omitted if the following conditions are met: The required superelevation is zero (balancing superelevation for the maximum speed less than 0.75 inches); and the calculated offset of the curve due to application of the spiral is less than 0.05 feet in ballasted track or less than 0.02 feet in non-ballasted track. (These values are subject to revision.)	HST TM 2.1.2_6.1.5.4	SEE SD-2101 Track Geometry - Curve Marking Details	N/A
REVERSE CURVES	If there is insufficient distance between curves to provide the minimum required length tangent segment, the spirals shall be extended to provide a reversing curve. If beneficial to design and construction, a straight distance between curves that would be run in less than 0.2 seconds at the normal operating speed may be left between spiral ends.	HST TM 2.1.2_6.1.5.4	SEE SD-2102 Track Geometry - Reversing curves Layout and Calculations	N/A
COMPOUND CIRCULAR CURVES	If there is insufficient distance between curves to provide the minimum required length tangent segment, the spirals shall be extended to provide a reversing curve. If beneficial to design and construction, a straight distance between curves that would be run in less than 0.2 seconds at the normal operating speed may be left between spiral ends.	HST TM 2.1.2_6.1.5.4	The minimum length of spiral between compound curves shall be 62 feet	N/A
CLEARANCE	See Typical Section design checlist		See CPUC requirements	See CPUC requirements

CAHSR JM
VERTICAL DESIGN CHECKLIST

DESIGN ELEMENT	CAHSR JM DEDICATED HST CRITERIA	HST REFERENCE	CALTRAIN (CHP 2)	UPRR (INDUSTRIAL TRACK CONSTRUCTION SPECS)
MINIMUM SEGMENT LENGTH	Attenuation time, based on the most conservative requirements, shall be: For V < 186 MPH, o Desirable attenuation time: not less than 2.4 seconds o Minimum attenuation time: not less than 1.8 seconds o Exceptional attenuation time: not less than 1.5 seconds. o An attenuation time of 1.0 seconds on the diverging route in curves adjacent to or between turnouts For V >= 186 mph o Desirable attenuation time: not less than 3.1 seconds o Minimum attenuation time: not less than 2.4 seconds o Exceptional attenuation time: not less than 1.8 seconds. Where alignment segments overlap, each change shall be treated as a separate alignment element for the purpose of calculating minimum segment lengths. Minimum segment length is calculated by the formula: Lfeet = Vmph x 44/30 x tsec.	HST TM 2.1.2_6.1.1	For mainline track, the desired length of constant profile grade between vertical curves shall be determined by the following formula (but not less than 100 feet): L = 3V where, L = minimum tangent length, feet V = design speed in the area, mph	Minimum length of 100 feet and be designed for the longest curve practical, with a V/L not to exceed 1.2 for Sags and 2.00 for ummits, in which V = (Grade 1) minus (Grade 2) and L = Length of Curve in Stations. Rate of change V/L = Algebraic difference in grades divided by the length of the vertical curve in 100 foot stations
CHANGES IN DIRECTION	Over four changes in direction per mile shall constitute an Exceptional condition.	HST TM 2.1.2_6.1	N/A	The track should be designed to minimize the number of grade changes and use the smallest V/L as practical (See Union Pacific (UP) Standard Drawing No. 0016)
MAXIMUM GRADE LIMITS	Maximum Grade Limits: - Desirable grades: as low as reasonably practical, with a limit of 1.25% - Maximum grades: above 1.25% and shall be as low as practical up to 2.50% - Exceptional grades: above 2.50% and shall be as low as practical up to 3.50% Minimum Grades: Without a separate drainage system, grades in cuts or tunnels (included cut and-cover) shall not be less than 0.25%.	HST TM 2.1.2_6.1.6.1	The maximum continuous main line grade along the Caltrain commuter corridor is one (1)%. The preferred maximum design gradient for long continuous grade shall be one (1)%. Maximum design gradient, with curve compensation at 0.04 percent per degree of curve if applicable, for grades up to two (2)% may be implemented for new construction projects with the approval of the Caltrain Deputy Director of Engineering. The resulting maximum gradient Gc is generally expressed as follows: Gc = G – 0.04D Where G is the Gradient before, and D is the degree of curve, in decimal.	Shall be designed for the least grade practical, but shall not exceed 2.00%. Grades on track at location used for spotting rail cars are not to exceed 0.4%. Vertical curves must not begin on the long ties of a turnout. The grade from the point of switch through the long switch ties must be the same as the existing track that the turnout is coming out of.
LENGTH OF STEEP GRADES	Where terrain permits, long grades steeper than the following shall not be used due to limits of breaking capability of some of the proposed train sets: - The average grade for any 3.7 mi long section of the line shall be under 3.5% - The average grade for any 6.2 mi long section of the line shall be under 2.5%	HST TM 2.1.2_6.1.6.1	N/A	N/A
LIMITATIONS OF SPEED ON GRADES	In European practice, speed on downgrades is constrained by train set braking limitations. The restriction is based on the average grade over any continuous length of 17,100ft along the line. The following speed limits for different grades are as determined in accordance with French standards: - Grade between 3.0% and 3.5%: Vmax = 143 mph - Grade between 2.2% and 3.0%: Vmax = 168 mph - Grade between 1.6% and 2.2%: Vmax = 186 mph - Grade between 0.0% and 1.6%: Vmax = 217 mph	HST TM 2.1.2_6.1.6.1	N/A	N/A
VERTICAL CURVES	The radius of the curve at the crest or sag is determined in accordance with the vertical acceleration permitted for passenger comfort and the maximum speed of the line. The formula in US Customary units would be: Rmin >= (V*44/30)2 / av, where R is in feet, V in mph, Vertical acceleration (av) in feet/sec2 and the 44/30 is necessary for the mph to ft/sec conversion. Vertical Curve Type Shall be Parabolic	HST TM 2.1.2_6.1.6.2	Vertical curves shall be designed per the requirements for high-speed main tracks and shooflies as recommended in AREMA	N/A
VERTICAL CURVES ACCELERATION RATES	The acceleration values to be used for vertical curves shall be: - Desirable: 0.60 ft/sec/sec (1.86 percent of gravity) – AREMA recommended practice for passenger railroads. - Minimum: 0.90 ft/sec/sec (2.80 percent of gravity) - Exceptional: 1.40 ft/sec/sec (4.35 percent of gravity)	HST TM 2.1.2_6.1.6.2	Passenger Train 0.60 (0.02 g) Freight Train 0.10	N/A
VERTICAL CURVE LENGTH	Vertical curve lengths on lines carrying high-speed trains only shall be: - Desirable VC Length: The longer of LVCfeet = 4.55 V (for 3.1 seconds) or LVCfeet = 2.15 V2 (Δ% / 100) / 0.60 ft/sec2, but not less than 400 Δ% - Minimum VC Length: The longer of LVCfeet = 3.52 V (for 2.4 seconds) or LVCfeet = 2.15 V2 (Δ % / 100) / 0.80 ft/ sec2, but not less than 200 Δ% - Exceptional VC Length: The longer of LVCfeet = 2.64 V (for 1.8 seconds) or LVCfeet = 2.15 V2 (Δ % / 100) / 1.20 ft/ sec2, but not less than 100 Δ% - The speed used in the preceding formulae shall be no less than 250 mph, except where other alignment factors such as speed limiting curves exist. In those locations, a lower speed equal to or higher than the maximum anticipated achievable train speed may be used to calculate the required vertical curve lengths. At 250 mph, these formulae give: o Desirable VC Length: LVCfeet = 2250 Δ% o Minimum VC Length: LVCfeet = 1500 Δ% o Exceptional VC Length: LVCfeet = 970 Δ% The 2.15 factor is a constant necessary to unit conversions within the US Customary measuring system.	HST TM 2.1.2_6.1.6.2	L = (D V²K) /A where, A = vertical acceleration, in ft/sec² D = absolute value of the difference in rates of grades expressed in decimal K = 2.15 conversion factor to give L, in feet L = length of vertical curve, in feet V = speed of train, in miles per hour Under no circumstances shall the length of vertical curve be less than 100 feet.	N/A
VERTICAL CURVE AND HORIZONTAL SPIRAL CLEARANCE	Due to potential maintenance difficulties, it is desirable to avoid use of vertical curves in spirals. The desirable distance between end of spiral and beginning of vertical curve or end of vertical curve and beginning of spiral is 160 feet with a minimum limit of 100 feet. Overlap between vertical curves and spirals may be permitted as an Exceptional condition, but only where it can be shown that practical alternatives have been exhausted.	HST TM 2.1.2_6.1.7	N/A	N/A
CLEARANCE	See Typical Section design checklist		N/A	Top of Rail to Existing track - minimum of 200 feet in prior to the proposed point of switch and 200 feet from the last long switch tie. The minimum clearance shall be 23 feet from top of rail to nearest overhead obstruction (See UP Standard Drawing No. 0038 & 0035).

CAHSR JM
TURNOUT AND STATION TRACKS DESIGN CHECKLIST

DESIGN ELEMENT	CAHSR JM DEDICATED HST CRITERIA	HST REFERENCE	CALTRAIN (CHP 2)	UPRR (INDUSTRIAL TRACK CONSTRUCTION SPECS)
GENERAL	Use curved frogs. The high-speed turnouts will normally be built on some form of concrete based track, not on ties and ballast.	HST TM 2.1.3_6.1	a. Lateral turnouts numbers 8 and 9 for yards b. Lateral turnouts number 10, 14, and 20 for main line. Number 20 sha l be used where there are no real estate constraints. c. Number 9 double slip sw tches may be used in terminals. d. Turnouts w th Hollow Steel Ties (HST) per Standard Drawings SD-2000 series shall be used for new constructions. SEE DWG SD-2401-2901	n/a
SUPERELEVATION	Unbalanced Superelevation not to exceed 3 inches Superelevation in curve off of a turnout ≤ 1.25"	HST TM 2.1.3_6.1	N/A	N/A
MINIMUM TIME	Minimum time over any turnout segment or curve connected to a turnout, including spirals on the frog end of turnouts and spirals into a curve on the diverging track that is adjacent to the turnout 1 sec	HST TM 2.1.3_6.1	N/A	N/A
MAXIMUM VIRTUAL TRANSITION RATE AT SWITCH POINT	5.0 inches/second	HST TM 2.1.3_6.1	N/A	N/A
KEEP SPIRALS OUT OF FROGS	Minimum/Exceptional In order to avoid a special design swing nose frog, the frog end spiral shall begin at or beyond the point where track centerline spacing exceeds 5.85 feet, even if this means that the transition length in a crossover will have a run time of less than 1.0 seconds. Desirable Start frog end spiral beyond the point where the track centerline spacing exceeds 7.00 feet, if spiral is to a tangent or followed by a reversing curve. If the spiral is to a compound curve, it shall start beyond the point where the track center ine spacing exceeds 8.00 feet.	HST TM 2.1.3_6.1		
HIGH SPEED TURNOUTS GEOMETRY	See Table 6.1.1	HST TM 2.1.3_6.1.1	N/A	N/A
CROSSOVER BETWEEN MAIN TRACKS	See Table 6.1.2 for 16.50 feet track centers. Use of highspeed crossovers in tracks with centers of under 16.50 feet shall be an Exceptional condition.	HST TM 2.1.3_6.1.2		
STATION CONNECTION TRACKS WITH SPIRAL POINT TURNOUTS	See Table 6.1.3 for 25 feet track centers	HST TM 2.1.3_6.1.3	N/A	N/A
LOW AND MEDIAN SPEED TURNOUTS GEOMETRY	See Table 6.1.4	HST TM 2.1.3_6.1.4	Turnouts and crossovers shall be located on tangent tracks and shall meet the following requirements a. 100 feet minimum from point of switch (PS) to horizontal or vertical curves b. Less than 100 feet from horizontal curves without superelevation with approval from the Ca train Deputy Director of Engineering. c. 100 feet minimum from point of switch to the edge of road crossings (including sidewalks) d. 50 feet minimum from PS to Insulated Joint e. 50 feet minimum from PS to opposing point of switch f. Crossovers sha l be located in parallel tracks only g. Standard crossovers shall be of 15 feet track center SEE SD-2103 TRACK TURNOUTS AND DERAILS - STANDARD TURNOUT AND CROSSOVER DATA	Show a l existing turnouts (within 1500' of the limits of the construction area) and proposed turnouts, including size (No. 11, No. 15, etc). Show the Engineering Station (ES) of each point of switch. **UP Standard Drawing No. 345000 345003** - No. 15 turnouts will be required for all unit train operations and at other locations required by the UP. Installation may or may not require power operation. Main line turnouts are to be made of 136# rail unless specified and/or approved by UP's AVP Engineering – Design/Construction or a designated representative. **UP Standard Drawing 343000 343003**- No. 11 turnouts (minimum) are required out of all main tracks and located not closer than 300 ft. to a main line curve or bridge. Main line turnouts are to be made of 136# rail unless specified and/or approved by UP's AVP Engineering – Design/Construction or a designated representative **UP Standard Drawing 341000 341003** - No. 9 turnouts are recommended for industrial lead and spur track installation other than main track. Turnouts maintained by UP are to be 136# rail unless specified and/or approved by UP's AVP Engineering – Design/Construction or a designated representative. No. 7, No. 8, No. 8-1/2 or No. 10 turnouts will be considered where site conditions warrant in lieu of No. 9 turnouts on privately owned and maintained trackage, they must meet the latest edition of the AREMA Manual. UP w ll not own or maintain turnouts of these sizes.
	a. Reduce size of Turnouts from 110 mph to 60 mph. b. Reducing the speed of the station turnouts is in conjunctic;m w th the recommendation to reduce the speed of the universal crossovers and increase their spacing. c. The station platform track between entry turnout and the exit turnout along the main track shall have a 3,350 foot minimum length centered symmetrically on the midpoint of the station platform.	HST NTD 13		
STORAGE AND REFUGE TRACKS AT HIGH SPEED STATIONS	Turnouts smaller than the number 11 shall not be used. See Table 6.1.5 for 22 feet track offset the turnout - return curve selections.	HST TM 2.1.3_6.1.5	N/A	N/A
	Modify refuge track or storage track length from 1650' to 900' clear length	HST NTD 13	N/A	N/A
Spacing Between Facing Adjacent Points of Switch on Main Tracks	The distance between two facing points of switch of adjacent crossovers and the distance between the point of switch of a turnout facing an adjacent point of switch of a crossover shall adhere to the following spacing requirements • Desirable distance between two high-speed (60 mph or faster) points of switch 1400' • Minimum distance between two high-speed (60 mph or faster) points of switch 1000' • Desirable distance between two low-speed (55 mph or slower) points of switch 600' • Minimum distance between two low-speed (55 mph or slower) points of switch 400' • Desirable distance between high-speed and low-speed points of switch 1000' • Minimum distance between high-speed and low-speed points of switch 700'	HST NTD 10R1	N/A	For the minimum distance between facing point turnouts use UP Standard Drawing No. 0017 for guidance
Crossover Spacing	a. Increase nominal spacing of the interlockings from 20 miles to 40 miles throughout the program. b. Change universal interlocking from 110 mph to 80 mph.	HST NTD 10R1	Maximum authorized speeds (MAS) through turnouts and crossover for passenger and freight trains are as fo lows a. 10/10 MPH for turnouts number 9 for both passenger and freight b. 25/15 (passenger/freight) MPH for turnout number 10 c. 35/25 (passenger/freight) MPH for turnout number 14 d. 50/40 (passenger/freight) MPH for turnout number 20	N/A

CAHSR JM
ROLLING STOCK AND VEHICLE INTRUSION PROTECTION FROM ADJACENT TRANSPORTATION SYSTEMS DESIGN CHECKLIST

DESIGN ELEMENT	CAHSR JM DEDICATED HST CRITERIA	REFERENCE
SEPARATION DISTANCE FROM ADJACENT RAILROAD SYSTEMS	1. No intrusion protection is required for tracks with centerlines separated horizontally by 102 feet or greater. 2. No intrusion protection is required where the closest HST track elevation is 10 feet or higher than the rail elevation of the closest conventional track. This can be accomplished when the HST is on aerial structure, on an embankment or on a retained fill. However, protective structures may be required for piers, abutments or retaining walls if the side clearance is less than 25 feet. 3. Where intrusion protection is required, the minimum total height shall be 10 feet and may be comprised of a ditch and berm, concrete wall plus screen, or only concrete wall. 4. Use of only berms or ditches as intrusion protection requires centerline separation of 76 feet or more where half of the berm is in the HST right-of-way and the other half in adjacent railroad right-of-way, as shown on drawing TM 2.1.7-A, and 85 feet or greater where the entire berm is in HST right-of-way or 76 feet or more where the entire ditch is within HST right-of-way, as shown on drawing TM 2.1.7- E in Appendix A. 5. A physical intrusion barrier/crash wall is required when the separation between centerlines of the nearest HST and adjacent conventional railroad track is less than 76 feet, as shown on drawing TM 2.1.7-D in Appendix A. The minimum separation between the closest conventional railroad track centerline and HST track centerline is 50 feet (37 feet with railroad approval) for at grade section and 27.5 feet on a common aerial structure as shown on drawing TM 2.1.7-B. These guidelines consider physical separation and do not include right-of-way considerations, which may introduce additional separation requirements. Additionally, separation requirements of other owners and operators must be considered in establishing separation requirements.	HST TM 2.1.7_6.1.4
MINIMUM OFFSET BETWEEN PIER FOR GRADE SEPERATION PROJECTS AND THE CLOSEST TRACK	25 FEET	HST TM 2.1.7_6.1.5

CAHSR JM TEMPORARY CONSTRUCTION FACILITIES DESIGN CHECKLIST

The High Speed Rail Authority has no geometric design criteria for temporary construction facilities. Such facilities can be highly variable in extent and location, and are subject to site selection that depends on such factors as expected construction methods, distance to suppliers and material, access and egress to working areas, and many more. Moreover, although these facilities can be described and even acquired by the project owner in anticipation of construction, the means and methods of construction rely largely on the construction contractor's preferences. This being the case, imposition of rigid geometric criteria for temporary facilities would ignore many important factors and hold a contractor to rigid constraints that could adversely affect the efficiency and expense of the work.

Therefore, a design checklist would not be generated.

	Pick-Up and Drop-Off Facilities	HST TM 2.2.3, 6.2.4	HST TM 2 2.3, 6.2.4	
	Automobile Parking	Max. distance from parking to station entrance = 1500' or a 5 to 7 minute walk. Provide ADA, carsharing, carpool/vanpool, and staff parking spaces.	HST TM 2 2.3, 6.2 5	
	Roadways and Vehicle Access and Circulation	Single lane driveway: min. 11 5' wide. Min. 10' wide driveway for multiple lanes.	HST TM 2 2.3, 6.2 6	
	Additional Site Layout Considerations	HST TM 2.2.3, 6.3.8	HST TM 2 2.3, 6.3 8	
STATION PLATFORM GEOMETRIC DESIGN	Platform Configuration	HST TM 2.2.4, 6.1.1	HST TM 2 2.4, 6.1.1	
	Usable Platform Length	800'. Not applicable for joint facility stations (e.g. 4th and King or LAUS) where the platform length should be the same as the other rail operators in the facility, but not shorter than 800 ft.	HST NTD 13	
	Platform Width	Center Platform: 30' Min.; 25' Exceptional. Side Platform: 20' Min.; 18' Exceptional	HST TM 2 2.4, 6.1 3	
	Platform Cross Slope	1% Min.; 2.1% Max.	HST TM 2 2.4, 6.1.4	
	Platform Longitudinal Slope	0% Desirable; 0 25% Max.	HST TM 2 2.4, 6.1 5	
	Platform Curvature	Largest radius possible, platform edge be convex, subject to variance process.	HST TM 2 2.4, 6.1 6	
	Platform Height Above Rail	45.47" to 51.18" above top of rail.	HST TM 2 2.4, 6.1.7	
	Track Centerline to Platform Dimension	1/2 width of vehicle + 2.75" (or 5'-9" nominal for preliminary design.)	HST TM 2 2.4, 6.1 8	
	Platform Edge to Train Gap	Horizontal Gap: 3" Max.; Vertical Gap +/- 5/8" Max.	HST TM 2 2.4, 6.1 9	
	Setback of Obstruction from Edge of Platform	6.5' min. setback for small obstruction less than 3.3' in length parallel to platform. 8.25' min. setback for obstruction greater than 3.3' in length parallel to platform	HST TM 2 2.4, 6.1.10	
	Under Platform Refuge Area	30" x 30" min. entire length of platform. Exits from this space shall be provided at platform ends.	HST TM 2 2.4, 6.1.11	
	Platforms Adjacent to Through Tracks	Train speed on tracks adjacent to station platforms not to exceed 125 mph. Through train operating on track adjacent to platform should have one or more following provisions: 1) Passenger access to platform shall only be permitted when train is intended to stop, 2)Provide platform doors/barriers as access control to train, 3) Provide audible and visual warning on platform to provide advance notice of approaching trains.	HST TM 2 2.4, 6.1.12	
	Protection Screen between Station platform & Through Tracks	Provide 25' between track centers to allow for installation of protection screens, if required.	HST TM 2 2.4, 6.1.13	
	OCS Poles on Platforms	To meet National Electrical Safety Code (NESC) requirements. Grounding and Bonding and Protection required per TM 3.2.6.	HST TM 2 2.4, 6.1.14	

CAHSR JM
BRIDGES AND ELEVATED STRUCTURE DESIGN CHECKLIST

DESIGN ELEMENT		HST TM	Caltrain Standards for Design and Maintenance of Structures	BNSF/UPRR Guidelines 1. UPRR - BNSF Railway Guidelines for Railroad Grade Separation Projects (Dated 01/05/2016)	AREMA	CAHSR JM CRITERIA
Superstructure	**General Span/Structure Type**	Proposed basic aerial structure is a prestressed concrete single cell box girder, spanning approximately 100 to 130 feet and supporting two parallel tracks. Simply supported spans. (TM 2.3.3)	Simple span structures are preferred over a continuous span type of superstructure for use along the corridor (2-2). Deck type structures are preferred over hrough type structures. (2-2)	Only simple spans with ballast decks are allowed. Cast-in-place concrete superstructures are unacceptable. (6.1)[1]		Proposed basic aerial structure is a prestressed concrete single cell box girder, spanning approximately 100 to 130 feet and supporting two parallel tracks. Simply supported spans. (TM 2.3.3)
	Structure Type	Prestressed concrete single cell box girder, spanning approximately 100 to 130 feet.	1. Steel rolled beams (4 or more per track) 2. Steel plate girders (4 or more per track) 3. Prestressed concrete box girders or solid slab girders (no voids) 4. Steel rolled beams (2 per track) 5. Prestressed concrete "AASHTO" type girders 6. CIP/RC box girder 7. PT box girder 8. Through type steel structures.	Cast-in-place concrete superstructures are unacceptable. (6.1)[1] 1. Steel rolled beams + steel plate deck (5 or more per track) 2. Steel plate girders + steel plate deck (4 or more per track) 3. Steel rolled beams + concrete deck (5 or more per track) 4. Steel plate girders + concrete deck (4 or more per track) 5. Railroad Standard Prestressed Double Cell Box Beams 6. Prestressed Concrete Box Beams 7. Prestressed Precast Concrete AASHTO Type Beams 8. Through type steel structures. (6.8.1)[1]		Prestressed concrete single cell box girder, spanning approximately 100 to 130 feet.
Substructure	**Type**	10'x6' elliptical single column supports (TM 2.3.3) Substructure to satisfy requirements of TM 2.3.3, Section 6.1 5.	Piers with two columns or solid pier wall are preferred over single column piers. (2.6.1)	Piers with a minimum of two columns shall be provided. A solid pier wall with a minimum of 4'-0" thickness is preferable. Single column piers shall not be considered for Underpass Structures. (6.9.1)[1]		10'x6' elliptical single column supports (TM 2.3.3)
	Skew	---	30 degree maximum, at abutment must be squared off support perpendicular to track (Figure 2-2, page 2-7)	15 degree maximum for concrete structures and 30 degrees max for a steel structure (6.3)[1]	15 degree maximum for precast concrete slabs and box girders, 30 degree maximum for precast concrete I-girder and T-girder, 60 degree maximum for CIP concrete slabs and girders. (8-2.1.6)	
Clearance	**Vertical Permanent Overhead**	27'-0" for new structures (TM 1.1.21) 24'-6" for shared use track (TM 1.1.21)	24'-6" Min. 25'-6" Preferred 23'-6" Absolute Min. (Fig 3.1)	23'-4" minimum within 25'-0" of centerline track (Plan 711100)[1]	23'-0" (Figure 28-1-6)	27'-0" for new structures (TM 1.1.21) 24'-6" for shared use track (TM 1.1.21)
	Vertical Permanent Underpass	16'-6" Freeway / Expressway (TM 1.1.21) Varies / Others (TM 1.1.21)	16'-6" over Freeways and Expressways (2.4 2) 15'-6" over highways and local streets (2.4.2) (Collision protection device required) (Page 2-14)	16'-6" for steel superstructure with 5 or more beams or 4 or more deck plate girders per track 17'-6" for concrete superstructure or steel through plate girders with bolted bottom flanges 20'-0" for steel through plate girders without bolted bottom flanges (6.6.1)[1]		16'-6" Freeway / Expressway (TM 1.1.21) Varies / Others (TM 1.1.21)
	Vertical Temporary	---	21'-6". CPUC approval required for vertical clearance less than 22'-6" (Fig 3.1)	21'-0"		
	Horizontal Permanent Overhead	25' preferred, 12' minimum from CL exterior track to face of column, protection required < 25'-0" (TM 1.1.21)	25' preferred, 15' minimum from CL exterior track to face of column (Fig 3.1)	25'-0" minimum (Plan 711100)[1] Piers within 25'-0" shall be protected. Absolute minimum shall be 18'-0" from centerline track to pier protection wall (5 2.2)[1]	25'-0", less than 25'-0" requires crash walls (Figure 28-1-6) Tangent track, 9'-0" minimum (Figure 28-1-1)	25' preferred, 12' minimum from CL exterior track to face of column, protection required < 25'-0" (TM 1.1.21)
	Horizontal Temporary	---	10'-0" (Note 5, Fig 3.1)	12' for UP (4.4.1)[1]		
Rail	**Ballast Depth**	24" minimum top of tie to deck (Directive Drawing)	8" of ballast over 4" HMAC on structure or 12" HMAC on approach (Fig 2.7)			
Serviceability	**Span to Depth Minimum**	Span Length / 10 (TM 2.3.3)	Span Length / 12.5 (Steel Beam Span, Concrete Box Girder Span, Precast Concrete Beams) (Figure 2.7, 2.8, 2.10, 2.11) Span Length / 10 (Steel Deck Plate Girder Span) (Figure 2.9)			Span Length / 10 (TM 2.3.3)
Loading	**Ballast**	24" minimum top of tie to deck (Directive Drawing)	Min. 12" / Max. 30" (Fig 2.8)	Up to 30" (6.1.1)[1]		
	Live Load	E-50 (TM 2.3.2)	E-80 (2.3.3)	per AREMA (6.1.1)[1]	E-80 (8-2.2 3)	E-80 (2-8)
	Track Placement	Assume that the track locations are fixed transversely.	Tracks can be placed anywhere on deck to maximize load.			Assume that the track locations are fixed transversely.
Construction	**Excavation adjacent to tracks**	N/A	8'-6" minimum from centerline of track unless approved by Chief Engineer (Appendix B)	Excavation not permitted within 12'-0" of track centerline. (Standard Plan 710000)

TUNNELS DESIGN CHECKLIST

DESIGN ELEMENT	CAHSR JM DEDICATED HST CRITERIA	REFERENCE
Tunnel Plan and Profile		
1	22 feet width for emergency access road is provided on either side of the tracks.	TM 2.8.1
Tunnel Cross Section		
1	Tunnel diameter is shown at 28ft inner diameter.	NTD. 10 R1
2	Cross passages are shown at every 800ft	TM 2.4.2 R1
3	Finished bored tunnel cross sectional area includes the following: - Free tunnel cross sectional area as required - 20 sf for fixed equipment - 6-inch allowance on diameter for construction tolerance - 3-foot depth of invert concrete - An escape walkway at track level (slightly raised above invert level)	TM 2.4.2 R1
Tunnel Portal		
1	The tunnel portal is located where a minimum ground cover of half tunnel diameter can be provided over both tunnels, unless otherwise indicated.	TM 2.4.5 R0
Cut Slopes and Embankments (Pacheco Pass Subsection)		
1	For cut slopes, the slope angle shown in 3H:1V, unless otherwise specified.	TM 2.6.7
2	For embankments, the slope angle is assumed to be 2H:1V, unless otherwise specified.	TM 2.6.7
3	Slope benches are provided at every 30 feet for cut slopes and embankments higher than 30 feet.	DC 10.9.4, TM 2.6.7
4	Slope benches of at least 10 feet wide are provided for cut slopes and embankments higher than 30 feet.	DC 10.9.4, TM 2.6.7
Tunnel Portal Facilities		
1	Space is allocated for the following facilities at each tunnel portal unless otherwise indicated: - Detention pond - TPF site (2 options) - Rescue area (5000 sq. ft) - Train evacuation zone (1400') - Maintenance parking - 22' width maintenance access road - Radio tower site (100' x 100') - Water tanks (100' x 100')	Directive drawing: DD-TN-400 and discussions with RDP
2	Area of approximately 7500 sf is allocated for portal ventilation buildings	TM 2.4.6 R0

CAHSR JM
GRADING DESIGN CHECKLIST

DESIGN ELEMENT	CAHSR JM DEDICATED HST CRITERIA		REFERENCE	COMMENTS
Slope Angles	Normally Adopted	1.5H:1V or 2H:1V	HST TM 2.6.7	
	In case of coarse rock fill, benches, toe walls	1H:1V or 1.25H:1V		
	For slopes supported by compressible soft foundation soils	required slope stability analyses		
	For 15% Design Level: Soil Cuts	2H:1V		
	For 15% Design Level: Rock Cuts	1H:1V		
	Granular Soils	1.5H:1V to 2H:1V according to the height of the cut		
	Cohesive Soils	1.5H:1V to 2H:1V according to the height of the cut, or even flatter, with benches if required		
	Pre-historic landslide areas	required slope stability analyses		
Specific Consideration for Maintenance According to the Structure Height	Cuts with depth greater than 40' or Embankment over 40' height	6 feet wide bench with a 6% gradient toward the toe of the slope/the high-side line	HST TM 2.6.7	
		Place bench every 30 feet in height (allowance from 26 to 32 feet can be considered)		
		The bench shall be connected to the natural ground at each end of the cut/ground for access.

Design Discharge	Refer to Caltrans HDM, Topic 819	Max expected discharge from drainage tributary area shall be computed by using the Rational Method Facilities owned and/or maintained by the Local Agency, the design discharge shall be computed using other applicable procedures as required and approved by the Local Agency Precipitation, intensity, and duration data shall be based on the data either from San Francisco, San Mateo, or Santa Clara counties depending on where the project is located	Refer to Caltrans HDM, Topic 819, Table 819 5A Summary of Methods for Estimating Design Discharge Empirical methods have been used in hydrology, including: Rational methods, Regional Analysis Methods, Flood Frequency Analysis, National Resources Conservation Service (NRCS) Methods, Statistical Methods, Hydrograph Methods	Not Defined	Refer to Caltrans HDM, Topic 819
Floodplain Information	FEMA provides floodplain maps with flood zones identified improvements cannot be higher than the 100-year BFE Refer to Caltrans HDM, Topic 804, Floodplain Encroachments, for FEMA guidelines	Not Defined	23CFR, Section 650.115 Identify flood hazards Water surface elevation for the 100-yr flood Provide floodway data	Not Defined	FEMA provides floodplain maps with flood zones identified improvements cannot be higher than the 100-year BFE Refer to Caltrans HDM, Topic 804, Floodplain Encroachments, for FEMA guidelines Consult with local flood control agency.
Application of Approved Software	Hydrologic/hydraulic - industry accepted design programs are recommended (see Caltrans HDM Topic 808.	Follow Caltrans HDM/Local Agency	Various H&H software including FHWA Hydraulic Toolbox, TR-55, HEC-HMS, HY-8, HEC-RAS, FESWMS, WMS, NOAA Atlas 14, USGS SteamStats, AutoDesk Civil 3D/Hydraflow	Not Defined	Hydrologic/hydraulic - industry accepted design programs are recommended (see Caltrans HDM Topic 808.
Culvert Design	Max allowable headwater of 1.5 times pipe diameter up 0.5 feet below sub-ballast. For 100-year storm event, min freeboard between water surface elevation and the subballast shall be 2 feet 36" Min. Dia RCP (Class V) within ROW Min. 6' below top of rail, and 3' below the flow line of ditch along the track way For pipes not under track use 4' of cover with 45' of the track centerline & 3' min elsewhere	Min. diameter 12" Pipes directly under the track or within 15' from centerline of the tracks: Caltrans Class V RCP required pipe size min. 24" diameter	Caltrans HDM, Topic 825 Min diameter for cross culverts under the roadways 18" Self-cleaning velocity, pipe sizes of 18" or more in diameter should be considered Pipe runs exceed 100' between inlet and outlet, or intermediate cleanout access, the min. diameter of pipe to be used is 24" Larger diameter pipe without the median access is preferred	n/a	Max allowable headwater of 1.5 times pipe diameter up 0.5 feet below sub-ballast. For 100-year storm event, min freeboard between water surface elevation and the subballast shall be 2 feet 36" Min. Dia RCP (Class V) within ROW Min. 6' below top of rail, and 3' below the flow line of ditch along the track way For pipes not under track use 4' of cover with 45' of the track centerline & 3' min elsewhere
Open Channel Design	Avoid critical and supercritical flow in trackside ditches Ditches should be deep enough and sized for handling the design runoff anticipated while allowing the subgrade to drain Required minimum freeboard, minimize erosion, maintain soil stability Refer AREMA Chapter 1, Part 1 for design adjacent to tracks. Also refer to Caltrans HDM Topic 860.	Not Defined	Caltrans HDM, Topic 860 The shape of a channel section is generally determined by considering the intended purposed, terrain, flow velocity and quantity of flow to be conveyed. Rectangular Channel Freeboard Height Subcritical Flow: 0.1He Supercritical Flow: 0 20d Trapezoidal Channel Freeboard Height Subcritical Flow: 0.2He Supercritical Flow: 0 25d	Not Defined	Avoid critical and supercritical flow in trackside ditches Ditches should be deep enough and sized for handling the design runoff anticipated while allowing the subgrade to drain Required minimum freeboard, minimize erosion, maintain soil stability Refer AREMA Chapter 1, Part 1 for design adjacent to tracks. Also refer to Caltrans HDM Topic 860.
Bridge/Aerial Structure Design	Freeboard above the design frequency water surface elevation min. 2' For ballasted bridge deck drains up to 500' Min. 6" pipe For ballasted bridge deck drains over 500' 8" pipe Longitudinal slope on bridge deck min. 0.5% Or generate minimum velocity 2 ft/sec No standing water on bridge HEC-21 Design of Bridge Drainage HDS-01 Hydraulic of Bridge Waterways AREMA Chapter 1, Part 3 HEC-09, Debris Control Structures Evaluations nd Countermeasures	Not Defined	Not Defined	Not Defined	Freeboard above the design frequency water surface elevation min. 2' For ballasted bridges lengths up to 500' Min. 6" pipe For ballasted bridges lengths over 500' 8" pipe Longitudinal slope on bridge deck min. 0.5% Or generate minimum velocity 2 ft/sec No standing water on bridge
Underdrain System	HDS-01 Hydraulics of Bridge Waterways AREMA Chapter 1, Part 3 HEC-09, Debris Control Structures Evaluations and Countermeasures Refer Caltrain Chapter 8.0 & Caltrans HDM	min. 6" in diameter at min. grade of 0.2% Cleanout Every 300' Manhole/inlet spacing 500' max (up to 30" diameter) 600' - 1000' (>30" diameter) Pipe cover below top of rail min. 48"	n/a for track	Not Defined	min 6" in diameter Cleanout installed every 300' pipe cover min. 48" below top of rail for all pipes Refer to Caltrain Chapter 8 0 & Caltrans HDM
Roadway Drainage	Refer Caltrans HDM, Topic 830	Not Defined	Min pipe diameter for storm drain systems Trunk drain 18" Trunk Laterals 15" Inlet Laterals 15"	Not Defined	Refer Caltrans HDM, Topic 830

UTILITIES DESIGN CHECKLIST

DEDICATED HST CRITERIA | COMMON CRITERIA | DEDICATED CALTRAIN CRITERIA | DEDICATED UPRR CRITERIA

DESIGN ELEMENT	HST TM 2.7.4	CALTRAIN DESIGN STANDARD (CHPATER 8)	CALIFORNIA PUBLIC UTILITIES COMMISSION	UP Wireline/Pipeline Encroachment Planning Guide & Construction Procedures	DEDICATED HST CRITERIA	DEDICATED CALTRAIN CRITERIA	DEDICATED UPRR CRITERIA	COMMENTS
Underground Utilities	Underground facilities located within the right of way must be located in a steel casing pipe (3/8" minimum thickness) with welded joints. Exception: For electrical and communication lines, a duct bank can be used in lieu of steel casing pipe. Where a portion of the line crosses under the tracks or is located within 45 feet of the nearest track centerline, it must meet the requirements of Exhibit A. Underground Utilities High Risk facilities: • Maintain 500 feet minimum horizontal separation from other High Risk facilities • Maintain 5 feet minimum horizontal separation from other Low Risk facilities • Maintain 20 feet minimum horizontal separation from load carrying structural elements Underground Utilities Low Risk facilities: • Maintain 3 feet minimum horizontal separation from other Low Risk facilities • Maintain 5 feet minimum horizontal separation from load carrying structural elements and 3 feet minimum horizontal separation from other structures • Maintain 1 foot minimum vertical separation from drainage conduits	Utilities specifically designed for the Caltrain facilities at stations and right-of-way shall conform to the standards, codes, and requirements of the CPUC and the local jurisdiction within which the utilities are located, as appropriate. Third party utilities owners include private owners, state, and municipal government. Work shall be coordinated with and done in accordance with the standards of the utilities owner.	Clearance and Depth Requirements for Supply and Communication Systems: General Order No. 128 Appendix A. Table 1	If the proposed location of the encroachment crosses existing culverts, the top of the buried encroachment will have to be installed a minimum of 5' below the culvert invert. If the location crosses a ditch beyond the end of the culvert (field side) then the top of the buried encroachment must be installed 5' below the clean bottom elevation of the ditch. Track bores must be a minimum of 60 inches below base of rail. Wet bores are not permitted on Union Pacific property. The ends of steel casing (see Union Pacific Common Standard 1029) will have to be a minimum of 30 feet from centerline of the track when measured at right angle to the track. Also, bore pits must be a minimum of 30 feet from centerline of track when measured at right angle to the track. In addition, no bore pits can be located in the slope of a cut or fill section of the roadbed. The bore pit size must be kept to a minimum. Manholes must be capable of withstanding H-20 highway loading requirements and must be installed so as not to create a stumbling hazard.	Underground facilities located within the right of way must be located in a steel casing pipe (3/8" minimum thickness) with welded joints. CAHSR JM GEOTECHNICAL DESIGN CHECKLIST

Three Geotechnical Investigation Plans and one Geotechnical Data Report were prepared by ENGEO between March and Sept 2016. These reports do not contain recommendations nor design values. Therefore, a design checklist would not be generated.

CAHSR JM RIGHT OF WAY DESIGN CHECKLIST

The High Speed Rail Authority has not promulgated geometric criteria for Right of Way. Right of way limits, both permanent and temporary construction easements (TCEs), are designed taking a number of factors into account. Many of these are qualitative and have to do with the surroundings of the rail alignment. HSRA design guidance exists for typical cross-sections. The right of way width and TCE limits vary for different standard cross-sections. Right of way and TCE will also vary depending on surrounding topography and land features, development, environmental considerations, and a host of other non-quantifiable conditions. For these reasons, right of way and TCE are generally determined by the judgment of the engineers, which reflects railroad clearance and alignment requirements, but also the many other factors that do not lend themselves to strict quantification.

Therefore, a design checklist would not be generated.

CAHSR FJ
GENERAL DESIGN CHECKLIST

DESIGN ELEMENT	DEDICATED HST CRITERIA (HST TM 1.1.18)	DEDICATED CALTRAIN CRITERIA (CALTRAIN DESIGN STANDARD- Chapter 1)	DEDICATED UPRR CRITERIA
DESIGN VARIANCE PROCESS		Standard ('shall') means required, no exception. Guidance ('should') means recommended, involving engineering judgment. Option ('may') means permission. Support is informational statement. Any deviations from all these criteria shall receive prior aproval by The Caltrain Deputy Director of Engineering. It shall be noted that variances or deviations are not for convenience. They shall be very rare, and only as a last resource and only after exhaustive analysis. Designers or other Project personnel shall not request a variance based on precedence. To request a variance, designers shall prepare written justifications documenting the reasons and justifications. If approved, the variance is only valid for the specific location of the project. This variance can not be used for future variance request. Any design variances shall never be less than the regulatory standards, and shall not introduce unacceptable safety and functionality of the railroad.	N/A
DOCUMENT CONTROL	1) Design Variance Request Form 2) Required Data 3) Supporting Documentation	To request a variance, designers shall prepare written justifications documenting the reasons and justifications.	N/A

APPENDIX 2-E: PROJECT IMPACT AVOIDANCE AND MINIMIZATION FEATURES

APPENDIX 2-E: PROJECT IMPACT AVOIDANCE AND MINIMIZATION FEATURES

Since publication of the Draft Environmental Impact Report (EIR)/Environmental Impact Statement (EIS), the following substantive changes have been made to this appendix:

- Where appropriate, the verb "would," when used specifically to describe impact avoidance and minimization features (IAMF) or mitigation measures, as well as their directly related activities, was changed to "will," indicating their integration into project design.
- The IAMF to reduce emissions from on-road construction vehicles (AQ-IAMF#5) was clarified.
- The title of AQ-IAMF#4 was corrected.
- BIO-IAMF#12 was revised to include use of facility designs and architecture that minimizes the potential for bird collisions with buildings, to the extent feasible and consistent with local design requirements, and use of bird-friendly lighting on all stationary light sources (i.e., lighting with shorter wavelengths toward the blue and green spectrum), provided it is consistent with safety and security requirements. The Grasslands Ecological Area was added as a location where additional bird operational actions will be required.

Impact Avoidance and Minimization Features Definitions

The California High-Speed Rail Authority (Authority) and the Federal Railroad Administration (FRA) have pledged to integrate programmatic IAMFs consistent with the (1) *2005 Statewide Program Environmental Impact Report/ Environmental Impact Statement (EIR/EIS)*, (2) *2008 Bay Area to Central Valley Program EIR/EIS*, and (3) *2012 Partially Revised Final Program EIR* into the high-speed rail (HSR) project. The Authority and FRA will implement these features during project design and construction, as relevant to the San Jose to Merced Project Section (Project Section), to avoid or reduce impacts.

IAMFs are incorporated into the Project Section design and construction to avoid or minimize environmental or community impacts. The description of each measure details the means and effectiveness of the measure in avoiding or minimizing impacts, as well as the environmental benefits of implementing the measure. For example, an IAMF can require development and application of measures to reduce impacts on air quality and hydrology based on applicable design standards that will also reduce impacts on biological resources.

Each IAMF is described in the EIR/EIS. The factual basis for their efficacy, feasibility, and implementation is provided. The IAMFs are included in the Mitigation Monitoring and Enforcement Plan to enhance implementation tracking, identify the responsible party, and clarify implementation timing.

Descriptions of Impact Avoidance and Minimization Features

AG-IAMF#1: Restoration of Important Farmland Used for Temporary Staging Areas

Prior to any ground disturbing activities at the site of a temporary construction staging area located on Important Farmland, the Contractor shall prepare a restoration plan addressing specific actions, sequence of implementation, parties responsible for implementation and successful achievement of restoration for temporary impacts. Actions shall include removing and stockpiling the top 18 inches of soil for replacement on-site during restoration activities. Before beginning construction use of sites on Important Farmland, the Contractor shall submit the restoration plan to the Authority for review and obtain Authority (and if applicable, the landowner) approval. The restoration plan shall include time-stamped photo documentation of the pre-construction conditions of all temporary staging areas.

All construction access, mobilization, material laydown, and staging areas on Important Farmlands will be returned to a condition equal to the pre-construction staging condition. This requirement is included in the design-build construction contract requirements.

AG-IAMF#2: Permit Assistance

Prior to disturbance causing activities affecting any segment of a confined animal facility, the Authority will assign a representative to act as a single point of contact to assist each confined animal facility owner during the process of obtaining new or amended permits or other regulatory compliance necessary to the continued operation or relocation of the facility. The Authority will consider and may provide compensation when acquisition of a confined animal site will require either relocation of the facility or amendment of its existing regulatory permits. The Authority will create a permit assistance center for landowners and operators whose operations will be out of compliance with permits because of the HSR. This permit center will focus on helping the permit holders modify or obtain any new permits that are required because of the HSR impacts.

AG-IAMF#3: Farmland Consolidation Program

The Authority will establish and administer a farmland consolidation program to sell remnant parcels to neighboring landowners for consolidation with adjacent farmland properties. In addition, the program will assist the owners of remnant parcels in selling those remnants to adjacent landowners, upon request. The goal of the program is to provide for continued agricultural use on the maximum feasible amount of remnant parcels that otherwise may not be economic to farm. The program will focus on severed remainder parcels, including those that were under Williamson Act or Farmland Security Act contract at the time of right-of-way acquisition and have become too small to remain in the local Williamson Act or Farmland Security Act program. The program will assist landowners in obtaining lot line adjustments where appropriate to incorporate remnant parcels into a larger parcel that is consistent with size requirements under the local government regulations.

The program will operate for a minimum of 5 years after construction of the section is completed. The Authority shall document implementation of this measure through issuance of a compliance memorandum- after the minimum operation period of 5 years has elapsed. The document shall be filed with Environmental Mitigation Management and Assessment system (EMMA).

AG-IAMF#4: Notification to Agricultural Property Owners

Prior to the start of any construction activity adjacent to farmland, the Authority shall provide written notification to agricultural property owners or leaseholders immediately adjacent to the disturbance limits for the HSR project section. The notification is to indicate the intent to begin construction, including an estimated date for the start of construction. In order to provide agricultural property owners or leaseholders sufficient lead time to make any changes to their operations due to project section construction, this notification shall be provided at least 3 months, but no more than 12 months, prior to the start of construction activity.

AG-IAMF#5: Temporary Livestock and Equipment Crossings

Prior to the start of any construction activity adjacent to any farmland, the Authority shall coordinate with agricultural property owners or leaseholders to provide temporary livestock and equipment crossings to minimize impacts to livestock movement, as well as routine operations and normal business activities, during project construction.

AG-IAMF#6: Equipment Crossings

During final design, and in coordination with the property owners of land in use for agricultural operations, the Authority shall finalize the realignments of any affected access roads to provide equipment crossings to minimize impediments to routine agricultural operations and normal business activities that may result from long-term project operation.

Air Quality

AQ-IAMF#1: Fugitive Dust Emissions

During construction, the Contractor shall employ the following measures to minimize and control fugitive dust emissions. The Contractor shall prepare a fugitive dust control plan for each distinct

construction segment. At a minimum, the plan shall describe how each measure will be employed and identify an individual responsible for ensuring implementation. At a minimum, the plan shall address the following components unless alternative measures are approved by the applicable air quality management district.

- Cover all vehicle loads transported on public roads to limit visible dust emissions, and maintain at least 6 inches of freeboard space from the top of the container or truck bed.
- Clean all trucks and equipment before exiting the construction site using an appropriate cleaning station that does not allow runoff to leave the site or mud to be carried on tires off the site.
- Water exposed surfaces and unpaved roads at a minimum three times daily with adequate volume to result in wetting the top 1 inch of soil while avoiding overland flow. Rain events may sufficiently wet the top 1 inch of soil to alleviate the need to manually apply water.
- Limit vehicle travel speed on unpaved roads to 15 miles per hour (mph).
- Suspend any dust-generating activities when average wind speed exceeds 25 mph.
- Stabilize all disturbed areas, including storage piles that are not being used on a daily basis for construction purposes, by using water, a chemical stabilizer/suppressant, or hydro mulch or by covering with a tarp or other suitable cover or vegetative ground cover. In areas adjacent to organic farms, the Authority will use nonchemical means of dust suppression.
- Stabilize all on-site unpaved roads and off-site unpaved access roads using water or a chemical stabilizer/suppressant. In areas adjacent to organic farms, the Authority will use nonchemical means of dust suppression.
- Apply water to or presoak all areas where land clearing, grubbing, scraping, excavation, land leveling, grading, cut-and-fill, and demolition activities are carried out.
- For buildings up to six stories tall, wet all exterior surfaces of buildings during demolition.
- Limit or expeditiously remove the accumulation of mud or dirt from adjacent public streets at a minimum of once daily, using a vacuum type sweeper.
- After the addition of materials to or the removal of materials from the surface or outdoor storage piles, apply sufficient water or a chemical stabilizer/suppressant.

AQ-IAMF#2: Selection of Coatings

During construction, the contractor will use:

- Low–volatile organic compound (VOC) paint that contains less than 10 percent of VOC contents (VOC, 10%).
- Super-compliant or Clean Air paint that has a lower VOC content than that required by Bay Area Air Quality Management District Regulation 8, Rule 3, Monterey Bay Unified Air Pollution Control District Rule 426, and San Joaquin Valley Unified Air Pollution Control District Rule 4601, when available. If not available, the contractor will document the lack of availability, recommend alternative measure(s) to comply with Regulation 8, Rule 3, Rule 426, and Rule 4601 or disclose absence of measure(s) for full compliance, and obtain concurrence from the Authority.

AQ-IAMF#3: Renewable Diesel

During construction, the Contractor will use renewable diesel fuel to minimize and control exhaust emissions from all heavy-duty diesel-fueled construction diesel equipment and on-road diesel trucks. Renewable diesel must meet the most recent ASTM D975 specification for Ultra Low Sulfur Diesel and have a carbon intensity no greater than 50% of diesel with the lowest carbon intensity among petroleum fuels sold in California. The Contractor will provide the Authority with monthly and annual reports, through the Environmental Mitigation Management and Application

(EMMA) system, of renewable diesel purchase records and equipment and vehicle fuel consumption. Exemptions to use traditional diesel can be made where renewable diesel is not available from suppliers within 200 miles of the project site. The construction contract must identify the quantity of traditional diesel purchased and fully document the availability and price of renewable diesel to meet project demand.

AQ-IAMF#4: Reduce Criteria Exhaust Emissions from Construction Equipment

Prior to issuance of construction contracts, the Authority will incorporate the following construction equipment exhaust emissions requirements into the contract specifications:

- All heavy-duty off-road construction diesel equipment used during the construction phase will meet Tier 4 engine requirements.
- A copy of each unit's certified tier specification and any required CARB or air pollution control district operating permit will be made available to the Authority at the time of mobilization of each piece of equipment.
- The contractor will keep a written record (supported by equipment-hour meters where available) of equipment usage during project construction for each piece of equipment.
- The contractor will provide the Authority with monthly reports of equipment operating hours (through the Environmental Mitigation Management and Assessment [EMMA] system) and annual reports documenting compliance.

AQ-IAMF#5: Reduce Criteria Exhaust Emissions from On-Road Construction Equipment

Prior to issuance of construction contracts, the Authority will incorporate the following material-hauling truck fleet mix requirements into the contract specifications:

- All diesel on-road trucks used to haul construction materials, including fill, ballast, rail ties, and steel, shall use a model year 2010 or newer engine.
- The contractor will provide documentation to the Authority of efforts to secure such a fleet mix.
- The contractor will keep a written record of equipment usage during project construction for each piece of equipment and provide the Authority with monthly reports of VMT (through EMMA) and annual reports documenting compliance.

AQ-IAMF#6: Reduce the Potential Impact of Concrete Batch Plants

Prior to construction of any concrete batch plant, the contractor will provide the Authority with a technical memorandum documenting consistency with the Authority's concrete batch plant siting criteria and utilization of typical control measures. Concrete batch plants will be sited at least 1,000 feet from sensitive receptors, including places such as daycare centers, hospitals, senior care facilities, residences, parks, and other areas where people may congregate. The concrete batch plant will implement typical control measures to reduce fugitive dust such as water sprays, enclosures, hoods, curtains, shrouds, movable and telescoping chutes, central dust collection systems, and other suitable technology, to reduce emissions to be equivalent to the USEPA AP-42 controlled emission factors for concrete batch plants. The contractor will provide to the Authority documentation that each batch plant meets this standard during operation.

Aesthetics and Visual Quality

AVQ-IAMF#1: Aesthetic Options

Prior to construction the Contractor shall document, through issue of a technical memorandum, how the Authority's aesthetic guidelines have been employed to minimize visual impacts. The Authority seeks to balance providing a consistent, project-wide aesthetic with the local context for the numerous high-speed rail non-station structures across the state. Examples of aesthetic

options will be provided to local jurisdictions that can be applied to non-standard structures in the high-speed rail system. Refer to Aesthetic Options for Non-Station Structures, 2017.

AVQ-IAMF#2: Aesthetic Review Process

Prior to construction, the contractor will document that the Authority's aesthetic review process has been followed to guide the development of non-station area structures. Documentation will be accomplished through issuance of a technical memorandum to the Authority. The Authority will identify key non-station structures recommended for aesthetic treatment; consult with local jurisdictions on how best to involve the community in the process; solicit input from local jurisdictions on their aesthetic preferences; evaluate aesthetic preferences for potential cost, schedule, and operational impacts and compatibility with project-wide aesthetic goals, include recommended aesthetic approaches in the construction procurement documents; and work with the contractor and local jurisdictions to review and incorporate designs and local aesthetic preferences into final design and construction. *Refer to Aesthetic Options for Non-Station Structures, 2017*.

Biological Resources

BIO-IAMF#1: Project Biologist

At least 15 business days prior to commencement of any ground disturbing activity, including but not limited to geotechnical investigations, utility realignments, creation of staging areas, or initial clearing and grubbing, the Authority will submit the name(s) and qualifications of Project Biologists, Designated Biologists, Species-Specific Biological Monitors, and General Biological Monitors retained to conduct biological resource monitoring activities and implement avoidance and minimization measures. No ground disturbing activity will begin until the Authority has received written approval from the U.S. Fish and Wildlife Service (USFWS), National Marine Fisheries Service (NMFS), where applicable, and the California Department of Fish and Wildlife (CDFW) that the biologists and monitors have been approved to conduct the specified work. The Project Biologist is responsible for ensuring the timely implementation of the biological avoidance and minimization measures as outlined in the Biological Resources Management Plan (BRMP), and for guiding and directing the work of the Designated Biologists and Biological Monitors. Designated Biologists will be responsible for directly overseeing and reporting the implementation of general and species-specific conservation measures. In some instances, Designated Biologists will only be approved for specific species, in which case they will only be authorized to conduct surveys and implement measures for the species for which they have been approved. Species-Specific Biological Monitors will be responsible for implementation of species-specific measures for the species for which they have been approved, and will report directly to a Designated Biologist. General Biological Monitors will report directly to a Designated Biologist or to the Project Biologist. General Biological Monitors will be responsible for conducting Worker Environmental Awareness Program (WEAP) training, implementing general conservation measures, conducting general compliance monitoring, and reporting on compliance monitoring activities. The term Project Biologist is used in these IAMFs to mean the Project Biologist, Designated Biologists, Species-Specific Biological Monitors, and General Biological Monitors, as appropriate. When the Authority is specified as implementing an IAMF, it is assumed that the Authority, or its contractor or agent, is implementing the IAMF under the supervision of biologists and biological monitors, as appropriate.

BIO-IAMF#2: Agency Access

Throughout the construction period, the Authority will allow access by the USFWS, NMFS, U.S. Army Corps of Engineers (USACE), CDFW, and State Water Resources Control Board (SWRCB) to the project site. Because of safety concerns, all visitors will check in with the Authority's resident engineer prior to entering the project footprint. In the event that agency personnel visit the project footprint, the Project Biologist will prepare a memorandum within 3 business days after the visit documenting the issues raised during the field meeting. The Project Biologist will report any issues regarding regulatory compliance raised by agency personnel to the Authority.

BIO-IAMF#3: Construction Period WEAP Training

Prior to any ground disturbing activity, the Project Biologist will prepare a Worker Environmental Awareness Program (WEAP) for the purpose of training construction crews to recognize and identify sensitive biological resources that may be encountered in the vicinity of the project footprint. The WEAP training materials will be submitted to the Authority for review and approval. A video of the WEAP training prepared and presented by the Project Biologist and approved by the Authority may be used if the Project Biologist is not available to present the training in person.

At a minimum, WEAP training materials will include the following information: key provisions of the federal Endangered Species Act (federal ESA), the California Endangered Species Act (CESA), the Bald and Golden Eagle Protection Act (BGEPA), the Migratory Bird Treaty Act (MBTA), California Fish and Game Code 1600, Porter-Cologne Water Quality Control Act (Porter-Cologne), and the Clean Water Act (CWA); the consequences and penalties for violation or noncompliance with these laws and regulations and project authorizations; identification and characteristics of special-status plants, special-status wildlife, jurisdictional waters, and special-status plant communities and explanations about their ecological value; hazardous substance spill prevention and containment measures; the contact person in the event of the discovery of a dead or injured wildlife species; and review of avoidance, minimization, and mitigation measures.

The Project Biologist will present WEAP training to all construction personnel before they work in the project footprint. As part of the WEAP training, construction timing in relation to species' habitat and life-stage requirements will be detailed and discussed on project maps, which will show areas of planned minimization and avoidance measures. Crews will be informed during the WEAP training that, except when necessary as determined in consultation with the Project Biologist, travel within the project footprint is restricted to established roadbeds, which include all pre-existing and project-constructed unimproved and improved roads. A fact sheet conveying this information will be prepared by the Project Biologist for distribution to the construction crews and to others who enter the project footprint. Fact sheet information will be duplicated in a wallet-sized format and will be provided in other languages as necessary to accommodate non-English speaking workers. All construction staff will attend the WEAP training prior to beginning work on-site, and will attend the WEAP training on an annual basis thereafter.

Upon completion of the WEAP training, each member of the construction crew will sign a form stating that they attended the training, understood the information presented, and agreed to comply with the requirements set out in the WEAP training. The Project Biologist will submit the signed WEAP training forms to the Authority on a monthly basis. On an annual basis, the Authority will certify that WEAP training had been provided to all construction personnel. On a monthly basis, the Project Biologist will provide updates relevant to the training to construction personnel during the daily safety ("tailgate") meeting.

BIO-IAMF#4: Operation and Maintenance Period WEAP Training

Prior to initiating operation and maintenance (O&M) activities, O&M personnel will attend a WEAP training session arranged by the Authority.

At a minimum, O&M WEAP training materials will include the following information: key provisions of the ESA, CESA, the BGEPA, the MBTA, Porter-Cologne, and the CWA; the consequences and penalties for violation or noncompliance with these laws and regulations and project authorizations; identification and characteristics of special-status plants, special-status wildlife, jurisdictional waters, and special-status plant communities and explanations about their ecological value; hazardous substance spill prevention and containment measures; and the contact person in the event of the discovery of a dead or injured wildlife species. The training will include an overview of provisions of the biological resources management plan, annual vegetation, and management plan, weed control plan and security fencing and wildlife exclusion fencing maintenance plans pertinent to O&M activities. A fact sheet prepared by the Authority environmental compliance staff will be prepared for distribution to the O&M employees. The training will be provided by the Authority environmental compliance staff. The training sessions will be provided to employees prior to their involvement in any O&M activity and will be repeated

for all O&M employees on an annual basis. Upon completion of the WEAP training, O&M employees will, in writing, verify their attendance at the training sessions and confirm their willingness to comply with the requirements set out in those sessions.

BIO-IAMF#5: Prepare and Implement a Biological Resources Management Plan

Prior to any ground disturbing activity, the Project Biologist will prepare the BRMP, which will include a compilation of the biological resources avoidance and minimization measures applicable to the HSR section. All project environmental plans, such as the Restoration and Revegetation Plan (RPP) and Weed Control Plan (WCP), will be included as appendices to the BRMP. The BRMP is intended to serve as a comprehensive document that sets out the range of avoidance and minimization measures to support the appropriate and timely implementation of those measures. The implementation of these measures will be tracked through final design, construction, and operation phases. The BRMP will contain, but not be limited to, the following information:

- A master schedule that shows construction of the project, pre-construction surveys, and establishment of buffers and exclusions zones to protect sensitive biological resources.
- Specific measures for the protection of special-status species.
- Identification (on construction plans) of the locations and quantity of habitats to be avoided or removed, along with the locations where habitats are to be restored.
- Identification of agency-approved Project Biologist(s) and Biological Monitor(s), including those responsible for notification and report of injury or death of federally or State-listed species.
- Measures to preserve topsoil and control erosion.
- Design of protective fencing around Environmentally Sensitive Areas (ESAs) and the construction staging areas.
- Locations of trees to be protected as wildlife habitat (roosting sites) and locations for planting replacement trees.
- Specification of the purpose, type, frequency, and extent of chemical use for insect and disease control operations as part of vegetative maintenance within sensitive habitat areas.
- Specific measures for the protection of vernal pool habitat and riparian areas. These measures may include erosion and siltation control measures, protective fencing guidelines, dust control measures, grading techniques, construction area limits, and biological monitoring requirements.
- Provisions for biological monitoring during ground disturbing activities to confirm compliance and success of protective measures. The monitoring will: (1) identify specific locations of wildlife habitat and sensitive species to be monitored; (2) identify the frequency of monitoring and the monitoring methods (for each habitat and sensitive species to be monitored); (3) list required qualifications of biological monitor(s); (4) identify the reporting requirements; and (5) provide an accounting of impacts to special-status species habitat compared to pre-construction impact estimates.

The BRMP will be submitted to the Authority for review and approval prior to any ground disturbing activity.

BIO-IAMF#6: Establish Monofilament Restrictions

Prior to any ground disturbing activity, the Project Biologist will verify that plastic monofilament netting (erosion control matting) or similar material is not being used as part of erosion control activities. The Project Biologist will identify acceptable material for such use, including: geomembranes, coconut coir matting, tackified hydroseeding compounds, and rice straw wattles (e.g., Earthsaver wattles: biodegradable, photodegradable, burlap). Within developed or urban

areas, the Project Biologist may allow exceptions to the restrictions on the type of erosion control material if the Project Biologist determines that the construction area is of sufficient distance from natural areas to ensure the avoidance of potential impacts to wildlife.

BIO-IAMF#7: Prevent Entrapment in Construction Materials and Excavations

At the end of each work day during construction, the Authority will cover all excavated, steep-sided holes or trenches more than 8 inches deep and that have sidewalls steeper than 1:1 (45 degree) slope with plywood or similar materials, or provide a minimum of one escape ramp per 100 feet of trenching (with slopes no greater than 3:1) constructed of earth fill or wooden planks. The Project Biologist will thoroughly inspect holes and trenches for trapped animals at the start and end of each work day.

The Authority will screen, cover, or elevate at least 1 foot above ground, all construction pipe, culverts, or similar structures with a diameter of 3 inches or greater that are stored overnight within the project footprint. These pipes, culverts, and similar structures will be inspected by the Project Biologist for wildlife before such material is moved, buried, or capped.

BIO-IAMF#8: Delineate Equipment Staging Areas and Traffic Routes

Prior to any ground disturbing activity, the Authority will establish staging areas for construction equipment in areas that minimize effects to sensitive biological resources, including habitat for special-status species, seasonal wetlands, and wildlife movement corridors. Staging areas (including any temporary material storage areas) will be located in areas that will be occupied by permanent facilities, where practicable. Equipment staging areas will be identified on final project construction plans. The Authority will flag and mark access routes to ensure that vehicle traffic within the project footprint is restricted to established roads, construction areas and other designated areas.

BIO-IAMF#9: Dispose of Construction Spoils and Waste

During ground disturbing activities, the Authority may temporarily store excavated materials produced by construction activities in areas at or near construction sites within the project footprint. Where practicable, the Authority will return excavated soil to its original location to be used as backfill. Any excavated waste materials unsuitable for treatment and reuse will be disposed at an off-site location, in conformance with applicable State and federal laws.

BIO-IAMF#10: Clean Construction Equipment

Prior to any ground disturbing activity, the Authority will ensure that all equipment entering the Work Area is free of mud and plant materials. The Authority will establish vehicle cleaning locations designed to isolate and contain organic materials and minimize opportunities for weeds and invasive species to move in and out of the project footprint. Cleaning may be done by washing with water, blowing with compressed air, brushing, or other hand cleaning. The cleaning areas will be located so as to avoid impacts to surface waters and appropriate Stormwater Pollution Prevention Plan (SWPPP) best management practices (BMPs) will be implemented so as to further control any potential for the spread of weeds or other invasive species. Cleaning stations will be inspected regularly (at least monthly).

BIO-IAMF#11: Maintain Construction Sites

Prior to any ground disturbing activity, the Authority will prepare a construction site BMP field manual. The manual will contain standard construction site housekeeping practices required to be implemented by construction personnel. The manual will identify BMPs for the following topics; temporary soil stabilization, temporary sediment control, wind erosion control, non-storm water management, waste management and materials control, rodenticide use, and other general construction site cleanliness measures.

All construction personnel will receive training on BMP field manual implementation prior to working within the project footprint. All personnel will acknowledge, in writing, their understanding of the BMP field manual implementation requirements. The BMP field manual will be updated by

January 31st of each year. The Authority will provide, on an annual basis, training updates to all construction personnel.

BIO-IAMF#12: Design the Project to be Bird Safe

Prior to final construction design, the Authority will ensure that the catenary system, masts, and other structures such as fencing, electric lines, communication towers and facilities are designed to be bird and raptor-safe in accordance with the applicable recommendations presented in Suggested Practices for Raptor Protection on Power Lines: The State of the Art in 2006 (APLIC 2006) and Reducing Avian Collisions with Power Lines: State of the Art in 2012 (APLIC 2012), and other guidelines related to collisions with buildings available from the American Bird Conservancy (Sheppard and Phillips 2015). Applicable recommendations include, but are not limited to:

- Ensuring sufficient spacing of phase conductors to prevent bird electrocution
- Configuring lines to reduce vertical spread of lines and/or decreasing the span length if such options are feasible
- Marking lines and fences (e.g. Bird Flight Diverter for fencing and lines) to increase the visibility of lines and reduce the potential for collision. Where fencing is necessary, using bird compatible design standards to increase visibility of fences to prevent collision and entanglement.
- Installing perch guards to discourage avian presence on and near project facilities
- Minimizing the use of guywires. Where the use of guywires is unavoidable, demarcating guywires using the best available methods to minimize avian strikes (e.g. line markers).
- Reusing or co-locating new transmission facilities and other ancillary facilities with existing facilities and disturbed areas to minimize habitat impacts and avoid collision risks
- Structures will be monopole or dual-pole design versus lattice tower design to minimize perching and nesting opportunities. Communication towers will conform to Recommended Best Practices for Communication Tower Design, Siting, Construction, Operation, Maintenance, and Decommissioning (UFWS 2018).
- Use of facility lighting that does not attract birds or their prey to project sites. These include using non-steady burning lights (red, dual red and white strobe, strobe-like flashing lights) to meet Federal Aviation Administration requirements, using motion or heat sensors and switches to reduce the time when lights are illuminated, using appropriate shielding to reduce horizontal or skyward illumination, and avoiding the use of high-intensity lights (e.g., sodium vapor, quartz, and halogen). Lighting will not be installed under viaduct and bridge structures in riparian habitat areas.
- Use of facility designs and architecture that minimizes the potential for bird collisions with buildings, to the extent feasible and consistent with local design requirements.

Additional bird operational actions will be required for the Grasslands Ecological Area, dry lakes and playas, Audubon Important Bird Areas and documented avian movement corridors. These measures include:

- Avoid, to the extent feasible, siting transmission lines across canyons or on ridgelines to prevent bird and raptor collisions.
- Install bird flight diverters on all facilities spanning or within 1,000 feet of stream and wash channels, canals, ponds, and any other natural or artificial body of water.
- Fencing or other type of flight diverter will be installed on all viaduct structures to encourage birds and raptors to fly over the HSR and avoid flying directly in the path of on-coming trains.

- Use of bird-friendly lighting on all stationary light sources (i.e., lighting with shorter wavelengths toward the blue and green spectrum), provided it is consistent with safety and security requirements.

Cultural Resources

CUL-IAMF#1: Geospatial Data Layer and Archaeological Sensitivity Map

Prior to Construction (any ground disturbing activities) and staging of materials and equipment, the Contractor's archaeologist or geoarchaeologist shall prepare a geospatial data layer identifying the locations of all known archaeological resources and built historic resources that require avoidance or protection, and areas of archaeological sensitivity that require monitoring within the area of potential effect (APE). The Contractor's archaeologist, who meets the Secretary of the Interior's Professional Qualifications Standards provided in 36 Code of Federal Regulations (CFR) Part 61, is to use, as appropriate, a combination of the following: known locations of archaeological sites and built historic properties, tribal consultation, landforms, depositional processes, distance to water, mapping provided in the Archaeological Treatment Plan, or historic mapping. This mapping is to be updated as the design progresses if it results in an expansion of the area of ground disturbance/APE, including temporary construction easements and new laydown and access areas. This mapping will be used to develop an archaeological monitoring plan to be prepared by the Contractor's archaeologist, and upon approval by the Authority, implemented by the Contractor's archaeologist. When design is sufficiently advanced, a geospatial data layer will be produced by the Contractor overlaying the locations of all known archaeological resources and built historic resources within the APE, for which avoidance measures are necessary, and all archaeologically sensitive areas, for which monitoring is required.

CUL-IAMF#2: WEAP Training Session

Prior to Construction (any ground disturbing activity) construction contractor personnel who work on site will attend a WEAP training session provided by the Contractor. The WEAP will include cultural resources awareness training performed by the Contractor's archaeologist who meets the Secretary of the Interior's Professional Qualification Standards provided in 36 CFR Part 61. The Contractor will develop instructional materials and a fact sheet for distribution to the construction crews, and submit the materials, as well as qualifications of the personnel providing the training, to the Authority for approval at least 15 days prior to being permitted on-site access. The training will address measures required to avoid or protect built historic resources, educate crews on artifacts and archaeological features they may encounter and the mandatory procedures to follow should potential cultural resources be exposed during construction. Translation services shall be provided by the Contractor for non-English speaking participants. The training sessions shall be given prior to the initiation of any ground disturbance activities and repeated on an annual basis. Additionally, new construction crewmembers shall attend an initial WEAP training session prior to working on site.

On completion of the WEAP training, construction crews will sign a form stating that they attended the training, understood the information presented, and will comply with the WEAP requirements. The Contractor's archaeologist will submit the signed WEAP training forms to the Mitigation Manager on a monthly basis. On an annual basis, the Contractor will provide the Authority with a letter indicating that regular WEAP training has been implemented and will provide at least one PowerPoint annually of the WEAP training. On a monthly basis, the Contractor's archaeologist will provide updates and synopsis of the training to workers during the daily safety ("tailgate") meeting. Construction crews will be informed during the WEAP training that, to the extent possible, travel within the marked project site will be restricted to established roadbeds.

CUL-IAMF#3: Pre-Construction Cultural Resource Surveys

Prior to Construction (any ground disturbing activities in areas not yet surveyed) and the staging of materials and equipment, the Contractor shall conduct pre-construction cultural resource

surveys. Resulting from lack of legal access, much of the construction footprint may not have been surveyed. Once parcels are accessible the Contractor will have archaeologists or architectural historians, as appropriate, who meet the Secretary of the Interior professional qualification standards survey and complete reporting in appropriate document for archaeology and / or built resources, in accordance with documentation requirements stipulated in the Programmatic Agreement. Identified resources shall be evaluated for the National Register of Historic Places (NRHP) and the California Register of Historical Resources (CRHR). The qualified archaeologist or architectural historian, as appropriate, will assess the potential to affect to historic properties (NRHP) by applying the effects criteria in 36 CFR Part 800.5(a)(1), and the potential of significant impacts to historical resources (CRHR) by applying the criteria in California Environmental Quality Act (CEQA) Guidelines 15064.5(b). Should the Authority and FRA determine, in consultation with the State Historic Preservation Office (SHPO), that any newly identified historic properties or historical resources will be adversely affected, the Built Environment Treatment Plan or Archeological Treatment Plan, as appropriate, will be amended, to document mitigation measures agreed upon by the MOA signatories. The schedule of these surveys will be dependent on the timing of obtaining legal access to the properties and may be driven by the need to complete construction-related activities, e.g., geotechnical borings, laydown yards, etc. Prior to beginning surveys, updated records searches may be required by the FRA and Authority, depending on the length of the passage of time, to validate that accurate information was obtained regarding previous inventory and evaluation efforts. The Contractor's archaeologist, in consultation with the Authority, will determine if an updated records search is required. If an updated records search is necessary, the search shall be performed by the Contractor's archaeologist.

CUL-IAMF#4: Relocation of Project Features when Possible

Changing the rail alignment to avoid newly discovered sites is likely infeasible; however, access areas and laydown sites may be relocated should their proposed location be found to be on archaeological sites or have the potential to affect historic built resources in the vicinity. The contractor will delineate all avoidance and protection measures for identified archaeological and built resources on construction drawings.

CUL-IAMF#5: Archaeological Monitoring Plan and Implementation

Prior to construction the Contractor's professionally qualified archaeologist, as defined in the Programmatic Agreement, will prepare a monitoring plan based on the results of geospatial data layer and archaeological sensitivity map. The plan is to be reviewed and approved by the Authority prior to any ground-disturbing activities. During Construction (any ground disturbing activities) or staging of materials or equipment, the Contractor will be responsible for implementing the monitoring plan and providing archaeological and tribal monitoring of ground-disturbing construction activities with a potential to affect archaeological remains in areas identified as archaeologically sensitive in the Archaeological Treatment Plan. The Contractor shall obtain Authority approval of all persons providing archaeological or tribal monitoring.

CUL-IAMF#6: Pre-Construction Conditions Assessment, Plan for Protection of Historic Built Resources, and Repair of Inadvertent Damage

Prior to Construction (any ground disturbing activities that are within 1,000 feet of a historic built property) the Contractor may be required to assess the condition of construction-adjacent historic properties, and prepare a Plan for the Protection of Historic Built Resources and Repair of Inadvertent Damage. The MOA and Built Environment Treatment Plan (BETP) will stipulate for which properties the plan is to be prepared. MOA signatories and consulting parties may comment on the adequacy of the assessments. Protection measures will be developed in consultation with the landowner or land-owning agencies as well as the SHPO and the MOA signatories and consulting parties, as required by the Programmatic Agreement. As the design progresses, additional properties may be identified by the Authority as requiring this plan. The plan shall record existing conditions in order to (1) establish a baseline against which to compare the property's post-project condition, (2) to identify structural deficiencies that make the property

vulnerable to project construction related damage, such as vibration, and (3) to identify stabilization or other measures required to avoid or minimize inadvertent adverse effects. The plan will be further described in the BETP and be prepared by an interdisciplinary team, including (but not limited to) as appropriate, an architectural historian, architect, photographer, structural engineer, and acoustical engineer. Ambient conditions will be used to identify buildings that are sensitive receptors to construction-related vibration and require vibration monitoring during construction activities. Additional protective measures may be required if the property is vacant during construction.

The plan content shall be outlined in the BETP and is to be completed and approved by the Authority, with protective measures implemented before construction begins within 1,000 feet of the subject building. The plan shall describe the protocols for documenting inadvertent damage (should it occur), as well as notification, coordination, and reporting to the SHPO, MOA signatories, and the owner of the historic property. The plan shall direct that inadvertent damage to historic properties shall be repaired in accordance with the Secretary of the Interior's (SOI) Standards for the Treatment of Historic Properties (U.S. Department of the Interior, 1995). The plan shall be developed in coordination with the Authority and FRA, and shall be submitted to the SHPO for review and approval. Protective plans will be required for buildings that will be moved as part of the project mitigation, including stabilization before, during, and after relocation; protection during temporary storage; and relocation to a new site, followed by rehabilitation.

CUL-IAMF#7: Built Environment Monitoring Plan

Prior to Construction (any ground disturbing activities within 1,000 feet of a historic property or resource) the Contractor shall prepare a Built Environment Monitoring Plan (BEMP). Draft and final BEMP's will be prepared describing the properties that will require monitoring, the type of activities or resources that will require full-time monitoring or spot checks, the required number of monitors for each construction activity, and the parameters that will influence the level of effort for monitoring. Maximum vibration level thresholds may be established in the Plan for Protection of Historic Resources and Repair of Inadvertent Damage the monitoring of which will be included in this monitoring plan. The BETP will outline the process for corrective action should the protection measures prove ineffective. Consultation procedures will also be defined in the BETP. The Contractor shall develop both the draft and final plans in coordination with the Authority and FRA, and shall be submitted to the SHPO for review and approval. The plan will be implemented prior to any ground-disturbing activities within 1,000 feet of properties identified as requiring monitoring, as specified in the BETP.

CUL-IAMF#8: Implement Protection and/or Stabilization Measures

Implement the plan described in the Plan for Protection of Historic Resources and Repair of Inadvertent Damage and in the Built Environment Treatment Plan. Such protection measures will include, but will not be limited to, vibration monitoring of construction in the vicinity of historic properties; cordoning off of resources from construction activities (e.g., traffic, equipment storage, personnel); shielding of resources from dust or debris; and stabilization of buildings adjacent to construction. Temporary stabilization and protection measures will be removed after construction is complete, and the historic properties will be restored to their pre-construction condition. For buildings that will be moved, treatment will include stabilization before, during, and after relocation; protection during temporary storage; and relocation to a new site, followed by rehabilitation.

EMI/EMF Standards

EMI/EMF-IAMF#1: Preventing Interference with Adjacent Railroads

TM 3.00.10. Implementation Stage Electromagnetic Compatibility Program Plan (ISEP) requires coordination with adjacent railroads. During Project Design the Contractor will work with the engineering departments of railroads that operate parallel the HSR to apply standard design practices to prevent interference with the electronic equipment operated by these railroads. Prior to Operation and Maintenance of each operating segment, the Contractor shall certify through

issuance of a technical memorandum to the Authority that design provisions to prevent interference have been established and have been determined to be effective prior to the activation of potentially interfering systems of the HSR.

The contractor will work with the railroad engineering departments where these railways parallel the HSR to apply the standard design practices to prevent interference with the electronic equipment operated by these railroads. Design provisions to prevent interference will be put in place and determined to be adequately effective by a qualified electrical engineering professional prior to the HSR activation of potentially interfering systems. The HSR Design Criteria Manual (DCM) Chapter 26 summarizes the applicable electromagnetic interference/electromagnetic field (EMI/EMF) design standards that the Authority will use for the project.

EMI/EMF-IAMF#2: Controlling Electromagnetic Fields/Electromagnetic Interference

Prior to Construction, the Contractor will prepare an electromagnetic field/electromagnetic interference technical memorandum for review and approval by the Authority. The HSR project shall adhere to international guidelines and comply with applicable federal and state laws and regulations. The HSR project design will follow TM 300.10, ISEP, the CHSR DCM Chapter 26, which provides detailed EMC design criteria for the HSR systems and equipment, and the HSR DCM Chapter 22, which addresses grounding requirements for third-party metallic structures, including fences and pipelines, which are parallel and adjacent to the CHSTS right of way. These documents describe the design practices to avoid EMI and to provide for HSR operational safety. Some measures of the ISEP include:

- During the planning stage through system design, the Authority will perform electromagnetic compatibility (EMC)/EMI safety analyses, which will include identification of existing nearby radio systems, design of systems to prevent EMI with identified neighboring uses, and incorporation of these design requirements into bid specifications used to procure radio systems.
- Pipelines and other linear metallic objects that are not sufficiently grounded through the direct contact with earth will be separately grounded in coordination with the affected owner or utility to avoid possible shock hazards. For cases where metallic fences are purposely electrified to inhibit livestock or wildlife from traversing the barrier, specific insulation design measures will be implemented.
- HSR standard corrosion protection measures will be implemented to eliminate risk of substantial corrosion of nearby metal objects.

Geologic Resources

GEO-IAMF#1: Geologic Hazards

Prior to Construction, the Contractor shall prepare a Construction Management Plan (CMP) addressing how the Contractor will address geologic constraints and minimize or avoid impacts to geologic hazards during construction. The plan will be submitted to the Authority for review and approval. At a minimum, the plan will address the following geological and geotechnical constraints/resources:

a. Groundwater Withdrawal. Controlling the amount of groundwater withdrawal from the project, by re-inject groundwater at specific locations if necessary, or use alternate foundation designs to offset the potential for settlement. This control is important for locations with retained cuts in areas where high groundwater exists, and where existing buildings are located near the depressed track section.

b. Unstable Soils. Employing various methods to mitigate for the risk of ground failure from unstable soils. If soft or loose soils are encountered at shallow depths, they can be excavated and replaced with competent soils. To limit the excavation depth, replacement materials can also be strengthened using geosynthetics. Where unsuitable soils are deeper, ground

improvement methods, such as stone columns, cement deep-soil-mixing (CDSM), or jet-grouting, can be used. Alternatively, if sufficient construction time is available, preloading—in combination with prefabricated vertical drains (wicks) and staged construction—can be used to gradually improve the strength of the soil without causing bearing-capacity failures.

c. Subsidence. The Authority addresses subsidence in its design and construction processes. For the initial design, survey monuments were installed to establish a datum and set an initial track profile. In the construction phase, the design-build (DB) contractors for track bed preparation will conduct topographic surveys for preparation of final design. Because subsidence could have occurred since the original benchmarks (survey monuments) were established, the DB contractor's topographic surveys will be used to help determine whether subsidence has occurred. The updated topographic surveys will also be used to establish the top of rail elevations for final design where the HSR system is outside established floodplain areas and above water surface elevations. Where the HSR system is in floodplain areas susceptible to flooding, consideration is being given to overbuild the height of the rail bed in anticipation of future subsidence.

d. Water and Wind Erosion. The Contractor will implement erosion control methods as appropriate from the various erosion control methods documented in the Construction Storm Water Pollution Prevention Plan (SWPPP) (See HYD-IAMF#3), the Caltrans Construction Manuals, and the construction technical memorandum (see GEO-IAMF#6), and in coordination with other erosion, sediment, stormwater management and fugitive dust control efforts. Water and wind erosion control methods may include, but are not limited to, use of revegetation, stabilizers, mulches, and biodegradable geotextiles.

e. Soils with Shrink-Swell Potential. In locations where shrink-swell potential is marginally unacceptable, soil additives will be mixed with existing soil to reduce the shrink-swell potential. Construction specifications will be based upon the decision whether to remove or treat the soil. This decision is based on the soils, specific shrink-swell characteristics, the additional costs for treatment versus excavation and replacement, as well as the long-term performance characteristics of the treated soil.

f. Soils with Corrosive Potential. In locations where soils have a potential to be corrosive to steel and concrete, the soils will be removed and buried structures will be designed for corrosive conditions, and corrosion-protected materials will be used in infrastructure.

GEO-IAMF#2: Slope Monitoring

During Operation and Maintenance, the Authority shall incorporate slope monitoring by a Registered Engineering Geologist into the Operation and Maintenance procedures. The procedures shall be implemented at sites identified in the CMP where a potential for long-term instability exists from gravity or seismic loading including but not limited to at-grade sections where slope failure could result in loss of track support, or where slope failure could result in additional earth loading to foundations supporting elevated structures.

GEO-IAMF#3: Gas Monitoring

Prior to Construction, the Contractor shall prepare a Construction Management Plan (CMP) addressing how gas monitoring will be incorporated into construction best management practices. The CMP will be submitted to the Authority for review and approval. Hazards related to potential migration of hazardous gases due to the presence of known oil and gas fields, areas of active or historic landfills, or other subsurface sources can be reduced or eliminated by following strict federal and state Occupational Safety & Health Administration (OSHA/Cal-OSHA) regulatory requirements for excavations, and by consulting with other agencies as appropriate, such as the Department of Conservation (Division of Oil and Gas) and the California Environmental Protection Agency, Department of Toxic Substances Control, regarding known areas of concern.

Practices will include using safe and explosion-proof equipment during construction, and testing for gases regularly. Installation of passive or active gas venting systems, gas collection systems, as well as active monitoring systems and alarms will be required in underground construction

areas and facilities where subsurface gases are present. Installing gas-detection systems can monitor the effectiveness of these systems.

GEO-IAMF#4: Historic or Abandoned Mines

Prior to Construction, the Contractor shall prepare a Construction Management Plan (CMP) addressing how historic and abandoned mines will be incorporated into construction best management practices. The CMP will be submitted to the Authority for review and approval. Depending on the properties of an individual mine, mitigations to address historic or abandoned mines could include:

a. CERCLA Cleanup. Environmental cleanups at sites that are releasing or threatening to release hazardous substances such as heavy metals from acid mine drainage.

b. Non-CERCLA Cleanup. Cleanups of non-hazardous substance-related surface disturbance such as revegetation of disturbed areas, stabilization of mine tailings, reconstruction of stream channels and floodplains.

c. Safety Mitigation. Mitigation of physical safety hazards such as closure of adits and shafts and removal of dangerous structures.

GEO-IAMF#5: Hazardous Minerals

Prior to Construction, the Contractor shall prepare a Construction Management Plan (CMP) addressing how the contractor will minimize or avoid impacts related to hazardous minerals (i.e., radon, mercury, and naturally occurring asbestos (NOA)) during construction. The CMP will be submitted to the Authority for review and approval. The CMP shall include appropriate provisions for handling hazardous minerals including but limited to dust control, control of soil erosion and water runoff, and testing and proper disposal of excavated material.

GEO-IAMF#6: Ground Rupture Early Warning Systems

Prior to Construction, the Contractor shall document how the project design incorporates installation of early warning systems, triggered by strong ground motion association with ground rupture. Known nearly active fault will be monitored. Linear monitoring systems such as time domain reflectometers or similar technology shall be installed along rail lines in the zone of potential ground rupture. These devices emit electronic information that is processed in a centralized location and will be used to temporarily control trains, thus reducing accidents due to fault creep. Damage to infrastructure from fault creep can be mitigated with routine maintenance including minor realignment.

GEO-IAMF#7: Evaluate and Design for Large Seismic Ground Shaking

Prior to Construction, the Contractor shall document through preparation of a technical memorandum how all HSR components were evaluated and designed for large seismic ground shaking. Prior to final design, the Contractor will conduct additional seismic studies to establish up-to-date estimation of levels of ground motion. The most current Caltrans seismic design criteria at the time of design will be used in the design of any structures supported in or on the ground. These design procedures and features reduce to the greatest practical extent for potential movements, shear forces, and displacements that result from inertial response of the structure. In critical locations, pendulum base isolators may be used to reduce the levels of inertial forces. New composite materials may also be used to enhance seismic performance.

GEO-IAMF#8: Suspension of Operations During an Earthquake

Prior to Operation and Maintenance activities, the Contractor shall document in a technical memorandum how suspension of operations during or after an earthquake was addressed in project design. Motion-sensing instruments to provide ground motion data and a control system to shut down HSR operations temporarily during or after a potentially damaging earthquake will be incorporated into final design. Monitoring equipment will be installed at select locations where high ground motions could occur. The system will then be inspected for damage due to ground motion and/or ground deformation, and then returned to service when appropriate.

GEO-IAMF#9: Subsidence Monitoring

Prior to Operation and Maintenance, the Authority shall develop a stringent track monitoring program. Once tracks are operational, a remote monitoring program will be implemented to monitor the effects of ongoing subsidence. Track inspection systems will provide early warning of reduced track integrity. HSR train sets will be equipped with autonomous equipment for daily track surveys. This specification will be added to HSR train bid packages. If monitoring indicates that track tolerances are not met, trains will operate at reduced speed until track tolerances are restored. In addition, the contractor responsible for wayside maintenance will be required to implement a stringent program for track maintenance.

GEO-IAMF#10: Geology and Soils

Prior to Construction, the Contractor shall document through issuance of a technical memorandum how the following guidelines and standards have been incorporated into facility design and construction:

- 2015 American Association of State Highway and Transportation Officials (AASHTO) Load and Resistance Factor Bridge Design Specifications and the 2015 AASHTO Guide Specifications for Load and Resistance Factor Seismic Bridge Design, or their most recent versions. These documents provide guidance for characterization of soils, as well as methods to be used in the design of bridge foundations and structures, retaining walls, and buried structures. These design specifications will provide minimum specifications for evaluating the seismic response of the soil and structures.
- Federal Highway Administration (FHWA) Circulars and Reference Manuals: These documents provide detailed guidance on the characterization of geotechnical conditions at sites, methods for performing foundation design, and recommendations on foundation construction. These guidance documents include methods for designing retaining walls used for retained cuts and retained fills, foundations for elevated structures, and at-grade segments. Some of the documents include guidance on methods of mitigating geologic hazards that are encountered during design.
- American Railway Engineering and Maintenance-of-Way Association (AREMA) Manual: These guidelines deal with rail systems. Although they cover many of the same general topics as AASHTO, they are more focused on best practices for rail systems. The manual includes principles, data, specifications, plans, and economics pertaining to the engineering, design, and construction of railways.
- California Building Code: The code is based on 2015 International Building Code (IBC). This code contains general building design and construction requirements relating to fire and life safety, structural safety, and access compliance.
- IBC and American Society of Civil Engineers (ASCE)-7: These codes and standards provide minimum design loads for buildings and other structures. They will be used for the design of the maintenance facilities and stations. Sections in IBC and ASCE-7 provide minimum requirements for geotechnical investigations, levels of earthquake ground shaking, minimum standards for structural design, and inspection and testing requirements.
- Caltrans Design Standards: Caltrans has specific minimum design and construction standards for all aspects of transportation system design, ranging from geotechnical explorations to construction practices. These amendments provide specific guidance for the design of deep foundations that are used to support elevated structures, for design of mechanically stabilized earth (MSE) walls used for retained fills, and for design of various types of cantilever (e.g., soldier pile, secant pile, and tangent pile) and tie-back walls used for retained cuts.
- Caltrans Construction Manuals: Caltrans has a number of manuals including Field Guide to Construction Dewatering, Caltrans Construction Site BMPs Manual and Construction Site BMP Field Manual and Troubleshooting Guide. These provide guidance and best

management practices for dewatering options and management, erosion control and soil stabilization, non-storm water management, and waste management at construction sites.

- American Society for Testing and Materials (ASTM): ASTM has developed standards and guidelines for all types of material testing- from soil compaction testing to concrete-strength testing. The ASTM standards also include minimum performance requirements for materials.

GEO-IAMF#11: Engage a Qualified Paleontological Resources Specialist

Prior to the 90% design milestone for each construction package[1] (CP) within the Project Section, the Contractor will retain a paleontological resources specialist (PRS) responsible for

- reviewing the final design for the CP, and
- developing a detailed Paleontological Resources Monitoring and Mitigation Plan (PRMMP) for the CP. The PRS will be responsible for implementing the PRMMP, including delivery of WEAP Training, and evaluation and treatment of finds, if any, per the PRMMP and for each CP. A Supervising Paleontologist, who is also a PRS, will be retained and act as Lead Paleontologist for the CP if there are multiple PRS' retained for a single CP.

Retention of PRS staff will occur in a timely manner, in advance of the 90% design milestone for each CP, such that the PRS is on board and can review the 90% design submittal without delay when it becomes available. If feasible, the same PRS will be responsible for all CPs within the Project Section. However, if efficiency dictates, separate qualified PRSs may be retained for the various Project Section CPs. Should a CP retain more than one PRS, a supervising paleontologist will be identified.

All PRS staff will meet or exceed the qualifications for a Principal Paleontologist as defined in the California Department of Transportation's (Caltrans') current *Standard Environmental Reference*, Chapter 8 (Caltrans 2014). Appointment of PRS staff will be subject to review and approval by the Authority.

GEO-IAMF #12: Perform Final Design Review and Triggers Evaluation

For each CP within the Project Section, the responsible PRS will evaluate the 90% design submittal to identify the portions of the CP that will involve work in paleontologically sensitive geologic units (either on the surface or in the subsurface), in consideration of the final Paleontological Resources Technical Report prepared for the Project Section. Evaluation will consider the location, areal extent, anticipated depth of disturbance, the construction techniques that are planned/proposed, and the geology of the CP and vicinity. The evaluation and resulting recommendations will be consistent with guidance in the Society of Vertebrate Paleontology (SVP) *Standard Procedures for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources* (SVP Impact Mitigation Guidelines Revision Committee 2010), the *SVP Conditions of Receivership for Paleontologic Salvage Collections* (SVP Conformable Impact Mitigation Guidelines Committee 1996), and relevant guidance from Chapter 8 of the current Caltrans *Standard Environmental Reference* (Caltrans 2014).

The purpose of the Final Design Review and Triggers Evaluation will be to develop specific language detailing the paleontological monitoring and other requirements applicable to each CP within the Project Section. Paleontological protection requirements identified through the Final Design Review and Triggers evaluation will be recorded in a concise technical memorandum ("Final Design Review Requirements for Paleontological Resources Protection") and will then be incorporated in full detail into the PRMMP for each CP. Portions of the CP requiring paleontological monitoring will also be clearly delineated in the project construction documents for each CP.

[1] Because of their length and complexity, most HSR Project Sections are expected to be designed and constructed in segments, with separate construction documents (plans and specifications) developed for each segment. *Construction package* refers to a portion (segment) of a Project Section for which a discrete, stand-alone construction document set will be developed.

GEO-IAMF#13: Prepare and Implement Paleontological Resources Monitoring and Mitigation Plan (PRMMP)

Following the Final Design Review and Triggers Evaluation for each CP, the PRS will develop a CP-specific PRMMP. For greater efficiency, PRMMPs may be combined such that they cover more than one CP, as long as the specific requirements of this IAMF are satisfied explicitly and in detail for each CP included.

The PRMMP for each CP will incorporate the findings of the Design Review and Triggers Evaluation for that CP and will be consistent with the Society of Vertebrate Paleontology (SVP) *Standard Procedures for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources* (SVP Impact Mitigation Guidelines Revision Committee 2010), the SVP *Conditions of Receivership for Paleontologic Salvage Collections* (SVP Conformable Impact Mitigation Guidelines Committee 1996), and relevant guidance from Chapter 8 of the current Caltrans *Standard Environmental Reference* (Caltrans 2014). As such, the PRMMP will provide for at least the following:

- Implementation by qualified personnel, as follows:
  - The PRS will be required to meet or exceed Principal Paleontologist Qualifications per Chapter 8 of the current *Caltrans Standard Environmental Reference* (Caltrans 2014). The Supervising Paleontologist may, but not necessarily, be the PRS who prepares the PRMMP.
  - Paleontological Monitors will be required to meet or exceed Paleontological Monitor qualifications per Chapter 8 of the current Caltrans *Standard Environmental Reference* (Caltrans 2014).
- Pre-construction survey by qualified personnel, with salvage or protection in place, as appropriate, in areas where the CP will result in surface disturbance of geologic units identified as highly sensitive for paleontological resources (“highly sensitive units”).
- Pre-construction and construction-period coordination procedures and communications protocols.
- Paleontological monitoring by qualified staff for all ground-disturbing activities known to involve, or potentially involve, highly sensitive units and for activities involving other geologic units in any areas where the PRS considers it warranted based on the results of the TR or field surveys. In all areas subject to monitoring, monitoring will initially be conducted full-time during all grading and excavation activities, but the PRMMP may provide for monitoring frequency in any given location to be reduced once 50% of the ground-disturbing activity in that location has been completed, if the reduction is appropriate based on the implementing PRS’s professional judgment in consideration of actual site conditions.
- If the PRS considers it warranted, monitoring will also be stipulated for construction drilling operations. In general, small diameter (i.e., <18 inches) drilling activities or drilling activities using bucket augers tend to pulverize impacted sediments and contained fossils and not typically monitored. The portion of the PRMMP monitoring program for drilling operations will be developed in conjunction with the CP design and geotechnical teams, in consideration of the nature, depth, and location of drilling needed, and the anticipated equipment and staging configurations.
- Provisions for the content and delivery of paleontological resources WEAP training.
- In-progress documentation of monitoring (and, if applicable, salvage/recovery operations) via “construction dailies” or a similar means.
- Provisions for a “stop work, evaluate, and treat appropriately” response in the event of a known or potential paleontological discovery, including finds in highly sensitive units as well as finds, if any, in units identified as less sensitive, or non-sensitive, for paleontological resources.

- Sampling and recovery procedures consistent with SVP *Standard Procedures* (SVP Impact Mitigation Guidelines Revision Committee 2010) and the SVP *Conditions of Receivership* (SVP Conformable Impact Mitigation Guidelines Committee 1996). Recovery procedures will provide for recovery of both macrofossils and microfossils.
- A repository agreement providing for appropriate curation of recovered materials, consistent with the SVP *Conditions of Receivership* (SVP Conformable Impact Mitigation Guidelines Committee 1996). If more than one repository institution is designated, separate repository agreements must be provided.
- Final report preparation procedures consistent with Caltrans *Standard Environmental Reference* Chapter 8 provisions for the Paleontological Monitoring Report and Paleontological Stewardship Summary (Caltrans 2014).
- Procedures for the preparation, identification, and analysis of fossil specimens and data recovered, consistent with the SVP *Conditions of Receivership* (SVP Conformable Impact Mitigation Guidelines Committee 1996) and any specific requirements of the designated repository institution(s).

GEO-IAMF #14: Provide WEAP Training for Paleontological Resources

Prior to groundbreaking for each CP within the Project Section, the Contractor will provide paleontological resources WEAP training delivered by the Supervising Paleontologist. All management and supervisory personnel and construction workers involved with ground-disturbing activities will be required to take this training before beginning work on the project. Refresher training will also be made available to management and supervisory personnel and workers as needed, based on the judgment of the PRS.

At a minimum, paleontological resources WEAP training will include information on:

- coordination between construction staff and paleontological staff
- construction and paleontological staff roles and responsibilities in implementing the PRMMP
- the possibility of encountering fossils during construction
- the types of fossils that may be seen and how to recognize them
- proper procedures in the event fossils are encountered, including the requirement to halt work in the vicinity of the find and procedures for notifying responsible parties in the event of a find.

Training materials and formats may include, but are not necessarily limited to, in-person training, prerecorded videos, posters, and informational brochures that provide contacts and summarize procedures in the event paleontological resources are encountered. WEAP training contents will be subject to review and approval by the Authority. Paleontological resources WEAP training may be provided concurrently with cultural resources WEAP training.

Upon completion of any WEAP training, the Contractor will require workers to sign a form stating that they attended the training and understand and will comply with the information presented. Verification of paleontological resources WEAP training will be provided to the Authority by the Contractor.

GEO-IAMF#15: Halt Construction, Evaluate, and Treat if Paleontological Resources Are Found

If known or potential fossil materials are discovered during construction, regardless of the individual making a paleontological discovery, all activity in the immediate vicinity of the discovery will halt and the find will be protected from further disturbance. If the discovery is made by someone other than the PRS or qualified paleontological monitor, the person who made the discovery will immediately notify construction supervisory personnel, who will notify the PRS. Notification to the PRS will take place promptly (prior to the close of work the same day as the

find), and the PRS will evaluate the find and prescribe appropriate treatment as soon as feasible. Work may continue on other parts of the site while evaluation (and, if needed, treatment) takes place, as long as the find can be adequately protected in the judgment of the PRS.

If the PRS determines that treatment is warranted, such treatment, and any required reporting, will proceed consistent with the PRMMP. The Contractor will be responsible for ensuring prompt and accurate implementation, subject to verification by the Authority.

The stop work requirement does not apply to drilling since drilling typically cannot be suspended in mid-course. However, if finds are made during drilling, the same notification and other follow-up requirements will apply. The PRS will coordinate with construction supervisory and drilling staff regarding the handling of recovered materials.

The requirements of this IAMF will be detailed in the PRMMP and presented as part of the paleontological resources WEAP training.

Hazardous Materials and Waste

HMW-IAMF#1: Property Acquisition Phase 1 and Phase 2 Environmental Site Assessments

During the right-of-way acquisition phase, Phase 1 environmental site assessments (ESA) shall be conducted in accordance with standard ASTM methodologies to characterize each parcel. The determination of parcels that require a Phase 2 ESA (e.g., soil, groundwater, soil vapor subsurface investigations) will be informed by a Phase 1 ESA and may require coordination with state and local agency officials. If the Phase 2 ESA concludes that the site is impacted, remediation or corrective action (e.g., removal of contamination, in-situ treatment, or soil capping) will be conducted with state and local agency officials (as necessary) and in full compliance with applicable state and federal laws and regulations.

HMW-IAMF#2: Landfill

Prior to Construction (any ground disturbing activities), the Contractor shall verify to the Authority through preparation of a technical memorandum that methane protection measures will be implemented for all work within 1,000 feet of a landfill, including gas detection systems and personnel training. This will be undertaken pursuant to State of California Title 27, Environmental Protection – Division 2, Solid Waste, and the hazardous materials best management practices plan.

HMW-IAMF#3: Work Barriers

Prior to Construction (any ground disturbing activities), the Contractor shall verify to the Authority through preparation of a technical memorandum the use of work barriers. Nominal design variances, such as the addition of a plastic barrier beneath the ballast material to limit the potential release of volatile subsurface contaminants, may be implemented in conjunction with site investigation and remediation.

HMW-IAMF#4: Undocumented Contamination

Prior to Construction, the Contractor shall prepare a CMP addressing provisions for the disturbance of undocumented contamination. The plan will be submitted to the Authority for review and approval. Undocumented contamination could be encountered during construction activities and the Contractor will work closely with local agencies to resolve any such encounters and address necessary clean-up or disposal. Copies of all required hazardous material documentation shall be provided within 30 days to the Authority.

HMW-IAMF#5: Demolition Plans

Prior to Construction that involves demolition, the Contractor shall prepare demolition plans for the safe dismantling and removal of building components and debris. The demolition plans will include a plan for lead and asbestos abatement. The plans shall be submitted to the Project Construction Manager (PCM) on behalf of the Authority for verification that appropriate demolition

practices have been followed consistent with federal and state regulations regarding asbestos and lead paint abatement.

HMW-IAMF#6: Spill Prevention

Prior to Construction (any ground disturbing activities), the Contractor shall prepare a Construction Management Plan addressing spill prevention. A Spill Prevention, Control, and Countermeasure (SPCC) plan (or Soil Prevention and Response Plan if the total above-ground oil storage capacity is less than 1,320 gallons in storage containers greater than or equal to 55-gallons) shall prescribe BMPs to follow to prevent hazardous material releases and clean-up of any hazardous material releases that may occur. The plans will be prepared and submitted to the PCM on behalf of the Authority and shall be implemented during Construction.

HMW-IAMF#7: Transport of Materials

During Construction, the Contractor will comply with applicable state and federal regulations, such as the Resource Conservation and Recovery Act (RCRA), Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), the Hazardous Materials Release Response Plans and Inventory Law, and the Hazardous Waste Control Act. Prior to Construction the Contractor will provide the Authority with a hazardous materials and waste plan describing responsible parties and procedures for hazardous waste and hazardous materials transport.

HMW-IAMF#8: Permit Conditions

During Construction the Contractor will comply with the State Water Resources Control Board Construction Clean Water Act Section 402 General Permit conditions and requirements for transport, labeling, containment, cover, and other BMPs for storage of hazardous materials during construction. Prior to Construction, the Contractor shall provide the Authority with a hazardous materials and waste plan describing responsible parties and procedures for hazardous waste and hazardous materials transport, containment, and storage BMPs that will be implemented during Construction.

HMW-IAMF#9: Environmental Management System

To the extent feasible, the Authority is committed to identifying, avoiding, and minimizing hazardous substances in the material selection process for construction, operation, and maintenance of the HSR System. The Authority will use an Environmental Management System to describe the process that will be used to evaluate the full inventory of hazardous materials as defined by federal and state law employed on an annual basis and will replace hazardous substances with nonhazardous materials. The Contractor shall implement the material substitution recommendation contained in the annual inventory.

HMW-IAMF#10 Hazardous Materials Plans

Prior to Operations and Maintenance activities, the Authority shall prepare hazardous materials monitoring plans. These will use as a basis source, such as a hazardous materials business plan as defined in Title 19 California Code of Regulations and a SPCC plan.

Hydrology and Water Resources

HYD-IAMF#1: Storm Water Management

Prior to Construction, the Contractor shall prepare a storm water management and treatment plan for review and approval by the Authority. During the detailed design phase, each receiving stormwater system's capacity to accommodate project runoff will be evaluated. As necessary, on-site stormwater management measures, such as detention or selected upgrades to the receiving system, will be designed to provide adequate capacity and to comply with the design standards in the latest version of Authority Technical Memorandum *2.6.5 Hydraulics and Hydrology Guidelines*. On-site stormwater management facilities will be designed and constructed to capture runoff and provide treatment prior to discharge of pollutant-generating surfaces, including station parking areas, access roads, new road over- and underpasses, reconstructed interchanges, and

new or relocated roads and highways. Low-impact development techniques will be used to detain runoff on site and to reduce off site runoff such as constructed wetland systems, biofiltration and bioretention systems, wet ponds, organic mulch layers, planting soil beds, and vegetated systems (biofilters), such as vegetated swales and grass filter strips, will be used where appropriate.

HYD-IAMF#2: Flood Protection

Prior to Construction, the Contractor shall prepare a flood protection plan for Authority review and approval. The project will be designed both to remain operational during flood events and to minimize increases in 100-year or 200-year flood elevations, as applicable to locale. Design standards will include the following:

- Establish track elevation to prevent saturation and infiltration of stormwater into the sub-ballast.
- Minimize development within the floodplain, to such an extent that water surface elevation in the floodplain will not increase by more than 1 foot, or as required by state or local agencies, during the 100-year or 200-year flood flow [as applicable to locale]. Avoid placement of facilities in the floodplain or raise the ground with fill above the base-flood elevation.
- Design the floodplain crossings to maintain a 100-year floodwater surface elevation of no greater than 1 foot above current levels, or as required by state or local agencies, and project features within the floodway itself will not increase existing 100-year floodwater surface elevations in Federal Emergency Management Agency-designated floodways, or as otherwise agreed upon with the county floodplains manager.

The following design standards will minimize the effects of pier placement on floodplains and floodways:

- Design site crossings to be as nearly perpendicular to the channel as feasible to minimize bridge length.
- Orient piers to be parallel to the expected high-water flow direction to minimize flow disturbance.
- Elevate bridge crossings at least 3 feet above the high-water surface elevation to provide adequate clearance for floating debris, or as required by local agencies.
- Conduct engineering analyses of channel scour depths at each crossing to evaluate the depth for burying the bridge piers and abutments. Implement scour-control measures to reduce erosion potential.
- Use quarry stone, cobblestone, or their equivalent for erosion control along rivers and streams, complimented with native riparian plantings or other natural stabilization alternatives that will restore and maintain a natural riparian corridor.
- Place bedding materials under the stone protection at locations where the underlying soils require stabilization as a result of stream-flow velocity.

HYD-IAMF#3: Prepare and Implement a Construction Stormwater Pollution Prevention Plan

Prior to Construction (any ground disturbing activities), the Contractor shall comply with the State Water Resources Control Board (SWRCB) Construction General Permit requiring preparation and implementation of a SWPPP. The Construction SWPPP will propose BMPs to minimize potential short-term increases in sediment transport caused by construction, including erosion control requirements, stormwater management, and channel dewatering for affected stream crossings. These BMPs will include measures to incorporate permeable surfaces into facility design plans where feasible, and how treated stormwater will be retained or detained on site. Other BMPs shall include strategies to manage the amount and quality of overall stormwater runoff. The Construction SWPPP will include measures to address, but will not be limited to, the following:

- Hydromodification management to verify maintenance of pre-project hydrology by emphasizing on site retention of stormwater runoff using measures such as flow dispersion, infiltration, and evaporation (supplemented by detention where required). Additional flow control measures will be implemented where local regulations or drainage requirements dictate.
- Implementing practices to minimize the contact of construction materials, equipment, and maintenance supplies with stormwater.
- Limiting fueling and other activities using hazardous materials to areas distant from surface water, providing drip pans under equipment, and daily checks for vehicle condition.
- Implementing practices to reduce erosion of exposed soil, including soil stabilization, regular watering for dust control, perimeter siltation fences, and sediment catchment basins.
- Implementing practices to maintain current water quality, including: siltation fencing, wattle barriers, stabilized construction entrances, grass buffer strips, ponding areas, organic mulch layers, inlet protection, storage tanks and sediment traps to arrest and settle sediment.
- Where feasible, avoiding areas that may have substantial erosion risk, including areas with erosive soils and steep slopes.
- Using diversion ditches to intercept surface runoff from off site.
- Where feasible, limiting construction to dry periods when flows in water bodies are low or absent.
- Implementing practices to capture and provide proper off-site disposal of concrete wash water, including isolation of runoff from fresh concrete during curing to prevent it from reaching the local drainage system, and possible treatments (e.g., dry ice).
- Developing and implementing a spill prevention and emergency response plan to handle potential fuel and/or hazardous material spills.

Implementation of a SWPPP will be performed by the construction contractor as directed by the contractor's Qualified SWPPP Practitioner or designee. As part of that responsibility, the effectiveness of construction BMPs must be monitored before, during and after storm events. Records of these inspections and monitoring results are submitted to the local regional water quality control board (RWQCB) as part of the annual report required by the Statewide Construction General Permit. The reports are available to the public online. The SWRCB and RWQCB will have the opportunity to review these documents.

HYD-IAMF#4: Prepare and Implement an Industrial Stormwater Pollution Prevention Plan

Prior to Construction of any facility classified as an industrial facility, the Contractor shall comply with existing water quality regulations. The stormwater general permit requires preparation of a SWPPP and a monitoring plan for industrial facilities that discharge stormwater from the site, including vehicle maintenance facilities associated with transportation operations. The permit includes performance standards for pollution control.

HYD-IAMF-#5: Tunnel Design Features and Construction Methods

The Contractor shall implement the following tunnel design features and construction methods to avoid and/or minimize the potential for groundwater depletion during tunnel construction and operation, and consequential potential for hydrologic changes that may affect groundwater and/or surface water resources in areas overlying the tunnel alignment. Two types of potential effects must be considered, (1) temporary effects that occur due to construction; and (2) permanent effects that could occur over the lifetime of the project.

Hydraulic conductivity of the subsurface strata is expected to be low along many parts of the Pacheco Pass tunnel alignments based on evaluation of the construction of previous tunnels

nearby and of the geological strata along the proposed tunnel alignment (Authority 2017b). However, certain sections of the tunneled alignments (e.g. fault zones, zones of highly fractured or sheared rock, or other pervious deposits) could exhibit higher hydraulic conductivity, higher rates of groundwater inflow into excavated opening(s) and higher water pressure(s) on tunnel's permanent structure (final liner). Subsurface conditions for the Pacheco tunnels could include groundwater pressures up to 435 psi (Authority 2017b).[2]

The amount of groundwater depletion will depend upon the geotechnical and hydrogeological conditions along the tunnel alignment, the tunnel construction methods utilized, and design features that will minimize such inflows. Temporary inflows into the tunnel and groundwater flow around the outside of the tunnel (annular flow) during construction are likely unavoidable Thus, temporary effects to surface and groundwater conditions are possible even with implementation of this IAMF. Methods implemented to control potential effects will depend on the consequences and nature of the anticipated effects.

The tunnels at Pacheco Pass could be constructed using tunnel boring machine (TBM) tunneling methods or conventional mined tunnel methods such as the sequential excavation method (SEM). Cross passages will most likely be constructed using a conventional mining approach. The table below summarizes the potential for temporary and permanent groundwater effects for the two primary tunneling methods. It should be recognized that potential for groundwater effects also depends on geologic and groundwater conditions as well.

Tunneling Method	Potential for Temporary Groundwater Depletion	Potential for Permanent Groundwater Depletion	Comments
TBM Methods	Low, as inflows typically occur at or close to the tunnel face and are controlled via TBM design that allows watertight construction and may include special measures applied from the TBM or from the surface to lower potential for groundwater inflows into the tunnel	Very low especially with the provision of a watertight lining. Also, grouting around precast segmental liner will lower potential for directional groundwater depletion due to annular flows along the tunnel alignment	Generally, TBM tunnels will have a one-pass precast concrete segmental lining designed to be watertight
Conventional Mining or SEM Methods	Can be higher; inflows along the entire tunnel alignment can be controlled by special measures until final lining is installed	Very low since a watertight lining is usually provided	Initial lining installed using this approach is usually not a watertight lining. Special measures (grouting) can control higher inflows during sequential excavation and initial liner construction. Drainage system may be provided to reduce hydrostatic pressures on final lining; however, such system is usually not practical in long tunnels due to requirement for continuous maintenance measures of the drainage system components (cleanouts, piping).

Tunnel Design to Avoid Permanent Groundwater Depletion

[2] California High Speed Rail Authority. 2017b. Conceptual Tunnel Design and Constructability Considerations for Pacheco Pass – Draft PEPD. Project Section: San Jose to Central Valley Wye. May.

Tunnels shall be designed to be watertight, smooth, durable, and low maintenance to generally maintain existing groundwater levels over the tunnel structures throughout the tunnel design service life. Tunnel lining shall consist of one- or two-pass lining systems to meet HSR design criteria requirements.

TBM Methods - One-pass tunnel lining construction entails the installation of a precast concrete segmental lining with gaskets at each segment joint to construct an essentially watertight tunnel lining. The segmental lining is installed from within the shield at the rear of a TBM. A dual system of gaskets can be utilized to increase safety factors for resisting water pressures and arrest groundwater intrusion into the final tunnel structure. The feasibility for watertight linings are generally limited to magnitudes of water pressure less than 40 bars (580 psi)[3].

A two-pass tunnel lining system involves two stages of construction and will be used in tunnels where groundwater pressures exceed the capacity of state-of-the-art one-pass linings available at the time of project construction. During the first stage of construction, an initial ground support system (e.g. precast segmental lining for a TBM tunnel) will be erected during the excavation cycle to maintain stability of the excavated opening, minimize water inflows and protect workers. During the second stage, a watertight membrane together with a cast-in-place concrete liner will be installed as the final component and permanent support of a two-pass lining system. This two-pass lining approach has been used in long, high-speed rail tunnel projects with high ground water pressures, such as in tunnels in the Lyon-Turin line, the Gotthard Base Tunnel (Switzerland), and the Vienna-St. Pölten Railway Line (Austria).

Conventional Tunneling Methods – Conventional tunneling methods using drill and blast or mechanical excavation will also be designed to be undrained and watertight to arrest or minimize potential groundwater depletion effects. The initial concrete linings used for temporary excavation support will likely consist of sprayed shotcrete, reinforced or unreinforced, and may be preceded by implementation of grouting measures that may control groundwater inflows during excavation. Following application of initial shotcrete support and prior to installation of permanent (final) lining, a waterproofing membrane will be installed. Often ‘compartmentalization’ of waterproofing membrane is implemented, including grouting hoses, to allow local repairs to be made later in case groundwater leakage is identified in course of the liner service life. The shape and size of the tunnel cross section of a conventionally mined tunnel will be designed and adjusted to accommodate ground conditions, including potentially high groundwater pressures.

The specific tunnel lining type will be determined during final design, informed by Phase 2 geotechnical investigations proximate to the tunnel alignment. The Contractor shall utilize state-of-the-art technology available to ensure that potential groundwater depletion is avoided or minimized to the greatest degree practicable.

Construction Methods to Minimize Temporary Groundwater Depletion

The following construction methods shall be employed to avoid and minimize temporary groundwater depletion due to tunnel construction.

TBM Methods - TBM requirements shall include:

- Capability to control potential water inflows by using a closed-face, shielded TBM including special shield provisions (multiple brush system with inflatable seals) to maintain waterproofed excavation on a temporary basis prior to segmental liner installation;
- Capability of systematic probe drilling, monitoring of water inflows, and pre-excavation grouting and backfilling with two-component grout. Grouting requirements include providing adequate backfill grouting, monitoring grout volumes, and using appropriate grout mixes to prevent grout washout; these measures will improve watertight performance of tunnel linings; and

[3] See discussion of Hallandsas Tunnel and Arrowhead Tunnels in Authority (2017a).

- Check-grouting through dedicated sockets in precast segmental liner to completely fill the annular opening due to TBM over-excavation, between the segments and the ground.

Pre-excavation grouting can be performed from the TBM, provided the TBM is delivered with built-in capability, including grout ports through the TBM cutter-head and through the shield, and set-up for concurrent drilling and grouting of multiple holes. For predominantly non-cohesive soils, or cohesive soils, Slurry TBMs or Earth Pressure Balance (EPB) TBMs, respectively, as well as variable density TBMs, use pressurized tunnel face and pressurized tunnel perimeter around the tunnel shield to counterbalance external earth and groundwater pressures to minimize groundwater inflow during tunnel construction and work in concert with special layered shield brush-system with inflatable seals, to assure shield water-tightness during the tunnel excavation.[4]

Conventional Tunneling Methods – Conventional tunneling methods require access to the open face of the tunnel are limited to ground which can remain stable during excavation. In very hard rock, drill and shoot methods are required. In medium to soft rock, a road header can be employed and in stiff clay and soil an excavator can be used. Conventional tunneling is a very flexible method and can adapt to varying ground conditions and changing geometry. Support type and excavation methods can be adapted to meet the ground conditions including the ability to vary the support types, size of opening, ring closure time and the excavation technique as well as other factors. Tunneling can be done full face or in several drifts and benches. Typically, the cyclic steps of excavation included loosening and removing material in short sets of 3 feet to 10 feet before placing support measures. The freshly exposed ground must remain stable long enough to allow workers time to put initial support measures such as dowels, mesh, shotcrete, and lattice girders in place. The face and sides of the tunnel are exposed during the time between excavation and placement of support. For this reason, conventional tunneling methods are limited to stiff soil or rock. Construction below the water table in fractured rock or highly permeable ground such as sand, requires ground modification measures such as grouting or ground freezing in advance of excavation. Such measures are usually employed for short stretches of tunnel or adits but generally are cost prohibitive for long tunnels where use of a TBM is much more economical.

In conventional mined tunnel segments and cross passages, the Contractor shall use pre-excavating grouting techniques as the preliminary primary method of groundwater control to lower ground permeability and minimize or arrest ground water inflow into the excavated openings, prior to excavation of cross passages and other underground structures. Pre-excavation grouting will be adjusted as necessary to control ground water inflows. Pre-excavation grouting for conventionally mined tunnels will be carried out within the tunnel by face grouting or radial grouting. Ground improvement measures such as jet grouting and ground freezing, as applicable to specific ground conditions, are other methods which may be used to stabilize the excavation and seal off water during construction. As tunnel inflows may become mixed with construction materials such as concrete and grout that could otherwise affect water quality, tunnel inflows will be collected and pre-treated prior to any discharge into surface water or groundwater as necessary to maintain baseline water quality.

Monitoring and Remedial Action

Hydrogeologic information from pre-construction subsurface investigations will be used to model existing hydrogeologic features and evaluate potential effects of tunneling on the local groundwater regime. Based on assessment of existing conditions and anticipated effects of construction to groundwater regime, the contractor will identify the specific methods (based on the methods described above) to minimize construction effects to the existing groundwater regime and suggest refined tunnel excavation methods and/or design to minimize or eliminate the risk and likelihood of impacts to groundwater.

[4] State-of-the-art of slurry and EPB technology limits maximum pressure to approximately 17 bars/247 psi (570 feet of hydrostatic pressure). These TBM's can be utilized where feasible.

In order to check that these approaches are performing as anticipated, a groundwater instrumentation and monitoring program will be implemented. Prior to any disturbance of the groundwater regime by construction or pre-construction activities, baseline groundwater and surface water conditions will be established by systematic monitoring for a period of at least three years. Baseline monitoring shall include measurements of groundwater levels and groundwater quality as well as measurements of flow rates and hydroperiod of surface water features including creeks and ponds and precipitation.

During tunnel construction and operation, monitoring of groundwater conditions shall consist of systematic observation, measurement, and reporting of changes in 1) water levels in monitoring wells and existing water supply wells; 2) conditions at local springs and surface water bodies; 3) groundwater and surface water chemistry; and 4) quantity and quality of groundwater inflows to the tunnel.

Should unanticipated groundwater inflows be such that excavation by conventional tunneling methods is only possible with dewatering, design of dewatering measures shall specify horizontal and vertical limits on lowering of the groundwater table. Controlled dewatering, if necessary, could be accomplished by vertical or horizontal wells or vacuum drains and could be done from the ground surface or from within the tunnel. If monitoring and modeling indicate that water levels outside of the immediate vicinity of the tunnel could be affected, a simultaneous pumping and recharge system could be used to maintain existing water levels away from the immediate vicinity of the tunnel.

Following initial construction of the tunnel, if groundwater inflow and/or annular flow around the completed tunnel indicates substantial ongoing groundwater depletion, then remedial action, primarily consisting of additional grouting into void spaces around the tunnel exterior and/or other appropriate actions shall be employed.

Land Use, Development, and Station Planning

LU-IAMF#1: HSR Station Area Development: General Principles and Guidelines

Prior to Operation and Maintenance, the Authority shall prepare a memorandum for each station describing how the Authority's station area development principles and guidelines are applied to achieve the anticipated benefits of station area development. Refer to HSR Station Area Development General Principles and Guidelines, February 3, 2011.

LU-IAMF#2: Station Area Planning and Local Agency Coordination

Prior to Operation and Maintenance, the Authority shall prepare a memorandum for each station describing the local agency coordination and station area planning conducted to prepare the station area for HSR operations. Refer to HSR Station Area Development: General Principles and Guidelines, February 3, 2011.

LU-IAMF#3: Restoration of Land Used Temporarily During Construction

Prior to any ground disturbing activities at the site of land to be used temporarily during construction, the Contractor shall prepare a restoration plan addressing specific actions, sequence of implementation, parties responsible for implementation and successful achievement of restoration for temporary impacts. Before beginning construction use of land, the Contractor shall submit the restoration plan to the Authority for review and obtain Authority approval. The restoration plan shall include time-stamped photo documentation of the pre-construction conditions of all temporary staging areas. All construction access, mobilization, material laydown, and staging areas will be returned to a condition equal to the pre-construction staging condition. This requirement is included in the design-build construction contract requirements.

Noise and Vibration

NV-IAMF#1: Noise and Vibration

Prior to Construction, the Contractor shall prepare and submit to the Authority a noise and vibration technical memorandum documenting how the FTA and FRA guidelines for minimizing construction noise and vibration impacts will be employed when work is being conducted within 1,000 feet of sensitive receptors. Typical construction practices contained in the FTA and FRA guidelines for minimizing construction noise and vibration impacts include the following:

- Construct noise barriers, such as temporary walls or piles on excavated material, between noisy activities and noise sensitive resources.
- Route truck traffic away from residential streets, when possible.
- Construct walled enclosures around especially noisy activities or around clusters or noise equipment.
- Combine noisy operations so that they occur in the same period.
- Phase demolition, earthmoving, and ground impacting operations so as not to occur in the same time period.
- Avoid impact pile driving where possible in vibration sensitive areas.

Parks, Recreation, and Open Space

PK-IAMF#1: Parks, Recreation, and Open Space

Prior to Construction, the Contractor shall prepare and submit to the Authority a technical memorandum that identifies project design features to be implemented to minimize impacts on parks, recreation and open space. Typical design measures to avoid or minimize impacts to parks and recreation may include:

- Provide safe and attractive access for present travel modes (e.g., motorists, bicyclists, pedestrians—as applicable) to existing park and recreation facilities.
- Design guideway, system, and station features in such a way as to enhance the surrounding local communities. Provide easy crossings of the guideway which allows for community use under the guideway or at station areas.

Public Utilities and Energy

PUE-IAMF#1: Design Measures

The HSR project design incorporates utilities and design elements that minimize electricity consumption (e.g., using regenerative braking, energy-saving equipment on rolling stock and at station facilities, implementing energy saving measures during construction, and automatic train operations to maximize energy efficiency during operations). Thus, the project will not overburden utility services. The design elements are included in the design build contract. Additionally, the Authority has adopted a sustainability policy that establishes project design and construction requirements that avoid and minimize impacts.

PUE-IAMF#2: Irrigation Facility Relocation

Where relocating an irrigation facility is necessary, the Contractor will verify the new facility is operational prior to disconnecting the original facility, where feasible. Irrigation facility relocation preferences are included in the design-build contract and reduce unnecessary impacts to continued operation of irrigation facilities. The Contractor shall document all relocations in a memorandum for Authority review and approval.

PUE-IAMF#3: Public Notifications

Prior to Construction in areas where utility service interruptions are unavoidable, the Contractor will notify the public through a combination of communication media (e.g., by phone, email, mail, newspaper notices, or other means) within that jurisdiction and the affected service providers of the planned outage. The notification will specify the estimated duration of the planned outage and will be published no less than 7 days prior to the outage. Construction will be coordinated to avoid interruptions of utility service to hospitals and other critical users. The Contractor will submit the public communication plan to the Authority 60 days in advance of the work for verification that appropriate messaging and notification are to be provided.

PUE-IAMF#4: Utilities and Energy

Prior to Construction, the Contractor shall prepare a technical memorandum documenting how construction activities will be coordinated with service providers to minimize or avoid interruptions. It will include upgrades of existing power lines to connect the HSR System to existing utility substations. The technical memorandum shall be provided to the Authority for review and approval.

Safety and Security

SS-IAMF#1: Construction Safety Transportation Management Plan

Prior to Construction (any ground disturbing activity), the Contractor shall prepare for submittal to the Authority a construction safety transportation management plan. The plan will describe the contractor's coordination efforts with local jurisdictions for maintaining emergency vehicle access. The plan will also specify the Contractors procedures for implementing temporary road closures including: access to residences and businesses during construction, lane closures, signage and flag persons, temporary detour provisions, alternative bus and delivery routes, emergency vehicle access, and alternative access locations. The Contractor shall prepare and submit monthly reports to the Authority documenting construction transportation plan implementation activities for compliance monitoring.

SS-IAMF#2: Safety and Security Management Plan

Sixty days after receiving from the Authority a construction notice-to-proceed, the Contractor shall provide the Authority with a technical memorandum documenting how the following requirements, plan, programs and guidelines were considered in design, construction and eventual operation to protect the safety and security of construction workers and users of the HSR. The Contractor shall be responsible for implementing all construction-related safety and security plans and the Authority shall be responsible for implementing all safety and security plans related to HSR operation.

- Workplace worker safety is generally governed by the Occupational Health and Safety Act of 1970, which established the OSHA. OSHA establishes standards and oversees compliance with workplace safety and reporting of injuries and illnesses of employed workers. In California, OSHA enforcement of workplace requirements is performed by California Occupational Safety and Health Administration (Cal OSHA). Under Cal OSHA regulations, as of July 1, 1991, every employer must establish, implement, and maintain an injury and illness prevention program.
- The Authority has adopted a Safety and Security Management Plan to guide the safety and security activities, processes, and responsibilities during design, construction and implementation phases of the project to protect the safety and security of construction workers and the public. A Systems Safety Program Plan (SSPP) and a System Security Plan will be implemented prior to the start of revenue service to guide the safety and security of the operation of the high-speed rail system.

- Prior to Construction, the Contractor shall provide the Authority with a Safety and Security Management Plan documenting how they will implement the Authority's safety and security requirements within their project scope.
- Implement site-specific health and safety plans and site-specific security plans to establish minimum safety and security guidelines for contractors of, and visitors to, construction projects. Contractors will be required to develop and implement site-specific measures that address regulatory requirements to protect human health and property at construction sites.
- Preparation of a Valley Fever action plan that includes: A) information on causes, preventative measures, symptoms, and treatments for Valley Fever to individuals who could potentially be exposed through construction activities (i.e., construction workers, monitors, managers, and support personnel); B) continued outreach and coordination with California Department of Public Health; C) coordination with county departments of public health to ensure that the above referenced information concerning Valley Fever is readily available to nearby residents, schools, and businesses and to obtain area information about Valley Fever outbreaks and hotspots; and D) provide a qualified person dedicated to overseeing implementation of the Valley Fever prevention measures to encourage a culture of safety of the contractors and subcontractors. The Valley Fever Health and Safety (VFHS) designee shall coordinate with the county Public Health Officer and oversee and manage the implementation of Valley Fever control measures. The VFHS designee is responsible for ensuring the implementation of measures in coordination with the county Public Health Officer. Medical information will be maintained following applicable and appropriate confidentiality protections. The VFHS in coordination with the county Public Health Officer will determine what measures will be added to the requirements for the Safety and Security Management Plan regarding preventive measures to avoid Valley Fever exposure. Measures shall include, but are not limited to the following: A) train workers and supervisors on how to recognize symptoms of illness and ways to minimize exposure, such as washing hands at the end of shifts; B) provide washing facilities nearby for washing at the end of shifts; C) provide vehicles with enclosed, air conditioned cabs and make sure workers keep the windows closed; D) equip heavy equipment cabs with high efficiency particulate air (HEPA) filters; and E) make NIOSH approved respiratory protection with particulate filters as recommended by the CDPH available to workers who request them.
- System safety program plans incorporate FRA requirements and are implemented upon FRA approval. FRA's SSPPs requirements will be determined in FRA's new System Safety Regulation (49 CFR 270).
- Rail systems must comply with FRA requirements for tracks, equipment, railroad operating rules and practices, passenger safety, emergency response, and passenger equipment safety standards found in 49 CFR Parts 200-299.
- The HSR *Urban Design Guidelines* (Authority 2011) require implementing the principles of crime prevention through environmental design. The contractor shall consider four basic principles of crime prevention through environmental design during station design and site planning: territoriality (design physical elements that express ownership of the station or site); natural surveillance (arrange physical features to maximize visibility); improved sightlines (provide clear views of surrounding areas); and access control (provide physical guidance for people coming and going from a space). The HSR design includes emergency access to the rail right-of-way, and elevated HSR structure design includes emergency egress points.
- Implement fire/life safety and security programs that promote fire and life safety and security in system design, construction, and implementation. The fire and life safety program is coordinated with local emergency response organizations to provide them with an understanding of the rail system, facilities, and operations, and to obtain their input for modifications to emergency response operations and facilities, such as evacuation routes. The Authority will establish fire/life safety and security committees throughout the HSR section.

- Implement system security plans that address design features intended to maintain security at the stations within the track right-of-way, at stations, and onboard trains. A dedicated police force will ensure that the security needs of the HSR system are met.
- The design standards and guidelines require emergency walkways on both sides of the tracks for both elevated and at-grade sections and the provision of appropriate space as defined by fire and safety codes along at-grade sections of the alignment to allow for emergency response access.
- Implement standard operating procedures and emergency operating procedures, such as the FRA-mandated Roadway Worker Protection Program to address the day-to-day operation and emergency situations that will maintain the safety of employees, passengers, and the public.

SS-IAMF#3: Hazard Analyses

The Authority's hazard management program includes the identification of hazards, assessment of associated risk, and application of control measures (mitigation), to reduce the risk to an acceptable level. Hazard assessment includes a preliminary hazard analysis (PHA) and threat and vulnerability assessment (TVA).

- The Authority's programmatic PHAs are developed in conformance with the FRA's *Collison Hazard Analysis Guide: Commuter and Intercity Passenger Service* (FRA 2007) and the U.S. Department of Defense's System Safety Program Plan (MIL-STD-882) to identify and determine the facility hazards and vulnerabilities so that they can be addressed by—and either eliminated or minimized—the design.
- TVAs establish provisions for the deterrence and detection of, as well as the response to, criminal and terrorist acts for rail facilities and system operations. Provisions include right-of-way fencing, intrusion detection, security lighting, security procedures and training, and closed-circuit televisions. Intrusion-detection technology could also alert to the presence of inert objects, such as toppled tall structures or derailed freight trains, and stop HSR operations to avoid collisions.
- During design and construction, the Contractor will conduct site-specific PHA and TVA assessments to apply the programmatic work to their specific project designs.

The Authority's safety and security committees will be responsible for implementing the recommendations contained in the hazard analysis during HSR operation.

SS-IAMF#4: Oil and Gas Wells

Prior to ground disturbing activities, the Contractor shall identify and inspect all active and abandoned oil and gas wells within 200 feet of the HSR tracks. Any active wells will be abandoned and relocated by the Contractor in accordance with the California Department of Conservation, Division of Oil, and Gas and Geothermal Resources (DOGGR) standards in coordination with the well owners. In the event that relocated wells do not attain the current production rates of the now-abandoned active wells, the Authority will be responsible for compensating the well owner for lost production. All abandoned wells within 200 feet of the HS tracks will be inspected and re-abandoned, as necessary, in accordance with DOGGR standards and in coordination with the well owner. The Contractor will provide the Authority with documentation that the identification and inspection of the wells has occurred prior to construction.

Socioeconomics and Communities

SOCIO-IAMF#1: Construction Management Plan

Prior to Construction, the Contractor shall prepare a CMP providing measures that minimize impacts on low-income households and minority populations. The plan shall be submitted to the Authority for review and approval. The plan will include actions pertaining to communications, visual protection, air quality, safety controls, noise controls, and traffic controls to minimize

impacts on low-income households and minority populations. The plan will verify that property access is maintained for local businesses, residences, and emergency services. This plan will include maintaining customer and vendor access to local businesses throughout construction by using signs to instruct customers about access to businesses during construction. In addition, the plan will include efforts to consult with local transit providers to minimize impacts on local and regional bus routes in affected communities.

SOCIO-IAMF#2: Compliance with Uniform Relocation Assistance and Real Property Acquisition Policies Act.

The Authority must comply with the Uniform Relocation Assistance and Real Property Acquisition Policies Act, as amended (Uniform Act). The provisions of the Uniform Act, a federally mandated program, will apply to all acquisitions of real property or displacements of persons resulting from this federally assisted project. It was created to provide for fair and equitable treatment of all affected persons. Additionally, the Fifth Amendment of the U.S. Constitution provides that private property may not be taken for a public use without payment of "just compensation."

The Uniform Act requires that the owning agency provide notification to all affected property owners of the agency's intent to acquire an interest in their property. This notification includes a written offer letter of just compensation. A right-of-way specialist is assigned to each property owner to assist him or her through the acquisition process. The Uniform Act also provides benefits to displaced individuals to assist them financially and with advisory services related to relocating their residence or business operation. Benefits are available to both owner occupants and tenants of either residential or business properties.

The Uniform Act requires provision of relocation benefits to all eligible persons regardless of race, color, religion, sex, or national origin. Benefits to which eligible owners or tenants may be entitled are determined on an individual basis and explained in detail by an assigned right-of-way specialist.

The California Relocation Assistance Act essentially mirrors the Uniform Act and also provides for consistent and fair treatment of property owners. However, because the project will receive federal funding, the Uniform Act takes precedence. Owners of private property have federal and state constitutional guarantees that their property will not be acquired or damaged for public use unless owners first receive just compensation. Just compensation is measured by the "fair market value," where the property value is considered to be the highest price negotiated on the date of valuation. The value must be agreed upon by a seller who is willing, not obliged to sell, but under no particular or urgent necessity and by a buyer who is ready, willing, and able to buy but under no particular necessity. Both the owner and the buyer must deal with the other with the full knowledge of all the uses and purposes for which the property is reasonably adaptable and available (Code of Civil Procedure Section 1263.320a).

More detailed information about how the Authority plans to comply with the Uniform Act and the California Relocation Assistance Act is provided in the following three detailed relocation assistance documents modeled after Caltrans versions:

- *Your Rights and Benefits as a Displacee under the Uniform Relocation Assistance Program (Residential)*
- *Your Rights and Benefits as a Displacee under the Uniform Relocation Assistance Program (Mobile Home)*
- *Your Rights and Benefits as a Displaced Business, Farm, or Nonprofit Organization under the Uniform Relocation Assistance Program*

SOCIO-IAMF#3: Relocation Mitigation Plan

Before any acquisitions occur, the Authority will develop a relocation mitigation plan, in consultation with affected cities and counties and property owners. In addition to establishing a program to minimize the economic disruption related to relocation, the relocation mitigation plan will be written in a style that also enables it to be used as a public-information document.

The relocation mitigation plan will be designed to meet the following objectives:

- Provide affected property and business owners and tenants a high level of individualized assistance in situations when acquisition is necessary and the property owner desires to relocate the existing land use.
- Coordinate relocation activities with other agencies acquiring property resulting in displacements in the study area to provide for all displaced persons and businesses to receive fair and consistent relocation benefits.
- Make a best effort to minimize the permanent closure of businesses and non-profit agencies as a result of property acquisition.
- Within the limits established by law and regulation, minimize the economic disruption caused to property owners by relocation.
- In individual situations, where warranted, consider the cost of obtaining the entitlement permits necessary to relocate to a suitable location and take those costs into account when establishing the fair market value of the property.
- Provide those business owners who require complex permitting with regulatory compliance assistance.

The relocation mitigation plan will include the following components:

- A description of the appraisal, acquisition, and relocation process as well as a description of the activities of the appraisal and relocation specialists.
- A means of assigning appraisal and relocation staff to affected property owners, tenants, or other residents on an individual basis.
- Individualized assistance to affected property owners, tenants, or other residents in applying for funding, including research to summarize loans, grants, and federal aid available, and research areas for relocation.
- Creation of an ombudsman's position to act as a single point of contact for property owners, residents, and tenants with questions about the relocation process. The ombudsman will also act to address concerns about the relocation process as it applies to the individual situations of property owners, tenants, and other residents.

Transportation

TR-IAMF#1: Protection of Public Roadways during Construction

Prior to Construction, the Contractor shall provide a photographic survey documenting the condition of the public roadways along truck routes providing access to the proposed project site. The photographic survey shall be submitted for approval to the agency responsible for road maintenance and the Authority. The Contractor shall be responsible for the repair of any structural damage to public roadways caused by HSR construction or construction access, returning any damaged sections to the equivalent of their original pre HSR construction structural condition or better. The Contractor shall survey the condition of the public roadways along truck routes providing access to the proposed project site after construction is complete. The Contractor shall complete a before- and after-survey report and submit it to the Authority for review, indicating the location and extent of any damage.

TR-IAMF#2: Construction Transportation Plan

The design-build contractor shall prepare a detailed Construction Transportation Plan (CTP) for the purpose of minimizing the impact of construction and construction traffic on adjoining and nearby roadways in close consultation with the local jurisdiction having authority over the site. The Authority must review and approve the CTP before the Contractor commences any construction activities. This plan will address, in detail, the activities to be carried out in each

construction phase, with the requirement of maintaining traffic flow during peak travel periods. Such activities include, but are not limited to, the routing and scheduling of materials deliveries, materials staging and storage areas, construction employee arrival and departure schedules, employee parking locations, and temporary road closures, if any. The CTP will provide traffic controls pursuant to the *California Manual on Uniform Traffic Control Devices* sections on temporary traffic controls (Caltrans 2012) and will include a traffic control plan that includes, at a minimum, the following elements:

- Temporary signage to alert drivers and pedestrians to the construction zone.
- Flag persons or other methods of traffic control.
- Traffic speed limitations in the construction zone.
- Temporary road closures and provisions for alternative access during the closure.
- Detour provisions for temporary road closures—alternating one-way traffic will be considered as an alternative to temporary closures where practicable and where it will result in better traffic flow than a detour.
- Identified routes for construction traffic.
- Provisions for safe pedestrian and bicycle passage or convenient detour.
- Provisions to minimize access disruption to residents, businesses, customers, delivery vehicles, and buses to the extent practicable—where road closures are required during construction, limit to the hours that are least disruptive to access for the adjacent land uses.
- Provisions for farm equipment access.
- Provisions for 24-hour access by emergency vehicles.
- Safe vehicular and pedestrian access to local businesses and residences during construction. The plan will provide for scheduled transit access where construction will otherwise impede such access. Where an existing bus stop is within the work zone, the design-builder will provide a temporary bus stop at a safe and convenient location away from where construction is occurring in close coordination with the transit operator. Adequate measures will be taken to separate students and parents walking to and from the temporary bus stop from the construction zone.
- Advance notification to the local school district of construction activities and rigorously maintained traffic control at all school bus loading zones, to provide for the safety of schoolchildren. Review existing or planned Safe Routes to Schools with school districts and emergency responders to incorporate roadway modifications that maintain existing traffic patterns and fulfill response route and access needs during project construction and HSR operations.
- Identification and assessment of the potential safety risks of project construction to children, especially in areas where the project is located near homes, schools, day care centers, and parks.
- Promotion of child safety within and near the project area. For example, crossing guards could be provided in areas where construction activities are located near schools, day care centers, and parks.

CTPs will consider and account for the potential for overlapping construction projects.

TR-IAMF#3: Off-Street Parking for Construction-Related Vehicles

The Contractor shall identify adequate off-street parking for all construction-related vehicles throughout the construction period to minimize impacts to public on-street parking areas. If adequate parking cannot be provided on the construction sites, the Contractor shall designate a remote parking area and arrange for the use a shuttle bus to transfer construction workers to/from the job site. This measure shall be addressed in the CTP.

TR-IAMF#4: Maintenance of Pedestrian Access

The Contractor shall prepare specific construction management plans to address maintenance of pedestrian access during the construction period. Actions that limit pedestrian access will include, but not be limited to, sidewalk closures, bridge closures, crosswalk closures or pedestrian rerouting at intersections, placement of construction-related material within pedestrian pathways or sidewalks, and other actions that may affect the mobility or safety of pedestrians during the construction period. If sidewalks are maintained along the construction site frontage, provide covered walkways and fencing. The plan objective shall be to maintain pedestrian access where feasible (i.e., meeting design, safety, Americans with Disabilities Act (ADA) requirements). This measure shall be addressed in the CTP.

TR-IAMF#5: Maintenance of Bicycle Access

The Contractor shall prepare specific construction management plans to address maintenance of bicycle access during the construction period. Actions that limit bicycle access will include, but not be limited to, bike lane closures or narrowing, closure or narrowing of streets that are designated bike routes, bridge closures, placement of construction-related materials within designated bike lanes or along bike routes, and other actions that may affect the mobility or safety of bicyclists during the construction period. Maintain bicycle access where feasible (i.e., meeting design, safety, ADA requirements). This measure shall be addressed in the CTP.

TR–IAMF#6: Restriction on Construction Hours

The Contractor shall limit construction material deliveries between 7 a.m. and 9 a.m. and between 4 p.m. and 6 p.m. on weekdays to minimize impacts to traffic on roadways. The contractor shall limit the number of construction employees arriving or departing the site between the hours of 7 a.m. and 8:30 a.m. and 4:30 p.m. and 6 p.m. Areas where these restrictions will be implemented will be determined as part of the CTP. Based on Authority review of the CTP the restricted hours maybe altered due to local travel patterns.

TR-IAMF#7: Construction Truck Routes

The Contractor shall deliver all construction-related equipment and materials on the appropriate truck routes and shall prohibit heavy-construction vehicles from using alternative routes to get to the site. Truck routes will be established away from schools, day care centers, and residences, or along routes with the least impact if the Authority determines those areas are unavoidable. This measure shall be addressed in the CTP.

TR-IAMF#8: Construction during Special Events

The Contractor shall provide a mechanism to prevent roadway construction activities from reducing roadway capacity during major athletic events or other special events that substantially (10 percent or more) increase traffic on roadways affect by project construction. Mechanisms include the presence of police officers directing traffic, special-event parking, use of within-the-curb parking, or shoulder lanes for through-traffic and traffic cones. This measure shall be addressed in the CTP.

TR-IAMF#9: Protection of Freight and Passenger Rail during Construction.

The Contractor shall repair any structural damage to freight or public railways that may occur during the construction period, and return any damaged sections to their original structural condition. If necessary, during construction, a “shoofly” track will be constructed to allow existing train lines to bypass any areas closed for construction activities. Upon completion, tracks will be opened and repaired; or new mainline track will be constructed, and the “shoofly” will be removed. Contractor repair responsibility will be included in the design/build contract.

TR-IAMF#10: Off Peak Hour Employee Work Shift Changes at HMF *[as applicable to HMF-related sections or the HMF project]*

The Authority will time work shifts for the heavy maintenance facility (HMF) facilities so the shifts do not coincide with local peak hour travel period. When the HMF employees arrive and depart,

they will do so during a non-peak period for local traffic. As a result, the total volumes on the roads during shift changes will be less than the volumes that occur during the local peak periods.

TR-IAMF#11: Maintenance of Transit Access.

The Contractor shall prepare specific construction management plans to address maintenance of transit access during the construction period. Actions that limit transit access will include, but not be limited to, roadway lane closures or narrowing, closure or narrowing of streets that are designated transit routes, bus stop closures, bridge closures, placement of construction-related materials within designated transit lanes, bus stop or layover zones or along transit routes, and other actions that may affect the mobility or safety of bus transit during the construction period. Maintain transit access where feasible (i.e., meeting design, safety, ADA requirements). This measure shall be addressed in the CTP.

TR-IAMF#12: Pedestrian and Bicycle Safety

Prior to construction, the Contractor shall provide a technical memorandum describing how pedestrian and bicycle accessibility will be provided and supported across the HSR corridor, to and from stations and on station property. Priority of safety for pedestrians and bicycles and vulnerable populations over motor vehicle access will be done in a way so as to encourage maximum potential access from non-motorized modes. Local access programs, such as Safe Routes to Schools, shall be maintained or enhanced. Access to community facilities for vulnerable populations shall be maintained or enhanced.

APPENDIX 2-F: PG&E NETWORK UPGRADES

APPENDIX 2-F: PG&E NETWORK UPGRADES

Introduction

Connecting the HSR system to the statewide electrical grid would require upgrades to existing Pacific Gas and Electric Company (PG&E) network facilities to serve the increased electrical load during operation.

Network Upgrades

The reconductoring of the existing single-circuit 9.8 mile Metcalf to Morgan Hill and the 10.8 mile Morgan Hill to Llagas 115 kV Power Lines (carried on the same set of self-supporting lattice steel towers) (Figure 1-1) would entail replacing the existing single-circuit lines comprising three conductors (i.e., 0.73- and 0.974-inch-diameter specular 715-15 and 715.5-37 AAC conductor, respectively) with larger sized conductor having a summer emergency rating higher than 940 Amps.

The existing single circuit line from Metcalf to Morgan Hill line is supported by 74 structures: 62 lattice steel towers (ie. four concrete footings with no guy wires/rods), 10 wood poles to be replaced, 1 tubular steel pole, and 1 new pole, The Morgan Hill to Llagas existing single-circuit lines are supported by 66 structures:62 lattice steel towers, three lattice steel poles (i.e., one footing and four guy wires/rods), and one tubular steel poles (TSP), all ranging from 82 to 102 feet tall, with an average height of approximately 95 feet. The lattice steel towers and poles could be raised or replaced with new lattice steel towers and poles with non-reflective finishes; replacement structures would be approximately 25 feet taller than the existing ones. It is assumed that the existing towers and poles would be replaced, only where necessary. The cross-arms of the TSPs would be reframed to support the new conductor.

Construction

Power Line Reconductoring

Power line reconductoring would require the following:

- Staging areas/helicopter landing zones/pull and tension sites
- Access roads
- Tower removal/modifications
- New tower installation
- Vegetation clearance and removal
- Erosion and sediment control and pollution prevention
- Best management practices (BMP)
- Site cleanup and waste disposal

Power lines would be designed to be bird- and raptor-safe in accordance with the applicable recommendations presented in *Suggested Practices for Raptor Protection on Power Lines: The State of the Art in 2006* (APLIC 2006) and *Reducing Avian Collisions with Power Lines: State of the Art in 2012* (APLIC 2012).

Staging Areas/Work Areas/Helicopter Landing Zones/Pull Sites

Site preparation is not expected to be necessary for most of the staging areas, work areas, helicopter landing zones, and pull sites; however, some limited surface blading, grading, and filling to create a stable and level staging area would take place as needed. Some vegetation/crop removal, tree trimming, and matting or plating of drainage crossings may be required for vehicle access.

Construction materials would be delivered by line trucks using existing paved, dirt, and gravel roads and overland travel routes. For remote or environmentally sensitive areas, helicopter access may be required.

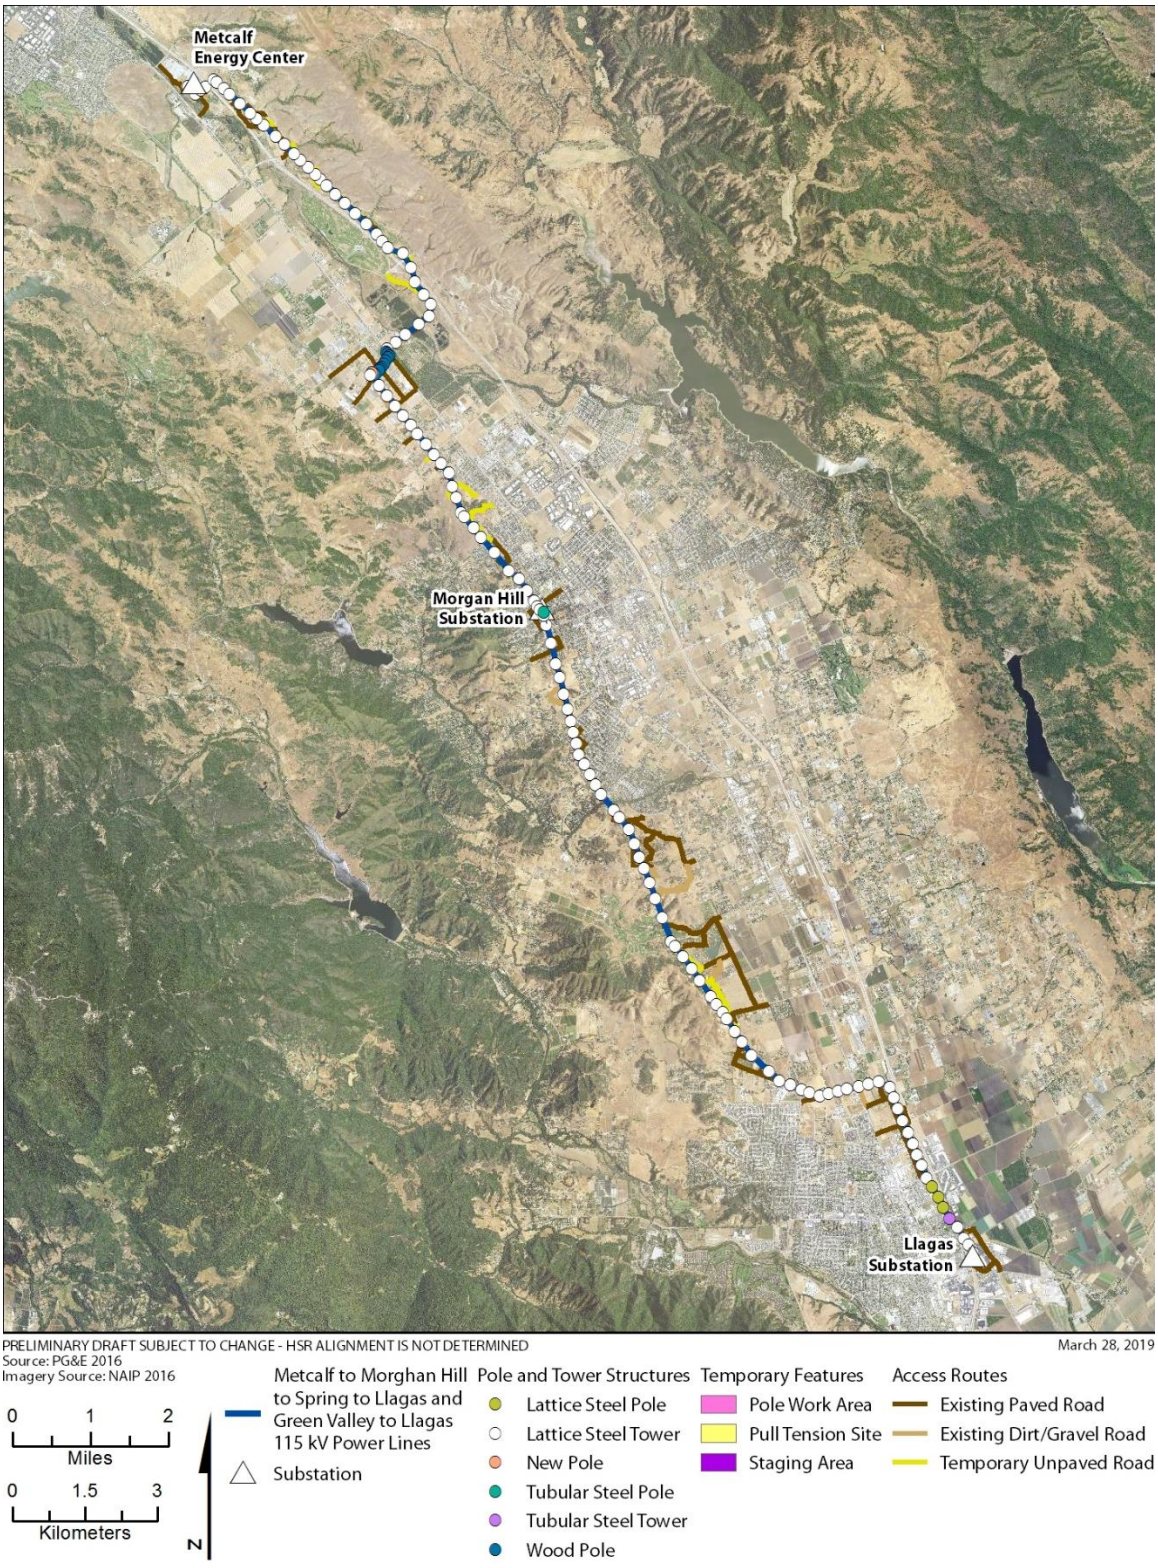

Figure 1-1 Morgan Hill to Llagas 115 kV Power Lines

Staging Areas

Construction of the project would require temporary staging and storage areas to store materials and equipment during the construction process. Materials and equipment typically staged at these areas would include construction materials; construction vehicles and facilities; crew vehicles; material removed from the existing power lines awaiting salvage, recycling, or disposal; and portable stations for concrete cleanup.

Work Areas

Modifications to lattice steel towers and poles, removal of existing lattice steel towers and poles, and assembly and installation of lattice steel towers and poles would require a maximum 0.30-acre work area at each structure site.

Pull Sites

Pull sites would be used during construction to stage conductor-pulling trucks and conductor reel trucks to install the new conductors onto the lattice steel towers and poles. To haul the conductor to the site, reel trailers with reel stands would be mounted on a line truck. On the line truck, pullers would be mounted to install the conductor. The old conductor would be removed from the sites on a line truck.

Access

The project would be accessed using existing paved, dirt, and gravel roads and temporary unpaved access roads that would be constructed for the project. Temporary unpaved access roads will be used if no existing roads can be feasibly used. No new permanent access roads would be constructed for reconductoring. Upgrades would performed within the existing access road corridor and would include vegetation removal, grading, filling, and repair and maintenance activities. Portions of some unpaved access roads may need to be reestablished and maintained through tree trimming, vegetation clearing, the addition of substrate, and some minor grading or blading. PG&E coordinates with landowners and compensates them for the temporary loss of revenue and reestablishment of any crop required to be removed to accommodate an access road.

Temporary Lane Closure

Temporary lane closures along streets as required for construction activities would be coordinated with local jurisdictions. PG&E is a member of the California Joint Utility Traffic Control Committee, which in 2014 published the *Work Area Protection and Traffic Control Manual*. The traffic control plans and associated text in this manual conform to the guidelines established by the federal and state departments of transportation. PG&E would follow the recommendations in this manual regarding basic standards for the safe movement of traffic on highways and streets in accordance with Section 21400 of the California Vehicle Code. These recommendations include provisions for safe access of police, fire, and other rescue vehicles. Any road closures that must be implemented on private and county roads would not typically last more than a few minutes and would be coordinated with the county or landowner.

Lattice Steel Tower and Pole Removal

Prior to removing the existing lattice steel towers and poles along the Metcalf to Morgan Hill and Morgan Hill to Llagas 115 kV Power Lines, PG&E would install temporary utility shooflies (a line of wood poles) as necessary to temporarily support the lines, allowing them to remain in service during construction. The conductors would be transferred to the shoofly wood poles, allowing workers to unbolt the tower/pole sections and remove them to be lifted by a crane and placed on an adjacent work area for dismantling. The concrete foundations would be removed using a backhoe or air compressor–powered hand tools to about 6 feet below ground with the balance abandoned in place. The remaining hole would be backfilled to grade with the excavated material, supplemented as necessary.

Structure Installation

Temporary Structures

To facilitate safe conductor installation, temporary guard structures (installed alongside roadways [one crossing of U.S. Highway 101 and one crossing of State Route 52] or at utility crossings), snub poles (single wood poles for pulling operations), and line poles (three-pole wood structures to support the temporary lines) could be installed prior to reconductoring.

Installalation of temporary wood poles begins with excavating a pole hole using an auger. Depending on the pole size, the hole dimensions would be 3–4 feet in diameter and 7–16 feet deep. Following excavation, the poles, insulators, and hardware would be delivered to the pole work area and assembled. The poles would be placed in the hole using line trucks or cranes, the remaining void would be backfilled, and the surrounding area would be compacted. Poles would be direct buried (i.e., no foundation or footing) and may be guyed for stability. Once the pole is embedded and the surrounding area is compacted, additional hardware would be installed using a bucket truck.

Permanent Structures

Typical dimensions for power line structures are provided in Table 1-1.

Table 1-1 Summary of Typical Structure Dimensions

Structure Feature	Structure Type	Approximate Metrics
Pole diameter	Temporary wood pole	1–2 feet
	Lattice steel tower	4 feet per footing
	Lattice steel pole	4–7 feet
Auger hole depth	Temporary wood pole	6.5–16 feet
	Lattice steel tower	6–12 feet
	Lattice steel pole	10–24 feet
Footprint	Temporary wood pole	1–3 square feet (temporary)
	Lattice steel tower	600–800 square feet (permanent)
	Lattice steel pole	38.5 square feet (permanent)

Source: Author's compilation 2017

Replacement of lattice steel towers and poles may be required along the Metcalf to Morgan HIll and Morgan Hill to Llagas 115 kV Power Lines. Each lattice steel tower would require four foundations, one for each structure leg, and each lattice steel pole would require one foundation. Workers would place reinforcing steel in each hole along with stub angles, which become part of the lattice steel tower/pole leg itself. Concrete forms that reach up to 2 or 3 feet above natural ground level would be placed over each hole, and concrete would be placed around the reinforcing steel and stub angles up to the top of the form.

Lattice steel tower and pole components, packaged in bundles by structure type, would be dispatched to the staging areas or to the site itself. Individual towers and poles that are assembled immediately adjacent to the foundations would be raised into place using a large crane.

Individual lattice steel towers and poles that are assembled at staging areas would be transported to their locations by helicopter. A typical tower would require two to three "lifts" or trips by helicopter to each tower location. The first lift would transport the lower portion of the tower and subsequent lifts would transport the upper portion(s) of the tower. After the structure is set on the

foundation, crews would tighten all bolts, attach insulators to the cross arms, and prepare the towers for the conductor stringing operation.

Reconductoring

During reconductoring activities, when existing conductor is replaced with new conductor, the existing power line and any distribution lines that cross or are collocated on the line could be taken out of service (known as “taking a clearance”). To avoid potential safety concerns, a road closure or a rolling stop would be arranged for any locations where lines cross over roads before conductor installation begins. Alternatively, guard structures may be installed at road crossings, as mentioned above, in lieu of road closures.

To replace conductor, the existing conductor would first be detached from its support structure and temporarily lifted. Rollers would then be installed at the conductor’s attachment point, and the conductor would be placed onto the rollers. The rollers would allow the conductor to be pulled through each structure. Installing rollers and detaching the existing conductor typically require one bucket truck. Crews would access each staging area by pickup truck or bucket truck, using existing access roads when possible.

Once the rollers are in place for an entire section of conductor, the existing conductor would be pulled out of place. A cable would be attached between the old conductor and new conductor, which would be on a reel attached to a line truck at a pull site. A line truck with a drum puller and empty conductor reel would pull the old conductor onto the reel, where it would be collected for salvage. Reel stands mounted on a line truck at the pull site would feed new conductor along the rollers that were previously installed at each structure, while also maintaining tension in the line so that it does not sag to the ground. After the conductor is pulled into place, conductor sags would be adjusted to required tensions. The conductor would then be clamped to the end of each insulator as the rollers are removed. The final step in the conductor installation process would be to install vibration dampers and other accessories as necessary. Old conductor would be removed from sites on a line truck.

For each line proposed to be reconductored, one dump truck would be required to remove materials. It is not anticipated that reconductoring work would require closure of U.S. Highway 101 or use of a helicopter at any of the crossing locations.

Packing crates, spare bolts, and construction debris would be picked up and hauled away for recycling or disposal during construction. PG&E would conduct a final inspection to confirm that cleanup activities have been successfully completed.

Helicopter Use

Construction activities associated with the Metcalf to Morgan Hill and Morgan Hillto Llagas 115 kV Power Lines may require use of up to two helicopters at one time to facilitate access to work areas. To accommodate use of helicopters, helicopter landing zones would be colocated with staging areas.

The helicopter flight path from the designated day-use landing zones would generally follow the existing alignment and would avoid flying over residences when transporting material and crews. The helicopter would generally be stationed overnight at a public or private use airport within approximately 5 miles of the proposed work area.

The helicopter type would depend on availability at the time of construction; however, the actual helicopter to be used would not be larger than a Bell L3 (long ranger) with a load capacity of approximately 1,200 pounds. The total hours of operation for each helicopter would be an estimated 32 hours (8 days of operation, 4 hours of operation per day, and two landings/take-offs per day), with a maximum of up to 42 hours (7 days of operation, 6 hours of operation per day, and four landings/take-offs per day). It is not anticipated that residents would be required to temporarily vacate their homes; however, in the unlikely event that final construction plans require otherwise, all Federal Aviation Administration (FAA) requirements would be met and PG&E would coordinate with potentially affected residents (providing a minimum of 30 days advance notice) to minimize the necessary work duration and any resultant inconvenience.

Water Usage

Water usage would generally be limited to dust suppression associated with construction activities. Construction associated with the Metcalf to Morgan Hill and Morgan Hill to Llagas 115 kV Power Lines would require up to 2,516,904 gallons of water over the entire construction period, or an average of 2,689 gallons of water per day. PG&E would obtain water from existing municipal supplies. Potable water for construction personnel would be transported to the construction site by construction vehicles. Wastewater services would be provided to the construction workers by portable toilets.

Land Disturbance

The project is anticipated to require temporary land disturbance throughout the entire project area. No net permanent impact would result. No land would be acquired to support construction. Table 1-2 shows anticipated temporary land disturbance in acres. Restoration activities would be conducted as needed and in coordination with landowners.

Approximately 22 cubic yards of material would be excavated at each lattice steel tower location and 34 cubic yards at each lattice steel pole location, for a total of approximately 2,830 cubic yards. Waste and construction materials including concrete footings and soil would be disposed of at appropriately licensed off-site facilities or would be used to backfill the holes from the structures proposed to be replaced.

Table 1-2 Anticipated Land Disturbance

Component	Temporary Land Disturbance (acres)					
	Temporary Access Road	Staging Area	Pull and Tension Site	Work Areas	Helicopter Landing Zone	Total
Metcalf to Morgan HIII	14.7	7.1	4.2	1.1	0.3	27.4
Morgan Hill to Llagas	6.3	13.1	8.5	28.5	0	56.4

Source: Author's compilation 2017

Construction Workforce and Equipment

On a typical work day, 15–20 construction workers would be at any one work area; however, because of the variety of work activities that may be completed concurrently, up to 45 workers may be distributed throughout the project area at any time. During line work, crews typically would be working at adjacent towers/poles. Construction activities would generally be scheduled during daylight hours (7:00 a.m. to 6:00 p.m.) Monday through Saturday. Nighttime construction could occur depending on clearance constraints. Tables 1-3 and 1-4 show details on workers and equipment.

Table 1-3 Typical Construction Workers and Equipment

Activity	Number of Construction Workers	Equipment Quantity and Type
Site preparation	5	1 backhoe, 1 small bulldozer, 1 truck with trailer, 1 500-gallon water truck, 1 light-duty pickup truck
Auger holes	3	1 500-gallon water truck, 1 pickup truck, 1 line truck with auger attachment
Haul material	3	1 line truck with trailer

Activity	Number of Construction Workers	Equipment Quantity and Type
Tower installation	6	1,200-ton crane, up to 2 helicopters
Conductor installation	6 per crew	1 line or semi-truck with conductor reel, 2 pickup trucks, 1 line truck with bucket/crane, 1 line truck with conductor puller, 1 line truck with conductor tensioner, up to 2 helicopters

Source: Author's compilation 2017

Table 1-4 Other Anticipated Construction Equipment

Equipment	Use
Cement and mortar mixer	Lattice steel tower/pole foundations
Dump truck	Trash removal
Excavator/fork lifts	Install mats
Gas crew truck (26,000 lbs.) with trailer	Transport equipment and materials
Generator set	Generate power for operation of tools
Hand-digging equipment	Use for air or hydrologic-operated tooling
Mechanics service trucks	Service and repair vehicles
Motor grader	Grade work areas and access roads
Pickup truck (1 ton)	Transport equipment and materials
Plate compactor	Grading
Pump	Dewater and/or water for dirt suppression, if necessary
Rough terrain forklift	Activities associated with transport of poles
Sweeper/scrubber	Clean roads, if necessary
Vacuum trailer	Clean up potential concrete washout during foundation installation

Source: Author's compilation 2017

Construction Schedule

Construction would begin in 2027 and be completed within approximately 24 months. Due to line outage restrictions, reconductoring of the two lines (Metcalf to Morgan Hill 115 kV Power Line [12 months] and Morgan Hill to Llagas 115 kV Power Line [12 months]) would not take place concurrently.

Operations and Maintenance Activities

Operation and maintenance activities would remain unchanged from current conditions.

APPENDIX 2-G: SUMMARY OF REQUIREMENTS FOR OPERATIONS AND MAINTENANCE FACILITIES

Summary of Requirements for Maintenance Facilities

Prepared by:	Joseph Metzler, Operations	March 14, 2016 Date
Checked by:	Paul Hebditch, Operations	March 14, 2016 Date
	Jonathan Scott, Maintenance	March 14, 2016 Date
Approved by:	Simon Whitehorn, Deputy Director, Operations & Maintenance	March 14, 2016 Date
Released by:	Gary Griggs, Program Director	March 14, 2016 Date

Revision	Date	Description
0	25 Aug 2009	Initial Release as TM 5.3
1	21 Mar 2013	Update for Blended Service Plan, remove from TM format, incorporate Authority comments
2	16 Mar 2016	Full revision confirming maintenance facility locations to support 2016 Business Plan

1.0 INTRODUCTION

1.1 PURPOSE

The purpose of this report is to define the Rail Delivery Partner's (RDP) analysis of the optimal siting of facilities for Heavy and Light Maintenance Facilities for rolling stock, and for Maintenance of Infrastructure (MOI) locations across the high speed rail network. The report also provides an updated comprehensive listing of requirements for those facilities throughout the phased implementation of the California High-Speed Rail (HSR) Program.

The type of maintenance facilities required to support the Phase 1 service are as follows:-

- Heavy Maintenance Facility (HMF) for rolling stock
- Light Maintenance Facility (LMF) for rolling stock
- Maintenance of Infrastructure Facility (MOIF)
- Maintenance of Infrastructure Siding (MOIS)

The focus of this report is to update the locations and number of tracks required at each facility to be consistent with the 2016 business plan, taking into account current procurement philosophy, and recent and ongoing developments with respect to environmental clearance and right-of-way acquisition. As such, earlier guidance on such things as track geometry, functional requirements, etc. provided by previously issued technical memoranda and other documents remains in effect except as specifically described in this report.

The overall goal is to better inform at the preliminary design phase the decisions associated with engineering and environmental clearance.

1.2 SOURCE DOCUMENTS

Source documents used to develop this memorandum include:

- Technical Memorandum 5.1, *Terminal and Heavy Maintenance Facility Guidelines,* 8/25/09
- Technical Memorandum 5.3, *Summary Description of Guidelines for: Heavy Maintenance Facility (HMF), Terminal Layup/Storage & Maintenance Facilities & Right-of-Way Maintenance Facilities,* 8/25/09
- Memorandum, Summary of Requirements for O&M Facilities, 3/21/13
- Directive Drawing TM 5.1-A *Heavy Maintenance Facility (HMF) Concept Plan,* 5/29/09
- Directive Drawing TM 5.1-H *MOI Yard*, 8/30/11
- Directive Drawing TM 5.1-I *MOI Siding*, 8/30/11
- *Concept of Operations,* Draft, Rev 5, 12/11/15
- *Maintenance of Infrastructure – Concept and Requirements*, Draft, Rev 3, 6/30/15
- *Rolling Stock Maintenance Plan – Preliminary Draft*, Rev 4, 6/26/12
- *California High Speed Rail Program –Maintenance Facility Location Analysis Dec.8, 2015 ver.02*

The information derived from these source documents has been updated, where appropriate, to reflect the phased-implementation strategy being developed for the California High-Speed Rail Authority's 2016 Business Plan.

1.3 ASSUMPTIONS

1.3.1 Rolling stock

- will be operated and maintained in configurations of 660-foot trainsets, potentially operated in double trainsets of 1,320-foot total length.
- fleet size is expected to grow from a small initial procurement for the early stage service offering, increasing to 90 trainsets for the full Phase 1 service plan.
- maintenance will follow a 5-level hierarchy of functions:
    - Level I – Daily inspections, pre-departure cleaning and testing
    - Level II – Monthly inspections
    - Level III – Quarterly inspections, including wheel-truing
    - Level IV – Annual inspections, including underside/bogie inspection
    - Level V – Overhaul, component change out, commissioning and decommissioning
- The rolling stock life cycle is 25-30 years, including a "heavy" overhaul. Bogie overhaul will occur at 600,000 mile intervals, equating to approximately 3-year cycles and in advance of the heavy overhaul. Heavy overhaul cycles (Level 5) occur at 3-5 year intervals in the rolling stock life cycle, staggered to work through the fleet in stages.
- fleet size includes a nominal 20% margin for trainsets identified as a "spare ratio" and positioned for maintenance/inspection backup, hot standby for breakdowns, and seasonal or other service demand fluctuations. It is assumed that 10% of the fleet will be out of revenue service awaiting or undergoing maintenance. Storage space for accommodating reserve equipment is accounted for in each facility.

1.3.2 Heavy and light maintenance facilities for rolling stock

- sized to handle projected system growth to the year 2040.
- designed to accommodate two 660-foot trainsets each. Capacity for trainsets is estimated to be at 80% of total possible space in the yard, in order to provide room to maneuver the equipment to and from the shop areas and the main tracks and to allow some room for growth.
- tracks are designed to serve as storage for trainsets that are to be used for revenue service. The majority of these tracks are to be used for middle of the day or overnight layup of trainsets. The trainsets will need to make non-revenue trips between the MOE facility and the origin or destination at the beginning or end of revenue service, respectively.
- include spare tracks designed to serve as storage for trainsets that are waiting to undergo maintenance. The number of these tracks varies based on the type of MOE facility as the shop tracks for higher maintenance levels could be occupied for longer periods of time.
- shop tracks are for trainsets that are currently undergoing maintenance. The number of these tracks varies based on the type of MOE facility as there will be a greater number of specialized maintenance activities performed at higher maintenance levels.
- shop tracks are designed to accommodate a minimum of one trainset each. Shop capacity for holding/storing trainsets is set at 50% of total possible space in the shop area, in order to accommodate various shop track functionalities and to provide room to maneuver equipment.
- Additional tracks in each HMF and LMF has been set aside for MOI equipment storage. Work trains, track and tie installation trains and rail trains may be among the types of equipment stored on these tracks.

1.3.3 General assumptions

- All the sites for HMF, LMF and MOI facilities are identified to best support the full Phase 1 system (from San Francisco and Merced to Anaheim) and to avoid the need to build temporary facilities during the phased construction of the system.
- Phase 1 Service requirements identified in this document were developed to support the ridership forecasts and service plan of the 2016 Business Plan, and include the service to/from Anaheim.

- Impacts to environmental resources will be avoided and/or minimized to the extent feasible in the locating of facilities.
- The optimal locations have been identified taking into account the limitations of geography at specific site locations based on available site footprints and using the best and newest information available.
- Maintenance staff will be able to start their assignment at the site of work or nearest MOIF/S each night regardless of their residence and their base MOIF.
- Maximum achievable speed of MOI equipment in mobilization and de-mobilization will be 60 MPH.

DRAFT

2.0 FACILITIES SITE LOCATION CRITERIA

2.1 RECOMMENDED LOCATIONS

Based on a service design driven by the ridership demand forecast, an operating plan was developed to define train schedules and estimate the number of trainsets required. In order to support the commissioning activities, layup/storage and maintenance program requirements (Levels I, II, III, IV, V - and ultimate de-commissioning of the fleet, concepts were developed to provide the requisite tracks and shop buildings. The following rolling stock facilities are recommended:

- Brisbane LMF
- Gilroy LMF
- Central Valley HMF
- Antelope Valley LMF
- Los Angeles, West Yard LMF
- Los Angeles, Montebello Yard LMF
- Anaheim LMF

In addition, right-of-way maintenance requirements were examined, and a description of a “typical” MOIF and MOIS configuration has been developed. Assuming Caltrain will be responsible for maintenance between San Francisco and San Jose, recommendations for approximate locations along the high-speed train system alignment were identified. These are namely

- Gilroy MOIF
- Los Banos MOIS
- Madera MOIF
- Corcoran MOIS
- Shafter MOIF
- Edison MOIS
- Tehachapi MOIS
- Lancaster MOIF
- Glendale MOIF
- Fullerton MOIS

Preliminary guidelines and criteria applicable to the design of the HMF, LMF, MOIF, and MOIS have been prepared. The size and configuration of these facilities were estimated based on defining the capabilities and functional requirements necessary to support the activities critical to efficiently maintaining and safely operating the rolling stock fleet and physical plant.

Regional consultant teams used these preliminary guidelines and criteria to identify suitable site alternatives at which to locate the various facilities. The feasibility of each of these site alternatives was then evaluated from an operational, engineering, and environmental standpoint. Viable sites were carried forward for additional review. Non-viable sites were eliminated from future consideration. Using information gathered during this process, revised service plans were prepared to adjust to local conditions to validate design assumptions and to update the preliminary guidelines and criteria which are presented in this memorandum.

DRAFT

Figure 1 is a schematic diagram showing the relative locations of all the facilities at full build-out of the California HSR System. The approximate location of each facility through the progression of phased development through Phase 1 is shown in Figure 1.

Figure 1 – Schematic of O&M Facilities

2.2 RATIONALE FOR THE LOCATION AND FUNCTION

2.2.1 Overview: Rolling Stock Maintenance Facilities

- It is desirable that the HMF is located centrally between Merced and Bakersfield such that only one such facility is required for full HSR operation. The facility should:
    - provide direct connection to the main track enabling quick access
    - be activated prior to delivery of new train-sets for purposes of (potential) assembly and to have the functional requirements of the facility available during the required testing, acceptance and commissioning of the fleet
- The location of each LMF facility needs to be selected based upon limiting the amount of deadhead miles required to move trainsets for the revenue-service trip
- Minimizing deadhead miles needs to be traded against the aim to keep the number of facilities to a minimum. For instance, Level 1 facilities for storing equipment, light cleaning and as on-board crew bases, will help in reducing deadhead miles at strategic locations within the system
- Facilities should be located to support the startup and close down of service
- The sensitivities of placing a HMF/LMF in an urban environment also need to be considered
- The location of facilities is designed to facilitate the provision of desirable arrival and departure times for business travelers to the primary markets at each end of the HSR phase 1 network from intermediate stations
- All facilities have potential access to Class 1 Railroads to enable transshipment of material and equipment from outside sources.

2.2.2 Overview: MOI Facilities

- MOIF should be located to support the efficient use of the maintenance access times available between the first and the last trains of the day operating on each section of the network.
- Five MOIF locations, two in the north half and three in the south half of the system should be sufficient to cater for the “heavy” maintenance activities associated with track, overhead contact system (OCS) and signal and communication systems
- These are then supplemented by MOIS, which should ideally be evenly spaced along the network between MOIFs to provide sufficient storage for on-track equipment required to be placed strategically prior to the beginning of the overnight maintenance access
- MOIS should have capacity to temporarily store maintenance equipment and supplies of the on-track MOI equipment temporarily located there to minimize the need for transit moves to/from one of the MOIFs
- There should be additional space provided to enable staff to park their vehicles at each MOIS to allow for them to report or dismiss at those locations
- Each of the MOIF and MOIS should be also able to support the on- and off-tracking of high-rail and other road-rail convertible equipment
- The use of the refuge sidings at intermediate stations will also allow for on-track equipment to be stored at each of these locations to further improve upon access times available for work

DRAFT

2.3 LOCATION ANALYSIS

2.3.1 Rolling Stock Maintenance Facilities

2.3.1.1 Northern California, Phase 1

It is envisioned that there will be only one location in the northern section of the route that will handle the activities associated with a Level III facility. The two potential locations identified in this report at Brisbane and Gilroy are however envisioned to work together. Whichever location is finally determined to be the best to handle the Level III activity then it is still a requirement for the other one be developed such that is equipped to handle lower level activity. As such at this stage it is recommended both locations be cleared as Level III capable LMF locations from an environmental perspective.

Several LMF site alternatives have been identified in the vicinity of Gilroy, with a likely alternative in the vicinity of Morgan Hill, approximately 10 miles north of Gilroy station and approximately 20 miles south of San Jose Diridon station. A LMF site alternative has been identified in Brisbane, approximately 10 miles south of San Francisco Transbay Station. For the purposes of the service planning done for this report the locations for the two northern LMFs have been assumed. These locations are consistent with the service planning done for the 2016 Business Plan.

2.3.1.2 HMF in the Central Valley

Several site alternatives for the HMF in the Central Valley are currently being considered from Fresno in the north to Shafter in the south. For the purposes of the service planning done for this report the HMF has been assumed to be located in Fresno, approximately 10 miles south of Fresno Station. Again this location is consistent with the service planning done for the 2016 Business Plan.

2.3.1.3 LMFs in Southern California for Phase 1

The southern LMFs are also envisioned to work in concert with each other. Preliminary guidance given in the memorandum, Summary of Requirements for O&M Facilities, 3/21/13, called for two LMFs with the larger facility being located in Los Angeles, either in the San Fernando Valley or the Los Angeles Basin, that would handle up to Level III maintenance and the smaller facility in the Antelope Valley near Palmdale that would handle up to Level I maintenance.

As it was determined for Northern California, although only one level III facility will be needed finally, it is recommended that two level III facilities will have to be cleared environmentally to ensure that the region will have adequate maintenance capability.

Five potential sites have been identified in Southern California as potential LMF locations: Antelope Valley, East Bank LA, West Bank LA, Montebello Yard and Anaheim.

The Antelope Valley site located in Lancaster provides the necessary acreage for activities up to Level III, but is more remote from Los Angeles than desirable thereby creating more deadhead miles than sites closer to Los Angeles. This site is therefore preferred as a Level I facility unless the Montebello site cannot be secured and developed.

The site at Montebello is also potentially a suitable Level III facility adjacent to the proposed mainline alignment 10 miles south of LAUS. This site would be ideally located and can provide sufficient space for storage and shop activities to serve both LAUS and Anaheim for the beginning and end of operational service. This is the preferred Level III site in Southern California.

The sites at East and West Bank identified as part of the Southern California Regional Interconnection Project (SCRIP) whilst closer to LAUS both present less than ideal solutions. The East bank alternative in particular is problematic owing to its inability to provide storage for Anaheim based trains and the fact that it is elevated. For these reasons the East Bank site is not recommended for progression.

The West bank site is much better located and can serve as level I storage to support morning operations from LAUS station as a run-through facility. If the Montebello site is not possible and the Antelope Valley site becomes the Southern California Level III LMF then the West Bank site must be built to support operations at LAUS.

To accommodate a service of up to 4 TPH to Anaheim, an additional, small two track LMFs has been proposed in Anaheim, mainly for trainset layup purposes. Maintenance at the Anaheim LMF will be limited to Level I activities due to limited available land in the area.

Before a final decision on the location of the Southern California LMFs can be made further comparative studies, design and review activities must be undertaken.

Table 1 – Summary of HMF/LMFs

Facility Location	Facility Type	Number of Tracks	Maximum Maintenance Level (Rolling Stock Facilities Only)	Year 2025 (Projected Fleet Size of 19 Trainsets)		Year 2034 (Projected Fleet Size of 90 Trainsets)		Year 2059 (Projected Fleet Size of 110 Trainsets)	
				Trainsets at Each Facility [1]	Morning Train Starts from Each Facility [2]	Trainsets at Each Facility [1]	Morning Train Starts from Each Facility [2]	Trainsets at Each Facility [1]	Morning Train Starts from Each Facility [2]
Brisbane	LMF	13 yard 2 or 8 shop	III (or I) [3]	8 to 10	6 to 8	14 to 17	10 to 13	16 to 21	12 to 17
Gilroy	LMF	10 yard 8 or 2 shop	I (or III) [3]	8 to 10 (See Note)	6 to 8 (See Note)	13 to 15	12 to 14	13 to 17	12 to 16
Central Valley	HMF	14 yard 10 shop	V	9 to 12	6 to 8	20 to 22	11 to 13	22 to 24	13 to 15
Antelope Valley	LMF	21 yard 8 shop	I (or III) [4]	N/A	N/A	9 to 29	8 to 25	13 to 37	12 to 32
Los Angeles (West Bank)[5]	LMF	7 yard	I or II	N/A	N/A	9 to 14	8 to 13	13 to 19	12 to 18
Montebello	LMF	21 yard 8 shop	III (or I) [4]	N/A	N/A	9 to 29	8 to 25	13 to 37	12 to 32
Anaheim	LMF	2 yard	I	N/A	N/A	1 to 3	1 to 3	2 to 5	2 to 5

[1] Number of trainsets (as single consists) at each facility is given as a range to allow for unknown availability of station tracks for overnight layup and for storage of consists that have been outfitted with autonomous inspection and measurement equipment.

[2] Number of morning starts (as single consists) from each facility differs from the number of trainsets stored at each facility due to allowances for hot standby trainsets, high-demand spares, and maintenance downtime.

[3] Maximum maintenance level at Brisbane could be lowered to Level I if the facility in Gilroy is built with the Level III capability,

[4] Maximum maintenance level at Antelope Valley facility could be potentially lowered to Level I if the facility at Montebello is built with the Level III capability.

[5] If the facility in Montebello is not built, West Bank facility would be necessary to support operations at LA Union Station.

2.3.2 Maintenance Of Infrastructure Facilities

It is anticipated that the maintenance of infrastructure on the Caltrain corridor will be undertaken by the Caltrain. As such this report makes no recommendation to site an MOI between San Francisco and San Jose. If one is required in future consideration could be given to co-locating this with an MOE at Brisbane.

A site has been environmentally cleared for a MOIF in Fresno. This same site is currently being considered as an HMF site alternative. Ideally it would be good to collocate both facilities at this location. Should this not be possible, the Fresno MOIF could move to a site in Madera, approximately 25 miles to the north. At this stage it would be prudent to environmentally clear this site.

Preliminary guidance given in the memorandum, Summary of Requirements for O&M Facilities, 3/21/13, called for an MOIS in Hanford. As the HSR track alignment was designed to traverse Hanford on viaduct, an alternative at-grade location for the MOIS was sought to the south so as to keep the distances to the Fresno and Shafter MOIF sites roughly equal. A site was identified and environmentally cleared for an MOIS in Corcoran, approximately 20 miles south of Hanford.

Preliminary guidance given in the memorandum, Summary of Requirements for O&M Facilities, 3/21/13, called for MOIFs in Shafter and Palmdale with two MOISs in between, at Tehachapi and Rosamond, to support infrastructure maintenance in the Tehachapi mountain range area. A suitable MOIF site has been identified in northern Lancaster, approximately 20 miles north of Palmdale, and the Shafter MOIF site has also shifted approximately 5 miles farther north as a result of preliminary design refinement. The MOIS locations between these two MOIF sites have also been shifted slightly to the north to maintain roughly even spacing between all of the facilities

The recommended locations for MOISs are now Edison and Tehachapi instead of Tehachapi and Rosamond. The proximate MOIS to the south has also been moved north for the same reason. The recommended location for this MOIS is now Santa Clarita instead of Sylmar. Note that the Santa Clarita location would only be appropriate if HSR follows the SR14 alignment.

In addition to providing MOI capabilities, the locations at Edison and Tehachapi should also be equipped to support access for the emergency services to the nearby tunnel sections and to act as rally points for passengers in the event that a tunnel evacuation is necessary. Further, these locations should also have one track with OCS and facilities to aid detraining of passengers in an emergency.

Although, to date, no agreements have been reached with other railroads in Southern California to identify infrastructure maintenance responsibilities, it is envisioned that the Authority will be required to make provision to maintain those rights of way that are dedicated for their use and assets provided solely for high speed train operation, e.g. the traction electrification system.

Preliminary guidance given in the memorandum, Summary of Requirements for O&M Facilities, 3/21/13, called for no MOIF south of the San Gabriel Mountains, but this was based on LAUS serving as the southern terminal station.

With the Phase 1 running to Anaheim, an MOIF south of the San Gabriel Mountains is necessary. Additionally, with long tunnels currently under consideration between Palmdale and Burbank, an MOIF south of the San Gabriel Mountains would reduce the amount of maintenance trips through the tunnels and would provide access to the tunnels from the south.

Earlier drafts of the MOI Concept and Requirements had envisioned an MOIF near Anaheim, but this was only appropriate while an extension of HSR south to Irvine was being contemplated. With the southern terminal station in Anaheim, a centrally located MOIF in Glendale is now recommended, supported by an MOIS to the south in Fullerton. It may be acceptable for the Glendale MOIF to be smaller than the other MOIFs as its maintenance functions may be limited, but this would be dependent on specific conditions outlined in agreements with other railroads.

Table 2 – HMF, LMF and MOI locations

Proposed Facility	Miles (from SF Transbay)	Approximate location name	Comment
LMF	5.00	Brisbane	▪ Level III facility to support train servicing and start up and close down of service at San Francisco. ▪ Corresponds to location of previously proposed LMF. ▪ This site could also function as a level I site on a smaller footprint to support service for the San Francisco terminals
LMF	60.00	Coyote (between San Jose and Morgan Hill)	▪ Level I facility to support train servicing and start up and close down of service at San Jose, Gilroy and Merced. Will need to clear a level III facility at this location based on the availability of the Brisbane site or the phasing requirements of the project. ▪ Corresponds to the most likely of several alternative sites already being considered for a LMF. ▪ Co-location of this facility with the nearby MOIF is possible.
MOIF	80.00	Just South of Gilroy station	▪ Corresponds to location of previously proposed MOIF. ▪ Co-location of this facility with the nearby LMF is possible.
MOIS	120.00	(west of) Los Banos	▪ Corresponds to location of previously proposed MOIS.
MOIF	180.00	Madera (just south of Madera Acres, about 15 miles north of Fresno Station)	▪ Corresponds roughly to the locations currently being considered for two MOIF alternative sites. ▪ These two Madera/Parksdale locations appear to be ideally situated from a geometric standpoint (ample tangents at-grade)
HMF	230.00	Between Fresno and Kings-Tulare	▪ There are a number of potential locations in the Central Valley that would be appropriate for the HMF. Provided the site meets the criteria outlined elsewhere in this report any of the current proposals would be acceptable. ▪ This location is shown for indicative purposes only.

DRAFT

Proposed Facility	Miles (from SF Transbay)	Approximate location name	Comment
MOIS	240.00	Corcoran	▪ Corresponds roughly to location of previously proposed (and environmentally cleared) MOIS in Corcoran. Recommend keeping Corcoran as MOIS location.
MOIF	300.00	Shafter	▪ The originally proposed location, in Bakersfield by 7th Standard Road, was ultimately rejected for an MOIF next to a Halliburton facility in northern Bakersfield ▪ The site was rejected for a number of reasons, including that the main tracks would be on a high viaduct through this area, and a MOIF here would have not complemented planned land uses for the area ▪ Preliminary design of an MOIF in Shafter - approximately 10 miles to the north and just south of the FCS – is currently being progressed
MOIS	320.00	Edison	▪ For the staging of work trains and equipment. ▪ Can serve as an area of safe refuge for passengers or crews in the event of a tunnel emergency incident.
MOIS	330.00	Tehachapi	▪ For the staging of work trains and equipment. ▪ Can serve as an area of safe refuge for passengers or crews in the event of a tunnel emergency incident.

DRAFT

Proposed Facility	Miles (from SF Transbay)	Approximate location name	Comment
MOIF	360.00	Lancaster	▪ This proposed location is in the northern Antelope Valley, just south of the town of Tehachapi ▪ This location is unsuitable for an MOIF due to the (relatively, for a railroad) steep terrain, the proximity of a large wind farm in the area, and the proximity of a quarry that routinely engages in blasting activities ▪ A more suitable location would be farther south in the Antelope Valley (areas to the north are mountainous until you reach the Central Valley at approximately Edison on the outskirts of Bakersfield, although there is a bit of a plateau at the town of Tehachapi) ▪ The identified site in north Lancaster, approximately 30 miles farther south, is more suitable for an MOIF ▪ The Tehachapi Mountain Range (and also the San Gabriel Mountains to a lesser degree) is prone to seasonal weather extremes, including snow, landslides, and wildfires that occasionally require shutdown of main transportation routes ▪ For this reason, the previous proposal has two proposed MOISs, in Edison and Tehachapi, between the Central Valley and the Antelope Valley
LMF	390.00	Antelope Valley	▪ Level I facility to support train servicing and start up and close down of service to the north of Los Angeles ▪ At this stage, should be cleared as a level III facility as contingency if Montebello site is not feasible. ▪ Located at the previously proposed location, but reduced in size on the assumption that a sufficiently large facility can be found near to LA Union station ▪ The communities in the Antelope Valley have historically been willing to work with the Authority and have been somewhat (relatively) receptive to HSR facilities in their communities.

DRAFT

Proposed Facility	Miles (from SF Transbay)	Approximate location name	Comment
MOIF	450.00	Glendale	▪ An MOIF in the vicinity of Glendale is recommended to serve the LA metropolitan area. Note that the Santa Clarita Valley and Antelope Valley were temporarily cut off from Los Angeles immediately after the Northridge earthquake as there are limited road connections between these areas, making it risky to only serve the LA metropolitan area from points north of the San Gabriel Mountains. ▪ If the East Corridor alternatives through the San Gabriel Mountains get advanced, this facility would also provide a means to perform maintenance activities from the south. ▪ Additional capabilities to stage work trains and equipment in proximity to portals of long tunnels should be evaluated when those designs have been sufficiently advanced.
LMF	455.00	Los Angeles: West Bank Yard Option	▪ Level I facility for storage of trains adjacent to LAUS.
LMF	460.00	Los Angeles: Montebello Yard Option	▪ Level III facility to support train servicing and start up and close down of service at Los Angeles and Anaheim ▪ Use of two or three separate packages of land could be a solution; however careful, detailed consideration would need to be given to the layout of each site and the consequential deadhead moves required between locations to enable full maintenance of rolling stock
MOIS	470.00	Fullerton	▪ For the staging of work trains and equipment.
LMF	475.00	Anaheim	▪ Small Level I facility located north of the station to store trainsets preparatory to morning service

DRAFT

3.0 FACILITIES DESCRIPTIONS

3.1 HEAVY MAINTENANCE FACILITY

The Heavy Maintenance Facility (HMF) is a key element of the California High-Speed Train system. Locating the HMF in the central part of the system is critical to the efficient implementation of operating and equipment maintenance plans. Functional requirements of the HMF site include: receipt, setup and commissioning of equipment; heavy maintenance and repairs; and decommissioning of equipment at end-of-service-life milestones. These activities require yard tracks, each capable of holding two complete trainsets, plus two runaround/transfer tracks to move from one end of the facility to the other.

The HMF will support Level I through Level V maintenance activities, the only such facility in the California HSR System, although Level V maintenance activities do not begin until 3-5 years into the equipment life cycle. Level I-III maintenance activities will require 4 inspection/service tracks, 1 wheel-truing track with drop table, and 1 track equipped with lift equipment to accommodate an entire trainset intact. All servicing tracks for Level I-III maintenance will be accessible from the outside on both ends, allowing for pass-through movement of the equipment.

Level IV-V maintenance activities include the lifting of equipment for underside inspection, heavy repairs, major component change-out, and modifications or upgrades of equipment. To support these activities, the HMF shop facilities will include 4 heavy maintenance tracks, all with interior access capable of enclosing an entire trainset. The end result is a total of 10 tracks inside the shop building. The shop facilities will be segregated into individual functional areas including run-though servicing and inspection, running repairs, truck/bogie shop, component cleaning, brake shop, electronics shop, HVAC unit repair, pantograph repair, battery storage and repair, a paint shop, and a wheel shop that includes wheel truing capability.

Setup of equipment includes space to accommodate the receipt, assembly, testing, acceptance and commissioning of up to 35 trainsets prior to the start of revenue service. The shop facility requirements for setup and commissioning will be based upon the trainset manufacturer's recommendations. The HMF must be adjacent to the main track alignment in order to facilitate efficient, effective testing of equipment: must be near to repair facilities in case of malfunction, technicians must have ready access to equipment and facilities, and distance traveled for deadhead moves should be minimized in order to maximize the effective use of the testing windows.

Speed through the train wash will be limited, so one dedicated train wash track should be added so as to not create a bottleneck at the facility. The location of this track can vary based on the configuration of the facility, but it should be placed where the majority of trainsets will enter the facility from the main tracks and must be long enough for trainsets to stop in advance of the train wash without fouling the main tracks. If this train-wash track is combined with one of the lead tracks entering the facility, special track-work must be added to allow trainsets to bypass the train wash track when occupied. Wheel defect detection equipment should be placed on the incoming lead track(s) to ensure that all vehicles are inspected. This equipment should be placed before the train wash.

Development of HMF functions during stage works

The functions of the HMF evolve as the California HSR System matures. Initially, during the Testing/Commissioning phase prior to the startup phase, the HMF supports all setup, final assembly and integration of systems, testing/commissioning and maintenance of the rolling stock for the system with the potential to layup the entire fleet if necessary. Two shop tracks will be dedicated to setup of new equipment. These tracks will evolve into functioning service tracks as the revenue service levels mature, requiring the addition of two new setup tracks within the shop building.

The HMF will then support operations service levels for approximately half of the system. Supporting the revenue service includes cleaning and servicing activities between runs, pre-departure inspections and testing, and train wash and wheel defect detection.

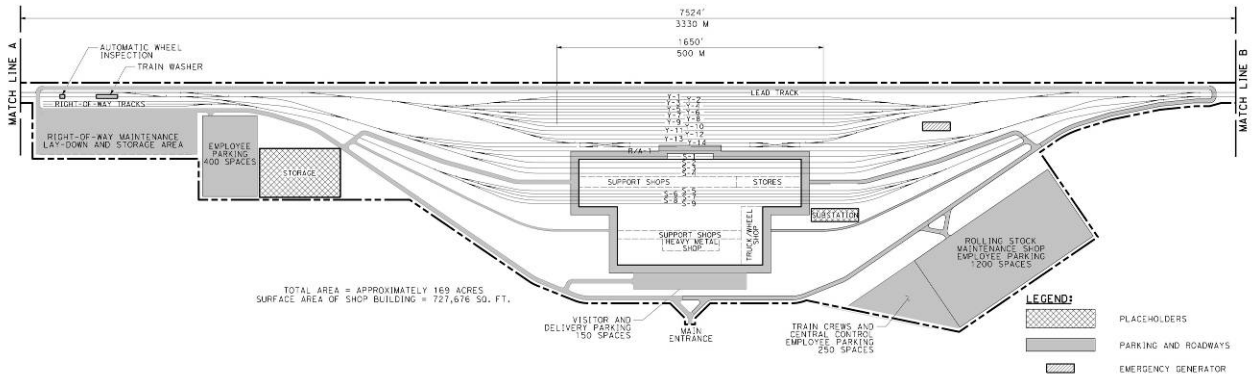
During later phases of operation the HMF transitions to a more traditional maintenance role of centralized maintenance and repair. Minimal daily service is dispatched from the HMF during these phases due to the greater distances to the outer terminals. Phase 1 also includes storage capacity to satisfy the need to accept and commission additional equipment to support Phase 2 Full Build service levels, plus acceptance and commissioning of new equipment while at the same time decommissioning older equipment at end-of-service-life milestones.

Layout and size of the HMF

The layout of the HMF in relation to the main tracks will have a significant effect on HMF functionality and the flow of trains on the main tracks. The recommended HMF configuration that maximizes main track capacity and minimizes the effects on the revenue service plan includes direct main track access achieved though double-ended yard leads to facilitate movements both north and south without changing direction, grade-separated flyovers to access the main track opposite the HMF without affecting main track traffic, 60 MPH interlockings with universal crossovers at the main tracks (on both ends, immediately adjacent to the main track turnouts), and 1,700-foot transition tracks to reduce/increase speed to/from stop and to transition the automatic train control system.

The result is a total estimated length of about 7,500 feet (not including transition tracks), an estimated width of about 1,200 feet (at the widest point), and an overall estimated minimum footprint of about 170 acres. Figure 3 shows a conceptual layout for the HMF (See Appendix B for the plan in larger size). Note that this conceptual layout depicts a facility with the maintenance shop tracks arranged parallel to and alongside the storage tracks, but that in-line facilities with the maintenance shop tracks arranged parallel to and in series with the storage tracks may also be acceptable, and in some cases even preferred, and may be considered on a case-by-case basis to accommodate site constraints.

Figure 2 – Heavy Maintenance Facility Concept Plan



Less optimal configurations might include at-grade or "flat" interlockings, single 60 MPH crossovers at the main tracks (on both ends, immediately adjacent or within up to 3 miles of the main track turnouts), turnout speeds in interlockings of less than 60 MPH, shorter transition tracks, and single-ended facilities. Note that a single-ended HMF could be considered on a case-by-case basis depending on the proposed location of a site relative to the nearest station and on the operational details of the service plan. Work-arounds to these conditions could include additional deadhead miles or time in order to avoid delays to revenue trains by deadhead movements, additional operating crews in order to expedite reverse movements in the facility and/or on the main track, and alterations to maintenance scheduling to accommodate the arrival of deadhead trains at non-peak hours of operation. The operational and cost impacts of these less optimal configurations must be analyzed further in order to evaluate the trade-off of the additional yearly operating costs versus the increased capital construction costs and the potential increase in environmental impacts.

Other facilities that could be co-located with the HMF include the Operations Control Center and a Maintenance of Infrastructure Facility. Locating these facilities as an integral part of, or adjacent to, the HMF may allow for better coordination and utilization of operations systems and assets, while also potentially reducing the overall footprint required for the facilities. Locating these facilities away from the

HMF will not necessarily introduce negative impacts. The individual requirements for these facilities will be discussed in further detail in separate sections of this report.

Commissioning

- The HMF must be sited adjacent to the main track.
- Maintenance buildings, dispatch sites and training facilities should be located in the HMF at this juncture to support the testing and commissioning of the HSR system. Post this phase this facilities would transition to provide on-going support to the HSR system.
- Personnel for Train Control, Communication, SCADA and other systems must be trained and those systems tested prior to Trainset commissioning.
- Tactical discussion and debriefing will be necessary as the systems are placed on line. Central location will be important for the successful integration of multiple cross functional systems
- Vendors will better be able to supervise and staff systems integration effort for warranty and operations testing

Initial Operations

- Central location will make for better strategic response in the event of a service disruption by making the discipline leaders available for face to face coordination.
- Training and on the job experience will be easier and cheaper to accomplish by the existence of a co-located facility. Split facilities will result in additional training costs to the operating entity.

It should be noted that locating these facilities separate from the HMF will not necessarily introduce negative impacts that could not be effectively managed/mitigated.

DRAFT

3.2 LIGHT MAINTENANCE FACILITY

Terminal station locations will be supported by a Light Maintenance Facility (LMF) for the purpose of supplying freshly-inspected and serviced trainsets at the start of revenue service. The LMFs will be sized accordingly.

LMF locations will additionally be sized to support either Level I, Level II or Level III maintenance activities. These activities include cleaning and servicing activities between runs, pre-departure inspections and testing, and monthly inspection and maintenance activities. Level III functionality includes train wash and wheel defect detection facilities. For Level II and Level III facilities, daily servicing, and monthly and quarterly inspections and maintenance will be made utilizing inside shop tracks with interior access and inspection pits for underside and bogie inspections.

Table 3 summarizes shop track requirements at each facility based on the maintenance level. It should be noted however, number of shop tracks actually required at each facility could potentially changes from the numbers in Table 3 and needs to be determined based on the actual train operating plans and associated fleet manipulation plans.

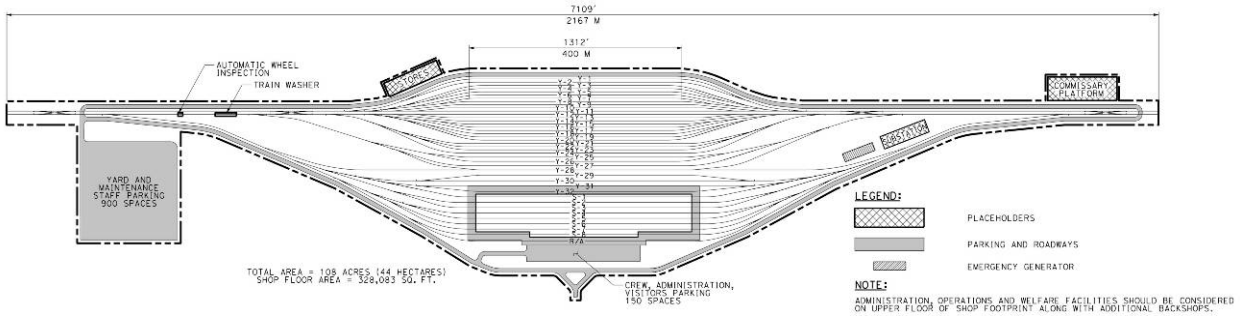
Table 3 – Summary of Shop Tracks at Each Maintenance Level

Facility Type	Maintenance Level	Number of Maintenance Shop Tracks
LMF	Up to I	0
	Up to II	2
	Up to III	8
HMF	Up to V	10

The LMFs will require yard tracks, each capable of holding two complete trainsets, plus two runaround/transfer tracks to move from one end of the facility to the other. In the case of Level III LMFs, speed through the train wash will be limited, so one dedicated train wash track should be added so as to not create a bottleneck at the facility. The location of this track can vary based on the configuration of the facility, but it should be placed where the majority of trainsets will enter the facility from the main tracks and must be long enough for trainsets to stop in advance of the train wash without fouling the main tracks. If this train-wash track is combined with one of the lead tracks entering the facility, special track work must be added to allow trainsets to bypass the train wash track when occupied. Wheel defect detection equipment should be placed on the incoming lead track(s) to ensure that all vehicles are inspected. This equipment should be placed before the train wash.

The layout of the LMF in relation to the main tracks will have a significant effect on LMF functionality and the flow of trains on the main tracks. The recommended LMF configuration includes direct main track access achieved through double-ended yard leads to facilitate movements both north and south without changing direction, grade separated flyovers to access the main track opposite the LMF without affecting main track traffic, 60 MPH interlockings with universal crossovers at the main tracks (on both ends, immediately adjacent to the main track turnouts), and 1,700-foot transition tracks to reduce/increase speed to/from stop and to transition the automatic train control system. The result is a total estimated length of about 7,500 feet (not including transition tracks) with a width dependent on the number of tracks required at each facility, and an overall estimated minimum footprint of ranging from about 40 to about 110 acres. Figure 4 shows a conceptual layout for the LMF (See Appendix C for the plan in larger size). It should be noted that this conceptual layout depicts a facility with the maintenance shop tracks arranged parallel to and alongside the storage tracks, but that in-line facilities with the maintenance shop tracks arranged parallel to and in series with the storage tracks may also be acceptable, and in some cases even preferred, and may be considered on a case-by-case basis to accommodate site constraints.

Figure 3 – LMF Concept Plan



Less optimal configurations might include at-grade or “flat” interlockings, single 60 MPH crossovers at the main tracks (on both ends, immediately adjacent or within up to 3 miles of the main track turnouts), turnout speeds in interlockings of less than 60 MPH, shorter transition tracks, and single-ended facilities. Note that a single-ended LMF could be considered on a case-by-case basis depending on the proposed location of a site relative to the nearest station and on the operational details of the service plan. Work-arounds to these conditions could include additional deadhead miles or time in order to avoid delays to revenue trains by deadhead movements, additional operating crews in order to expedite reverse movements in the facility and/or on the main track, and alterations to maintenance scheduling to accommodate the arrival of deadhead trains at non-peak hours of operation. The operational and cost impacts of these less optimal configurations must be analyzed further in order to evaluate the trade-off of the additional yearly operating costs versus the increased capital construction costs and the potential increase in environmental impacts.

Other facilities that could be co-located with an LMF include an MOIF. Locating these facilities as an integral part of, or adjacent to, the LMF could facilitate better coordination and utilization of operations systems and assets, while also potentially reducing the overall footprint required for the facilities. Locating these facilities away from the LMF will not necessarily introduce negative impacts that could not be effectively managed/mitigated.

DRAFT

3.3 MAINTENANCE OF INFRASTRUCTURE FACILITIES

The infrastructure will be maintained from regional MOIFs located at approximately 100- to 150-mile intervals. The MOIF will be sized and outfitted to support the maintenance of infrastructure requirements for approximately 50 to 75 miles in either direction, supported by a Maintenance of Infrastructure Siding (discussed later) within each 50- to 75-mile segment. The 100- to 150-mile territory covered by each MOIF accommodates the time for equipment traveling at 60 mph to reach locations along the alignment during the five-hour non-revenue maintenance period. Resources will be assigned according to the specific needs of the adjacent territory (for example, the Palmdale MOIF will support maintenance activities for tunnels and high-viaducts that will not be the responsibility of the Fresno MOIF).

The MOIFs will be the locations of regional maintenance machinery servicing storage, materials storage, personnel, and maintenance and administration.

Functional requirements of the MOIF sites include:

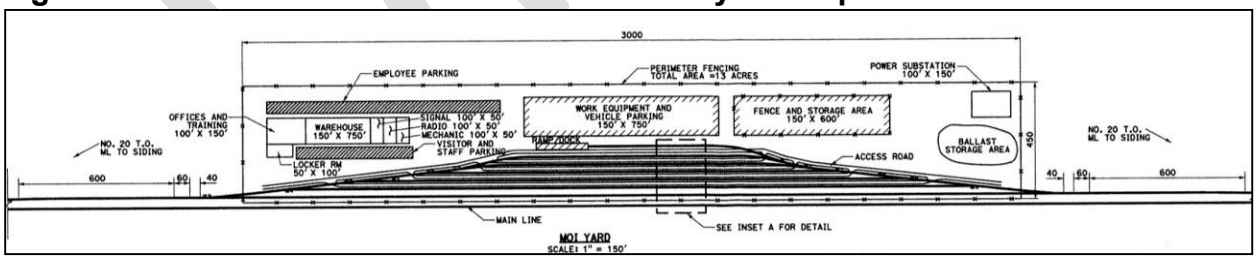
- 6 yard tracks plus one siding track (1,600 feet).
- Approximately 8,150 feet of yard track capacity.
- Shop facilities for the following activities: MOI inventory, infrastructure and equipment maintenance/repair.
- Stockpile areas for ballast and other bulk materials.
- Secured stockpile areas for non-bulk materials.
- Rail side unloading dock and continuously welded rail (CWR) train storage (1600').
- Rail-borne equipment and locomotive storage tracks.
- Road-rail vehicle access locations.

Main track access is accomplished through 50 MPH (#20) turnouts with 60 MPH single crossovers immediately beyond (or within up to 1 mile of) the turnouts at both ends to facilitate efficient movement to either main track from either end of the facility. Location of the MOIF near main track universal crossover locations may remove the need for one or both of these 60 MPH single crossovers.

Co-location of an MOIF with the nearest HMF or LMF may be considered to consolidate HSR resources and minimize community impacts.

Also required is effective connectivity to the highway road network and access to utilities including water, gas, electricity, sewer and communications. MOIF facilities are estimated to be approximately 30 acres in size, inclusive of roadways and parking. Figure 5 shows a conceptual layout and sizing for the MOIF (See Appendix D for the plan in larger size).

Figure 4 – Maintenance of Infrastructure Facility Concept Plan



3.4 MAINTENANCE OF INFRASTRUCTURE SIDINGS

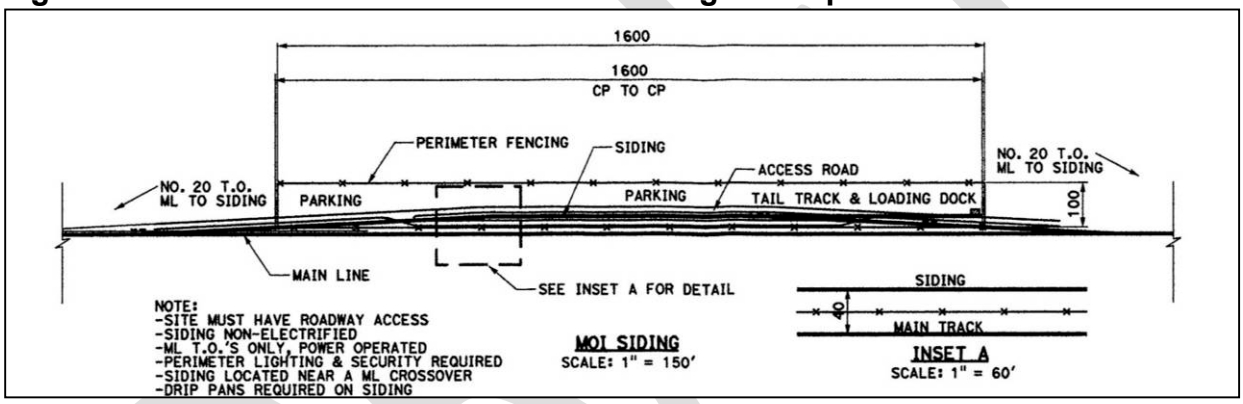
Maintenance of Infrastructure Sidings (MOIS) will be centrally located within the 50- to 75-mile maintenance sections on either side of each MOIF. The purpose of the MOIS facilities is to support the MOIF activities by providing a location for layover of maintenance of infrastructure equipment and temporary storage of materials and other resources needed in the adjacent section. The goal is to reduce travel time required to arrive at the maintenance location, thereby enhancing the efficiency and productivity of the maintenance activities.

Functional requirements of the MOIS sites include:

- One siding track (1,600 feet)
- One tail track (200 feet).
- Stockpile areas for ballast and other bulk materials.
- Secured stockpile areas for non-bulk materials.
- Road-rail vehicle access locations.

MOIS facilities are estimated to be approximately 5 acres in size. Figure 6 shows the conceptual layout and sizing for the MOIS (See Appendix E for the plan in larger size).

Figure 5 – Maintenance of Infrastructure Siding Concept Plan



Main track access is accomplished through 50 MPH (#20) turnouts with 60 MPH single crossovers immediately beyond (or within up to 1 mile of) the turnouts at both ends to facilitate efficient movement to either main track from either end. Location of the MOIF near main track universal crossover locations may remove the need for one or both of these 60 MPH single crossovers. More than one location may be required in some MOI territories as a result of difficult terrain such as in the Tehachapi Mountains.

4.0 OTHER FACTORS

4.1 ROADWAY ACCESS AND PARKING

The conceptual layout of the roadways and parking areas needed to support the O&M facilities has been developed based on the following assumptions:

Access and Circulation

- Access/egress primarily controlled at a single gated entry point. A perimeter security fence would be installed around the entire facility, connecting to the HSR access-restriction fencing along the corridor. A safety fence would be installed to separate the facility from the main tracks to prevent accidental entry.
- A two-way circulation road, 24 feet wide, would follow the interior perimeter of each facility
- Roadways to provide access to specific locations in the building(s) and yard(s) would be considered, as shown on the conceptual schematics
- For the HMF and LMFs, a 50-foot wide asphalt "apron" would surround the main shop building to provide access for emergency vehicles to any point around the structure
- For the HMF, a pedestrian "bridge" over the train yard tracks would be used to connect the employees' parking lot on one side of the yard tracks and the main shop building on the other side should the design result in the need to cross active tracks

Parking:

- At the HMF, approximately 330 employees are estimated to be accommodated during "peak shifts," including consideration of overlapping departure and arrivals of personnel in various operations, dispatching, and maintenance duties. It is assumed that approximately twenty percent of employees would commute by modes other than single-occupied automobile, such as walking, bicycle, public transportation, and/or ridesharing, resulting in an eighty percent automobile mode share for employee work trips. The public transportation share would be employees commuting via bus or a possible employee train stop off the CHST system
- It is estimated that the parking demand for HMF rolling stock shop maintenance employees would require space for approximately 310 vehicles based on the estimate of eighty percent automobile mode share and 85% typical utilization of the parking spaces (320 x 80% / 85% = 310.6).

4.2 ENVIRONMENTAL CONSIDERATIONS

Impacts to the natural, physical and human environment must be addressed in the development of criteria for locating of facilities. A fatal-flaw level of analysis should include, but not be limited to, the identification of impacts from the siting of facilities to:

- Potential relocation of residences and businesses
- Relocations or displacements of key economic generators
- State and Federal waters
- Historic, archeological and cultural resources (such as those protected un Section 4(f) and Section 106)
- Areas of known biological habitats or other sensitive protected lands
- Compatibility with adjacent land uses

In addition, to ensure a satisfactory range of alternatives under State and Federal law, multiple site alternatives for the HMF and LMF sites should be developed and fully analyzed in project-level EIR/EIS documents. MOIF and MOIS sites should be located appropriately and analyzed as part of each corridor alternative.

4.3 COMMERCIAL CONSIDERATIONS

The facilities will have specific commercial and personnel requirements. The areas where these facilities will be located will need to be able to provide the labor forces to staff the facilities and the programs to train them and/or the services to attract skilled employees from other areas to move to these locations. The following are approximate personnel needs for each of the facilities:

Table 4 – Approximate Facility Personnel Needs

Facility Type	Approximate Personnel Needs (at Each Facility)
HMF	~ 330
LMF	100 – 150
MOIF	~230

These employees would need to have the requisite training to perform their functions in addition to the pre-requisite common basic knowledge and skills to perform professional work, such as basic computer use skill. For some positions, there are already qualified personnel in California and in the Central Valley but for other functions, such as maintenance of signaling systems and OCS, new training programs will have to be developed and skilled employees from other parts of the country will need to be attracted to the area.

For the higher skilled positions, training programs will need to be developed and can potentially be housed at some of the many Central Valley colleges and universities such as California State University (CSU) Bakersfield, CSU Fresno, CSU Stanislaus, University of California (UC) Merced, the community colleges in the area, and other public and private colleges. Other positions may require apprenticeship and qualification programs through the various craft unions. As operation of these facilities approaches, the exact needs of the system will become clearer and the training and hiring programs can be customized for the system and be housed at appropriate locations.

4.4 CONNECTIVITY ISSUES

In addition to the items that are described above and depicted on the concept schematics, there are other requirements that will have to be provided to support the operation of these facilities:

- Connectivity provision for the facilities roadways (as shown on the schematics) to the local road and highway network providing access/egress for (examples):
    - Employees commuting by automobile
    - Convenient access to public transportation
    - Deliveries of materials and supplies (using heavy trucks)
    - Emergency response personnel such as the fire department and medical teams
- Connectivity provision to the electric power grid to power the buildings, shops and trains. These facilities are currently described at a concept level and the requirements will be clarified as design progresses.

- For the HMF and LMFs, substations will need to be constructed at the site that would support power needs for:
    - Train storage
    - Train movements
    - Shop operations
    - All other buildings and facilities
- For the HMF and LMFs, it is expected that this approach would require a new utility service from the nearest utility distribution line. In this case, it is estimated that ~13.8kV lines would not be sufficient and that a ~34.5kV service into a split step down facility is preferred. The overhead contact system (OCS) would be (isolated from the main line) supplied by a standard 1x25kV transformer, and the HMF would be fed from standard transformers which could distribute 480v 3ph throughout the facility
- Connectivity to the water system, and both storm and sanitary sewer systems for personnel and industrial purposes. These facilities will provide train washing and toilet servicing for the revenue equipment fleet. Water supply would also be required for employee locker room/bathroom facilities, interior building maintenance activities, and commercial food service needs. Local wastewater treatment may be required for the train wash facility.
- Consideration for refuse removal services

1.0 MANAGEMENT COMMITMENT AND PHILOSOPHY

1.1 Safety and Security Policy Statement

Safety and Security Policy Statement

It is the policy of the California High-Speed Rail Authority (Authority) to perform work on the California High-Speed Train System (CHSTS) in a manner that ensures the safety and security of passengers, employees, contractors, emergency responders, and the public. The application of system safety and security comprises a fundamental hazard and vulnerability management process that incorporates the characteristics of planning, design, construction, testing, operational readiness, and subsequent operation of the high-speed rail system. Safety and security are priority considerations in the planning and execution of all work activities on the CHSTS.

All trains, facilities, systems and operational processes must be designed, constructed, and implemented in a manner that promotes the safety and security of persons and property. The design, construction testing, and start-up of the CHSTS will comply with applicable safety and security laws, regulations, requirements and railroad industry practices. The Authority will maintain or improve upon the public transit and railroad industry standards for safety and security. Through the Reliability, Availability, Maintainability, and Safety (RAMS) Program a standard of safety will be established that is as safe as or safer than conventional U.S. railroad operations and in conformance with the best practices and standards for safety in the international high-speed rail industry. The design, construction, testing, and start-up of the CHSTS will be accomplished in compliance with this standard.

The Authority is committed to providing a safe and secure travel and work environment. Therefore, safety, accident prevention, and security breach prevention must be incorporated into the performance of every employee task. All Authority, Program Management Team, and contractor personnel, subcontractors and employees are charged with the responsibility for ensuring the safety and security of passengers, employees, contractors, emergency responders, and the public who come in contact with the CHSTS. Each individual and organization is responsible for hazard and vulnerability management, for applying the processes that are designed to ensure safety and security, and for maintaining established safety and security standards, consistent with their position and organizational function. Through a cooperative team effort and the systemic application of safety and security principles, the CHSTS will be designed, constructed, tested, and placed into service in a safe and secure manner.

Jeff Morales — 12-5-12

Jeffrey Morales, CEO
California High-Speed Rail Authority

Date

1.2 Background

The Federal Railroad Administration (FRA) requires that the California High-Speed Rail Authority (Authority) implement safety and security principles and processes throughout the development and operation of the California High-Speed Rail Program (CHSRP). Absent federal regulations that govern the completion of major capital projects, FRA looks to the Federal Transit Administration (FTA) regulations for guidance. Federal Transit Administration (FTA) regulations found at 49 CFR Part 633 requires the development of a *Project Management Plan* (PMP) for every major capital transit project. As described in FTA Circular 5800.1 Safety *and Security Management Guidance for Major Capital Projects,* (dated 8/1/07) a Safety *and Security Management Plan* (SSMP) is the element of the PMP that manages project safety and security activities, responsibilities, and verification processes throughout the project life cycle. This document fulfills the FRA requirement for managing safety and security in the development and operation of the CHSRP.

The SSMP does not carry over into revenue operations, but will lead to development of a System Safety Program Plan (SSPP),Security Program Plan (SPP) and Emergency Preparedness Plan (EMP) to govern safety and security for the operating system prior to the start of revenue service. The FRA is in the process of promulgating regulations that require the application of a System Safety Program Plan to inter-city passenger railroad operations.

1.3 Purpose of the SSMP

The SSMP formalizes the management principles and strategies for determining safety and security risk acceptance throughout the CHSRP life cycle, from the design phase through the start of revenue service, and is applied to each segment undertaken in turn. The SSMP defines the process for identifying, evaluating, and resolving safety hazards and security vulnerabilities associated with future railroad operations of the System prior to the start of revenue service. This process helps to ensure the achievement of the highest practical level of operational safety and security for the riding public, the employees, and anyone coming into contact with the CHSRP.

The purpose of the SSMP is to define the safety and security activities of the CHSRP and methods for identifying, evaluating, and resolving potential safety hazards and security vulnerabilities. It establishes responsibility and accountability for safety and security during the preliminary engineering, final design, construction, testing, and start-up phases of CHSRP development. Specifically, the SSMP does the following:

- Establishes the Authority's commitment and philosophy to achieve the highest practical level of safety and security for the Authority's staff, Rail Delivery Partner (RDP) staff, contractors, emergency responders, and members of the public that come into contact with the CHSRP
- Establishes processes for managing safety and security activities intended to minimize risk of injury and property damage, and to maximize the safety and security for the CHSRP passengers, employees, and the public
- Integrates the safety and security functions and activities throughout the CHSRP and its organizational structure
- Defines the safety and security responsibilities between the Authority and CHSRP design, construction, and start-up teams
- Defines the process for the documentation and certification of safety and security activities
- Evaluates project phases and activities to ensure continued development and advancement of safety and security principles
- Establishes the framework for construction safety and security

1.4 Applicability and Scope of SSMP

The SSMP is applicable to all phases of CHSRP development, from preliminary engineering through final design, construction, testing and the start of revenue service. The SSMP encompasses all equipment, infrastructure, operating and maintenance plans and procedures associated with the CHSRP.

1.4.1 Project Description

The CHSRP will construct a state-of-the-art, statewide, high-speed performance passenger railroad based on operating practices and designs of existing high-speed rail networks in Europe and Asia which have had extraordinary performance and safety records. The CHSRP will require certification by federal and other regulatory agencies which have indicated they are open to approaches which provide equivalent or better safety than existing rail regulations in the United States. The Authority's eventual goal is to develop a system of more than 800 route miles that provides high-speed rail service between the major metropolitan centers of the San Francisco Bay Area and Sacramento in the north, through the Central Valley, to Los Angeles, Anaheim, Irvine and San Diego in the south.

The CHSRP trains will operate at speeds up to 220 mph within its dedicated or shared-use corridors where the CHSRP has sole use of a track, and up to 110 mph in shared-use conditions where there is joint use of tracks with other rail carriers. No hazardous materials will be transported or permitted to be transported on Authority trains or by others on Authority dedicated tracks.

The service will use high-speed steel-wheel on steel-rail technology which has been service-proven in Asia and Europe and provides a high level of service in terms of safety, comfort, and reliability. The system will operate on a mostly dedicated, fully grade-separated standard gage track with electric trains powered through the use of an overhead contact system (OCS). The right-of-way will make use of tunneling and elevated structures to achieve an ideal alignment and profile. Automotive, animal, other railroad and non-railroad equipment crossings will be accomplished by means of an underpass or overpass.

The system will include an Automatic Train Control (ATC) system based on designs for similar high-speed environments in Europe and Asia, modified only where necessary to meet regulatory requirements and functional and performance needs specific to the CHSRP. The ATC system will cover all functions of a train control system including both safety critical and non-safety critical operations and will incorporate Positive Train Control in compliance with 49 CFR Part 236. A hazard detection system will be applied throughout the CHSRP where supported by hazard analysis to alert the operating control center of natural events such as seismic activity, excessive wind speeds, high water levels, and excessive ambient temperature levels that trigger a system response; and other events such as vehicle or rail car intrusion, and trespassers.

1.4.2 Phased Implementation

Although Preliminary Engineering Phase activities will occur simultaneously for the entire system, the Final Design and Construction Phase activities will be developed in phases according to geographic segments, due to the size of the eventual system. The Initial Construction Segment (ICS) has been designated as a point north of Madera to a point north of Bakersfield. Subsequent segments will extend north and south from the ICS.

The Initial Operating Segment (IOS) will encompass several construction segments, with high-speed operations planned between San Jose in the north and a point north of Bakersfield in the south. The SSMP has been developed with processes that will ensure conformance to system safety goals and requirements throughout the life-cycle of the CHSRP and while various segments are under different development phases simultaneously.

1.4.3 SSMP Scope

This SSMP encompasses the following equipment, facilities, plans, and procedures as they relate to the System.

- System-Wide Elements – includes the passenger vehicles, train control and signaling, voice and data communications, closed-circuit television cameras and recorders, overhead contact system, traction power substations, track, and auxiliary vehicles and equipment
- Fixed Facilities – includes rail stations; pedestrian overpasses and underpasses; highway overpasses and underpasses; aerial and other elevated structures; below-grade structures and tunnels; operations and maintenance facilities including storage yards, shops, and sidings; administrative facilities; and the Central Control Facility
- Safety and Security Plans and Procedures – includes items such as Safety and Security Certification Plan (SSCP), safety and security related Design Criteria, Passenger Train Emergency Preparedness Plan (PTEPP), SSPP, SPP and EMP.
- Procedures and Instructions – includes items such as: hazard management, operations and maintenance plans procedures, rulebooks and manuals; and training programs for operating, maintenance and management employees, employee qualifications, contractor training, and emergency responder training.

1.5 SSMP Goals and Objectives

1.5.1 Goals

The goals of the SSMP are as follows:

- Ensure that the system initiated into revenue service is safe and secure for passengers, employees, emergency response personnel, and the general public through a formal program of safety and security certification
- Ensure that the design, acquisition, construction, fabrication, installation, and testing of critical elements of CHSRP development will be verified for conformance with the established safety and security requirements and validated for achieving an effective level of safety and security
- Ensure that a mechanism is in place for the resolution of any restriction to full safety and security certification
- Establish a Construction Safety and Security Program that provides appropriate safeguards against injuries to employees and the public, damage to property and the environment, as well as minimizes security breaches, during all CHSRP work activities
- Achieve a level of risk that is acceptable to the Authority through a systematic approach to hazard and threat/vulnerabilities management

1.5.2 Objectives

The SSMP goals will be achieved by meeting the following objectives:

- Identifying, evaluating, resolving, and documenting safety hazards and security vulnerabilities at the earliest possible phase of CHSRP development, applying the *Prevention through Design* principle where possible
- Establishing specific safety and security requirements for the CHSRP based on applicable safety and security regulations, codes, standards, guidelines, and recognized best practices both domestically and internationally where applicable
- Certifying that all CHSRP facilities, systems, and equipment have been designed, built, procured, installed, inspected, and tested in accordance with the safety and security requirements found in design criteria and specifications
- Implementing CHSRP construction safety and security programs in conformance with established construction safety and security requirements and complying with the California Occupational Safety and Health Administrative safety regulations for construction projects
- Establishing a program for the completion of training of personnel who will respond to emergencies, including CHSRP personnel and emergency responders, on the CHSRP emergency procedures, equipment, and operations
- Establishing and documenting the qualifications and training programs for all personnel who will operate and maintain the CHSRP in revenue service
- Conducting and documenting emergency exercises and drills prior to the start of revenue service
- Documenting safety, security, and emergency rules and procedures for CHSRP employees, staff, and contractors in the form of rulebooks, standard operating procedures, emergency operating procedures, and other documents
- Maintaining a process to manage and track open safety and security issues resulting from design deviations, change orders, and non-conformances from inception through closure and acceptance

- Documenting final Safety and Security Certification for the CHSRP segment under consideration by means of a Final Safety and Security Certification Report to the FRA prior to placing that segment into revenue service
- Ensuring coordination with the Federal Railroad Administration, California Public Utilities Commission, the Transportation Security Administration, the Office of the State Fire Marshal, and other external agencies as applicable

1.6 SSMP Review and Updates

The SSMP will be reviewed at least annually, whenever the Program Management Plan or other reference documents are modified, and following any SSMP audit to ensure the safety and security management program remains current and applicable. If revised, the SSMP will be re-issued to all SSMP recipients. The SSMP will be updated to reflect changes in the CHSRP, the Authority's organizational makeup, or the safety and security management program requirements. The review and update process will be the responsibility of the Authority with the oversight and coordination of the Authority's System Safety Manager.

The Federal Railroad Administration is developing regulations for inter-city passenger rail system safety programs, to be codified under 49 CFR, Part 270. This SSMP is written to be in conformance with proposed regulations for 49 CFR, Part 270 and will support the project management requirements of a System Safety Program Plan.

1.7 SSMP Applicability to Third Parties

The safety and security requirements for third party assets (adjacent infrastructure or operations, shared-use corridors, utility interfaces, etc.) will be developed following the safety and security management program of the applicable third party but in conformance to the processes and requirements of this SSMP. Safety and security certification of third party elements shall conform to the Safety and Security Certification Program requirements of the third party and Section 7 of this SSMP.

1.8 System Safety Program Plan and System Security Plan

A System Safety Program Plan (SSPP) will be developed prior to the start of revenue operations. The SSPP will comply with all FRA and other applicable regulatory requirements, and will be appropriate in scope and content to manage the transition the CHSRP safety program from a project to an operating system.

A System Security Program Plan (SPP) will also be developed prior to the start of revenue operations. The SPP will comply with all Department of Homeland Security (DHS) and other applicable regulatory requirements, and will be appropriate in scope and content to manage the transition the CHSRP security program from a project to an operating system

2.0 INTEGRATION OF SAFETY AND SECURITY INTO THE CHSRP DEVELOPMENT PROCESS

2.1 Safety and Security Activities

This section describes the safety and security activities that have been or will be performed during the major phases of the project. A list of the basic activities and the desired milestone goals are presented in Table 2-1. The California High-Speed Rail Program has four phases:

- Preliminary Engineering
- Final Design
- Construction
- Testing and Startup of Revenue Operations

Although Preliminary Engineering Phase activities will occur simultaneously for the entire system, the Final Design and Construction Phase activities will be developed in phases according to geographic segments, due to the size of the eventual system. The SSMP has been developed with processes that will ensure conformance to system safety goals and requirements throughout the life-cycle of the CHSRP and while various segments are under different development phases simultaneously.

Within each phase of the CHSRP, activities are identified to determine the safety and security-related certification activities expected to be accomplished at each project milestone. The California High-Speed Rail Authority will apply a detailed and thorough safety and security certification program. The safety and security certification program, as described in Section 7.4 of this SSMP, will ensure that the project achieves all safety and security requirements in design criteria and specifications and that the safety and security contents of the plans, procedures, and training materials are systematically reviewed and revised as required.

Leading up to and through the Preliminary Engineering phase of the project, the safety and security activities encompass the following:

- Develop the SSMP, including a process for achieving safety and security certification, to meet all FRA requirements for a safety and security management plan in a major capital project, in conformance with the FTA's Circular 5800.1 *Safety and Security Management guidance for Major Capital Projects*.
- Develop a list of safety-critical and security-critical elements and items for the CHSRP Preliminary Hazard Analyses (PHA) and Threat and Vulnerability Assessment (TVA).
- Specify safety and security certification requirements, in conformance with the process identified in the *CHSRP Verification and Validation Management Plan*, in contract documents. Safety and security certification requirements will be part of the scope of work for the design/build contractors during the Final Design and Construction phases of the project.
- Implement a hazard and certification tracking system.
- Perform a PHA and a TVA to identify certifiable elements and hazards/vulnerabilities requiring mitigation. Identify hazard/vulnerability mitigation from the PHA and TVA to be incorporated into preliminary and final designs. Perform additional analysis as required.
- Develop design criteria conformance checklists, known as Critical Items Lists (CIL). The tracking system will be an integrated subset of the Verification and Validation program applied throughout the CHSRP.

Table 2-1 Project Safety and Security Activities Matrix

Task No.	Safety and Security Task	Project Phase

2.2 Procedures and Resources

2.2.1 Procedures

A *CHSRP Project Management Plan* (PMP) for the system has been prepared. The PMP establishes the framework for managing and administering all activities related to implementation of the system and provides guidance for the coordination of activities. The PMP identifies that the RDP is responsible for

developing the basic design requirements of the high-speed rail system, ensuring that common approaches for the environmental and outreach work are used through the entire alignment, preparing and helping execute bid and procurement processes for design, construction, maintenance, and operations, and managing the work of or coordinating with a variety of other consultants to the Authority, notably the Regional Consultants (RC).

A major component of the PMP is this *Safety and Security Management Plan*, describing processes for identifying and managing hazards and vulnerabilities associated with the CHSRP. It is the responsibility of the Authority to ensure that the management of identified safety hazards and security threats and vulnerabilities is effective and integrated throughout the design, construction, testing, and startup phases of the CHSRP.

The verification and validation process will be applied throughout the CHSRP for the purpose of tracking and verifying that critical elements are incorporated into all project phases. Critical elements include safety-critical and security-critical elements as identified though the hazard management processes identified in this SSMP.

2.2.2 Resources

The Chief Executive Officer authorizes the SSMP, ensuring that it is applied throughout the CHSRP. The Risk Manager administers and oversees the implementation of the SSMP. The Authority will provide additional safety and security management resources for executing the system safety and security activities during the Preliminary Engineering phase. Further resources and responsibilities will be identified as the system progresses into later phases, culminating in startup and commissioning.

The budget and schedule for implementation of the SSMP is revised each year and is held with the Risk Manager. This assures that the requirements of the SSMP are executed by the Authority, supported by the RDP, during the Preliminary Engineering phase and in subsequent phases of the project. This includes, but is not limited to, the performance of safety analyses and security assessments at the appropriate phases of the project; implementation of a Safety and Security Certification Program beginning at Preliminary Engineering and continuing through each subsequent phase of the project; a process to ensure that safety issues and security concerns are addressed and tracked to resolution; and construction safety oversight activities as appropriate to the Construction phases and contracts under way at the time.

2.3 Interfacing with Management

The California High-Speed Rail Authority Chief Executive Officer, through the Authority Director of Risk Management, has the ultimate decision-making authority for safety and security issues and is responsible for communication of safety and security issues to the Authority Board of Directors. The Authority Director of Risk Management will oversee the overall implementation of the safety and security program and will report the progress and challenges in its implementation to the Safety and Security Program Committee. The Safety and Security Program Committee will communicate the safety and security issues to the Authority executive management through reports to the Safety and Security Executive Committee.

Successful implementation of the SSMP will also require significant interaction between various members of the Authority, the Rail Delivery Partner, Contractors, Regional Consultants, Engineering/Construction Managers, and Emergency Response Agencies. These interactions will occur during regularly scheduled meetings of the Safety and Security Program Committee (SSPC) and Safety and Security Executive Committee (SSEC) that focus on the safety and security aspects of the system.

3.0 SAFETY AND SECURITY RESPONSIBILITIES

3.1 Roles and Responsibilities

The California High-Speed Rail Authority (Authority) is responsible for developing a high-speed train system in California in a safe and secure manner, ensuring that all trains, facilities, systems and operational processes are designed, constructed, and implemented in a manner that promotes the safety and security of persons and property. The Authority has the ultimate authority and responsibility for the implementation of the *Safety and Security Management Plan* (SSMP) for this system. The Authority is tasked to prepare a plan and design for the system, conduct environmental studies and obtain necessary permits, and undertake the construction and operation of a high-speed train passenger network in California.

The Authority Safety and Security Manager, under the direction of the Authority Director of Risk Management, administers and oversees the implementation and activities of the Safety and Security Program. See Risk, Safety and Security Organizational Chart in Appendix A. The Authority's primary vehicle for oversight of the safety and security activities is a tiered organization of safety and security committees (explained in detail in Section 3.3).

The Federal Railroad Administration (FRA) is the lead agency for the Federal Environmental Impact Statement. The FRA is also the primary regulatory agency responsible for approving and certifying the system safety and security aspects of the CHSRP. At the state level, the California Office of the State Fire Marshal has regulatory authority over the fire and life safety aspects of the occupied structures, including right-of-way access/egress facilities

The Authority has contracted with WSP | Parsons Brinckerhoff (PB) as the Rail Delivery Partner (RDP), and five Regional Consultant (RC) teams to conduct the preliminary engineering on specific segments of the line and provide overall Program Management for the CHSRP.

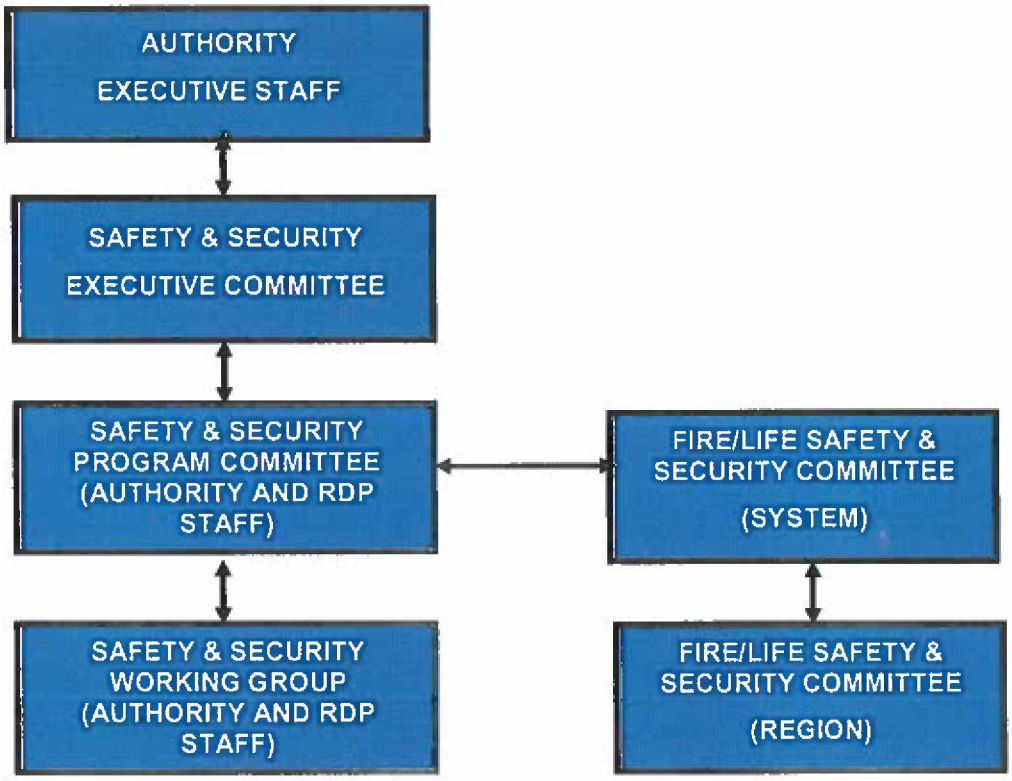
The RDP is responsible for the management of the preliminary design of the high-speed train system, including ensuring that system safety and security is applied consistently and effectively for the entire CHSRP alignment and across all phases of the project.

The RDP Safety and Security Managers will support the Authority Safety and Security Manager in the application of safety and security in all aspects and phases of the project coordinating with the Program Deputy Directors, Discipline Managers, and Regional Managers. This support will ensure that other individual project staff members perform in accordance with the SSMP in establishing and overseeing the safety and security management tasks. The RDP's primary vehicle for input to and support of the safety and security activities is the Safety and Security Program Committee (explained in detail in Section 3.3.2).

Staff members assigned to the CHSRP by the Authority, RDP, contractors, consultants, emergency response agencies, FRA and CPUC are responsible for ensuring that the design, construction, installation, and testing of all safety-critical and security-critical system elements of the system are evaluated for conformance with the safety and security requirements and verified for operational readiness before completing each phase of the project.

Refer to Figure 3-1 for the CHSRP organizational chart for safety and security activities. This SSMP shall be updated to reflect any significant changes in the organizational structure or definition of responsibilities with respect to safety and security in the CHSRP.

Figure 3-1 CHSRP Organization for Safety and Security Activities



3.2 Authority Organization

The Authority has a nine-member policy board and a core staff, supported by contract with private consulting firms (the RDP, Regional Consultants and other specialty firms) to carry out the project's system safety and security programs, environmental studies, project planning and engineering work under the supervision and guidance of Authority staff. The Authority's Director of Risk Management is responsible for safety and security activities, reporting directly to the Chief Executive Officer.

The project organization will remain in place throughout the CHSRP development process; however, the composition of the project organization may be revised to respond appropriately to the changing project needs as the project proceeds through from the preliminary engineering phase through to the start of revenue service. The Authority project organization during the initial project phases comprises the Authority and RDP staff supplemented by Regional Consultant staff. In each phase, the Authority will use the assistance of the RDP to manage project-related activities, as well as further assistance from professional engineering and other project management consulting firms.

The current California High-Speed Rail Authority organization is shown in Appendix A.

3.2.1 Authority Chief Executive Officer

The Authority Chief Executive Officer oversees and directs the management of all Authority staff and the Rail Delivery Partner. The day-to-day management of the development activities for the California High-Speed Rail Program is the functional responsibility of the Authority Program Director under the direction of the Authority Chief Executive Officer. The Authority Chief Executive Officer ensures that Authority

resources are allocated to meet the SSMP goals and objectives, and is ultimately responsible for execution of the *Safety and Security Management Plan* through the Authority Director of Risk Management and the Authority Safety and Security Manager. The Authority Chief Executive Officer chairs the SSEC and reports to the Authority Board of Directors.

3.2.2 Authority Director of Risk Management

The Authority Director of Risk Management reports directly to the Authority Chief Executive Officer and is responsible for identifying, managing and tracking risks and risk mitigation/contingencies, and all responsibilities related to safety and security management on the project, His duties also include maintaining the risk management tool and documentation information, leading risk identification sessions for the project, monitoring prime contractor risk management efforts, and participating in risk management activities for risks that cross project boundaries or are beyond the project's control. He chairs the SSPC and directs active management of all safety and security efforts for the project and reports activities from the SSPC to the SSEC.

3.2.3 Authority Safety and Security Manager

The Authority Safety and Security Manager is responsible for the management of all safety and security activities associated with the development and implementation of the CHSRP. The Authority Safety and Security Manager is a member of the SSPC, SSEC and SSWG, and advises the Authority on policy decisions with regard to safety and security. The Authority Safety and Security Manager reports directly to the Authority Director of Risk Management and coordinates safety activities with the RDP Safety and Security Managers.

The Authority Safety and Security Manager has the authority and responsibility for, but is not limited to the following:

- Ensuring that the SSMP requirements and processes are being implemented and that SSMP goals and objectives are being achieved
- Oversight of the RDP safety and security activities
- Developing corrective action plans (CAPs) that result from accident/incident investigations, hazard analyses, certification of Certifiable Items List (CIL), and safety and security reviews and audits; and tracking corrective actions through closeout to ensure that all identified deficiencies are adequately mitigated or controlled
- Providing oversight for the Contractors' job site safety and programs
- Reviewing and supporting Authority decision for Contractor's safety submittals
- Investigating accidents and incidents on behalf of the Authority
- Reporting unacceptable hazardous conditions to executive management as soon as possible
- Fulfill the role of Chair for the Fire and Life-Safety and Security Statewide Committees

3.3 Rail Delivery Partner Organization

The Authority has engaged a Rail Delivery Partner (RDP) to assist with the management of the delivery of the California High-Speed Rail System. As an integrated member of the Authority's staff the RDP provides technical expertise, advice and support to the Authority with regards to safety and security.

3.3.1 RDP System Safety Manager

The RDP System Safety Manager will support the Authority Safety and Security Manager in the implementation and completion of all safety activities associated with the development of the CHSRP. The RDP System Safety Manager will coordinate safety activities within the RDP and sits on the SSWG, SSPC, SSEC, and Fire and Life-Safety and Security Committees as requested. The RDP System Safety Manager's role on the Committees is to ensure that safety is not compromised by other priorities of the design and construction teams.

The RDP System Safety Manager has the responsibility for, but is not limited to, the following:

- Performing hazard management of CHSRP elements and design criteria to determine any potential hazards that may be created by system development, expansion or modification, and supporting the development of mitigating and controlling factors to address such hazards
- Participating in the project design reviews, including overseeing and administering formal safety and security certification programs
- Working with RDP engineering, operations and maintenance staff to ensure that the system is being designed to safety and security criteria
- Fulfilling the role of Coordinator for the SSPC, the SSWG the Fire and Life-Safety and Security Statewide and Regional Committees
- Supporting Authority outreach efforts to local, regional and State emergency response agencies
- Performing other safety-related activities as requested by the Authority

3.3.2 RDP System Security Manager

The RDP System Security Manager will support the Authority Safety and Security Manager in the implementation and completion of all security activities associated with the development of the CHSRP. The RDP System Security Manager will coordinate security activities within the RDP and sit on the SSPC, SSWG, SSEC, and Fire and Life-Safety and Security Committees as requested. The RDP Security Manager's role on the Committees is to ensure that security requirements are not compromised by other priorities of the design and construction teams.

The RDP System Security Manager has the responsibility for, but is not limited to, the following:

- Performing threat and vulnerability assessments of CHSRP operating environments and design criteria to determine any potential vulnerabilities that may be created by system development, expansion or modification, and supporting the development of mitigating and controlling factors to address such vulnerabilities
- Participating in the project design reviews, including overseeing and administering formal safety and security certification programs
- Working with RDP engineering, operations and maintenance staff to ensure that the system is being designed to safety and security criteria
- Fulfilling the role of Coordinator for the SSEC
- Supporting Authority outreach efforts to local, regional and State emergency response agencies and law enforcement agencies
- Performing other security-related activities as requested by the Authority

3.3.3 RDP Construction Safety Officer

The RDP Construction Safety Officer will support the Authority Construction Manager and Safety and Security Manager in the implementation and completion of all safety activities associated with the construction of the CHSRP.

The RDP Construction Safety Officer has the responsibility for, but is not limited to, the following:

- Oversight of the Project Construction Management (PCM) teams for safety and security activities
- Field audits and inspections of construction activities on behalf of the Authority
- Accident investigation and follow-up
- Development of field safety rules and procedures for Authority and RDP staff

- Training to support Authority and RDP field safety rules and procedures
- Safety Management System data collection, analysis, and documentation

3.3.4 Other RDP Managers

The managers of the following disciplines will be responsible for implementing the SSMP requirements and process in their respective areas, participating in the SSPC and for supporting the Authority Safety and Security Manager as required:

- Engineering, including Infrastructure and Systems
- Operation and Maintenance
- Rolling Stock
- Integration and Regulatory Approvals
- Project Risk
- Contracts and Procurement
- Verification and Validation

3.4 Contract/Procurement Safety and Security

The complexity of the CHSRP necessitates varied approaches to design and constructions for Project elements such as infrastructure, rolling stock, track, and systems. All procurements for project elements, regardless of the procurement type, will contain safety and security requirements that support the safety and security program of the HSR. All contractors will be required to manage their programs consistent with the hazard management approach and certification contained within the Authority's SSMP and other safety and security requirements, such as the Design Criteria Manual Chapter 32.

3.5 Committee Structure

Chapter 2 of the PMP describes the function of various project committees. In addition, safety and security committees listed below will be established to facilitate review of issues and to provide a forum for discussion and resolution.

3.5.1 Safety and Security Executive Committee

The Safety and Security Executive Committee (SSEC) and its members will ensure that the CHSRP is designed, built, and implemented in a safe and secure manner. The SSEC will address safety and security issues that are Authority policy considerations, require Authority approval, require Authority direction for resolution of a dispute, or constitute final acceptance of safety and security certification.

The duties and responsibilities of the SSEC are as follows:

- Provide guidance to and approval of policy decisions with respect to safety and security
- Provide a forum for safety and security discussions among Authority Executive Management, discipline leads, and RDP Management
- Authorize the establishment of the SSPC
- Review and approve regular reports of safety and security activities from the SSPC
- Resolve safety and security issues that cannot be resolved at the SSPC level
- Review and accept a final Safety and Security Certification Report prior to the startup of revenue operations

The SSEC comprises the following persons:

- Chief Executive Officer (Chair)
- Director of Risk Management and Project Controls (Vice-Chair)

- Regional Directors (Northern California, Central Valley, Southern California)
- Chief Program Manager, Rail Operations and Maintenance
- Chief Counsel
- Chief Engineer
- Program Director, Program Delivery
- Chief Administrative Officer
- Safety & Security Risk Manager (advisory role)
- System Safety Manager (advisory role)
- System Security Manager (Committee Coordinator - advisory role)
- Construction Safety and Security Manager (advisory role)

The Chairperson of the SSEC is the Chief Executive Officer or a designated Authority executive management representative. If a designated member of the SSEC is unable to attend a SSEC meeting, they must assign an appropriate representative.

The SSEC Charter, Technical Memorandum 500.02, can be found in Appendix C of this SSMP.

3.5.2 Safety and Security Program Committee

Working at the project delivery level, the Safety and Security Program Committee (SSPC) will ensure that the CHSRP is designed, built, and implemented in a safe and secure manner. The SSPC will achieve this goal by providing oversight of the application of the SSMP through all phases of the CHSRP development and to act as a conduit to informing and assuring Authority executive management (through the SSEC) of safety and security issues affecting the project.

The SSPC will address safety and security issues which are directed to it by the SSEC, require project delivery level resolution, require elevation to the SSEC for Authority direction for resolution, or constitute preliminary review and SONO of Safety and Security Certification.

The duties and responsibilities of the SSPC are as follows:

- Approve the initial version of the SSMP and subsequent updates
- Oversee the application of the SSMP through all CHSRP development phases
- Tracking of identified hazards or vulnerabilities listed on the programmatic Certified Items List
- Provide regular reports of safety and security activities to the SSEC
- Forward to the SSEC for resolution any safety and security issues that cannot be resolved at the SSPC level
- Review Safety and Security Certification Packages and a Final Certification Verification Report for each project phase
- Forward a final Safety and Security Certification Report to SSEC for Authority acceptance at the completion of significant project milestones or phases and prior to the startup of revenue service
- Provide a forum for safety and security discussions among Authority/RDP staff members and a conduit for safety and security issues requiring policy decisions to the Authority's Executive management through the SSEC

The SSPC is made up of the following persons:

- Director of Risk Management and Project Controls (Chair)
- Safety and Security Risk Manager (Vice-Chair)

- System Safety Manager (Committee Coordinator)
- System Security Manager
- Construction Safety and Security Manager
- Director of Operations and Maintenance
- Deputy Director Operations & Maintenance
- Director of Engineering
- Director of Construction Support
- Director of Network Integration
- Rail Systems Manager
- Rolling Stock Manager
- Deputy Regional Directors (Northern California, Central Valley, Southern California)
- Director of Environmental Services
- Director of Real Property

If a designated member of the SSPC is unable to attend a SSPC meeting, they must assign an appropriate representative.

The SSPC Charter, Technical Memorandum 500.03, can be found in Appendix D of this SSMP.

3.5.3 Safety and Security Working Group (SSWG)

The Safety and Security Working Group (SSWG) is the technical group created to assist in application of hazard assessment methodology, evaluation of safety and security design criteria and other technical safety and security requirements. The group consists of safety and security, operations and project delivery staff. Technical safety and security issues are evaluated within the group prior to being forwarded to the SSPC and SSEC.

3.5.4 Fire and Life Safety and Security Committees (FLSSC)

The Fire and Life Safety and Security Committees (FLSSC) will be composed of representatives from fire, police and local building code agencies assigned to two levels of standing committees: a Statewide FLSSC and several regional FLSSC working on a local level. The CHSRP formed the FLSSC during the Preliminary Engineering phase of the project. The purpose of the FLSSC is to provide outreach to local and regional emergency response agencies for issues that are critical to fire and life safety and security, to acquire input and concurrence from the state and local authorities having jurisdiction over the proposed designs to meet code requirements, and to ensure compliance with state and local fire code standards or fire/life safety hazard mitigation measures during the design phase. As the project moves into the Testing and Startup Phase the FLSSC will review operating plans and procedures, results of after-action reviews following major emergency response incidents or exercises, and training programs for content appropriateness and effectiveness.

The Statewide FLSSC will focus on systemic, high-level, fire/life safety and security issues, including federal and state codes or requirements impacting the regional efforts. A goal of the Statewide FLSSC is to obtain concurrence from Federal and State authorities with respect to fire and life safety and security concerns. The Statewide FLSSC will include a representative from each regional FLSSC as well as representatives from Federal and State agencies such as the California Office of the State Fire Marshal, California Highway Patrol, California Office of Emergency Services, CPUC, FRA, and DHS. The Statewide FLSSC will be chaired by the System Safety Manager. Meetings will be held regularly in Sacramento with agendas, minutes, and other support materials supplied by the committee chair. Minutes and action items from the meetings will be conveyed to the regional FLSSCs and to the Safety and Security Program Committee for their consideration

Regional FLSSCs will focus on the CHSRP characteristics specific to their corridor segments (type/length of underground and elevated structures, access methods, terminals, etc.) to provide input with respect to local building codes or requirements that are in line with the emergency response characteristics and capabilities of the local agencies. A goal of the regional FLSSC is to obtain concurrence from local authorities with respect to the proposed designs and the code requirements of the State and Federal authorities having jurisdiction. The regional FLSSC will be composed of appropriate representatives (e.g., Fire Marshal, Police Chief) from local emergency response agencies (fire, police, EMT) and will be chaired by the System Safety and Security Managers or designees. Meetings will be held regularly at a location local to the regional corridor, with agendas, minutes, and other support materials supplied by the committee co-chairs. Minutes and action items from the meetings will be conveyed to the system FLSSC and to the Safety and Security Program Committee for their consideration. One representative from each regional FLSSC will be asked to participate in the system FLSSC. Consistent membership is critical to success. Each regional representative must be the same representative attending to System FLSSC matters and reporting results to their specific Regional Committee.

The FLSSC Charter, Technical Memorandum 500.04, can be found in Appendix E of this SSMP.

3.5.5 Change Control

There are two committees devoted to change control at CHSRA. The first committee, the Change Control Committee (CCC) manages scope, costs and schedule. Another committee or process is being developed to ensure technical changes are tracked and managed.

3.5.6 Rail Activation Committee (RAC)

During construction, a multi-disciplinary rail activation committee will be formed to ensure all elements for rail activation are being managed, including meeting FRA regulatory requirements, safety and security certification and other program requirements. This committee will coordinate planning and process development efforts for the operational testing of the system and eventual startup of revenue service.

3.5.7 System Integration Testing Committee (SITC)

Typically a System Integration Testing Committee (SITC) will coordinate the development of an integrated testing program as a sub-committee to the RAC. If required, the SITC will plan for the effective and efficient testing of subsystems, and then the overall system, including ensuring that as testing progresses mitigations are taken to ensure the safety of the tests. The maturity of the various subsystems will be taken into account prior to full development and assurance that the systems are proven safe. The SITC will be multi-disciplinary in scope and will be established during the latter stages of the Construction Phase.

3.6 Safety and Security Responsibilities Matrix

The requirements, authority, and activities for safety and security will be integrated into the overall project management. At each stage of project advancement, there will be a process in place to ensure that the appropriate parties are aware of their safety and security responsibility associated with the project activity. The Safety and Security Responsibility Matrix (Table 3-1) lists the activities to be performed and assigns the responsibilities from the Preliminary Engineering phase through system Start-up phase.

Table 3-1 Safety and Security Responsibilities Matrix

Key Safety and Security Program Elements	Preliminary Engineering					Final Design					Construction					Testing and Startup				
	SS	PC	EC	CM	CN	SS	PC	EC	CM	CN	SS	PC	EC	CM	CN	SS	PC	EC	CM	CN

P = Primary S = Supporting A = Approval O = Oversight/Audit

4.0 HAZARD MANAGEMENT

4.1 Overview

A hazard is an intentional or unintentional condition or circumstance that has the potential to cause injury, illness, death, damage or loss of equipment or property, or severe environmental damage. Safety hazards (unintentional) or security hazards (intentional) both require management to identify and reduce the risk to the Authority

A risk assessment process for the management of safety and security hazards will be used for the CHSRP. The purpose of the process is as follows:

- Identify and evaluate the effects of hazardous conditions on passengers, CHSRP personnel, CHSRP infrastructure and equipment in order to apply mitigation measures that allow the Authority to achieve an acceptable level of risk.
- Define and evaluate mitigation measures to eliminate or control the identified safety and security hazards.
- Document the development and incorporation of safety and security measures on a Certifiable Items List (CIL) during System development and implementation, demonstrating how an acceptable level of safety and security is to be achieved.

The development of the safety hazard analyses and security risk assessments will be coordinated with the appropriate engineering disciplines for the identification of applicable hazards and recommended control measures. Supporting documentation will be submitted to the SSPC for review. The SSPC will elevate the reports to the Authority, through the SSEC, as appropriate to the processes described in Section 3.4.

Hazard management processes will be applied to the development of the System throughout the entire System life cycle. As the System enters Final Design, the design/build contractors will review and update the CIL for the geographic section under consideration, and work with the Authority to perform or support other analyses as warranted by local or site-specific conditions or designs. Any deviations to the Design Criteria will follow the procedures outlined in section 5.4. Other hazards may be identified during the normal course of work on the development of the CHSRP, including such activities as design reviews, construction inspection and testing, and start-up and integrated testing. Additional hazards or vulnerabilities identified during these activities will also require a hazard analysis or vulnerability assessment to be performed.

The SSPC will be responsible for reviewing and approving all hazard analyses and vulnerability assessments to ensure that significant safety hazards and security threats and vulnerabilities are identified and that the proposed countermeasures adequately resolve the issues. The SSPC will monitor the status of the identified hazards and vulnerabilities from initial identification through final resolution and closure. Sensitive security issues will be tracked on a separate log per the CHSRP SSI Program.

4.2 Risk-Based Safety Hazard Management

Risk-based safety hazard management addresses hazards to the system based upon the amount of risk, both the severity and frequency, posed by the hazard. Hazards that represent higher levels of risk will receive higher levels of resources and analysis.

The risk-based hazard management process is the overall iterative process that comprises:

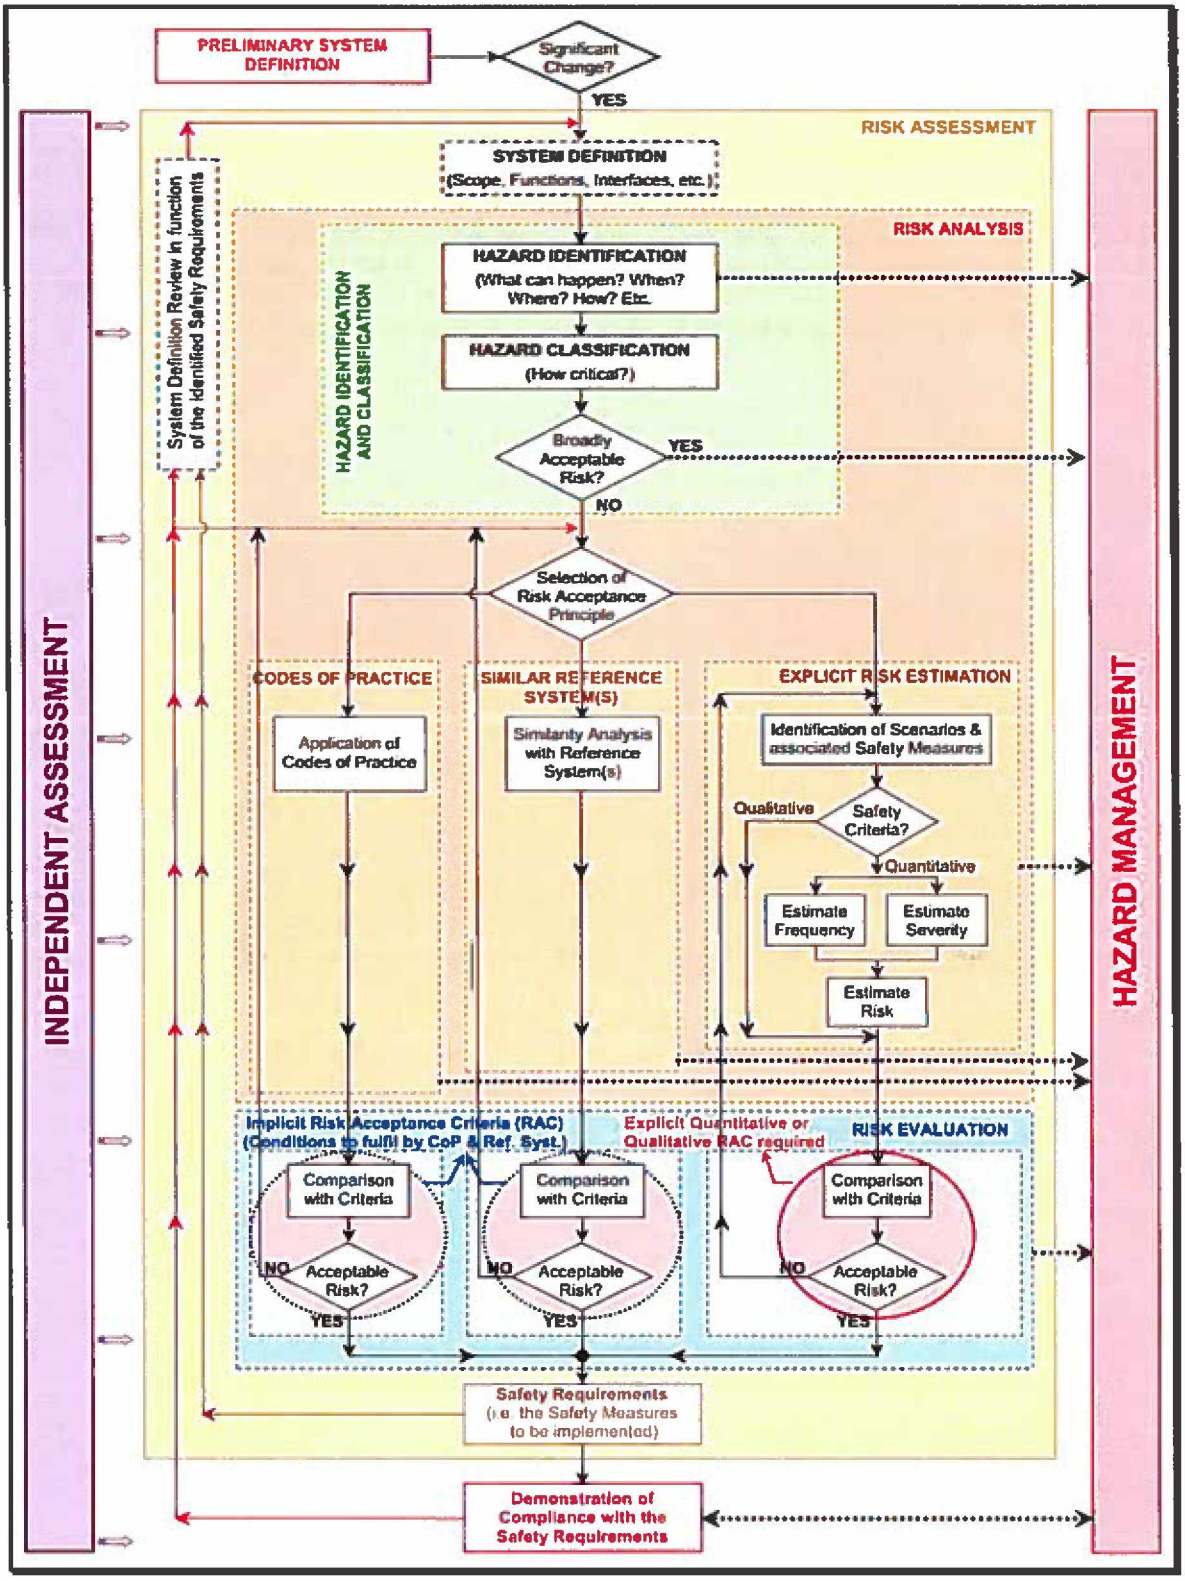
- System definition
- Hazard identification
- Risk analysis
- Accepting residual risk after the application of measures of mitigation
- Verification and validation of implemented hazard management elements

Risk-based hazard management shall be the responsibility of the Authority or its designated representative, but subject to review by an Independent Safety Assessment body (ISA). Risk-based hazard management will begin at the system level and flow-down to sub-system or site-specific levels as appropriate to capture relevant information and sufficient detail to provide appropriate input to the hazard analysis process.

4.2.1 Application of Risk-Based Hazard Management – Common Safety Method

Risk-based hazard management shall be applied to a new system or sub-system and to significant safety-related technical, operational, or organizational changes to the CHSRP using a process called Common Safety Method (CSM). The CSM applied to the CHSRP is based upon the process identified in the European Commission Regulation No. 352/2009 and described in the UK Office of Rail Regulation's (ORR) *Guidance on the Application of the Common Safety Method (CSM) on Risk Evaluation and Assessment*, December 2012. The main phases of the CSM process are illustrated in Figure 4-1. Note that the significant change referenced in Figure 4-1 also implies application to new systems or sub-systems.

Figure 4-1 The Common Safety Method Process



To determine the significance of a new system, sub-system, or change, the following six criteria should be examined:

- Failure consequence: most reasonable credible mishap scenario in the event of failure of the system under assessment, taking into account the existence of safety barriers outside the system
- Novelty used in implementing the change: this concerns both what is innovative in the railway sector, and what is new just for the organization implementing the change
- Complexity of the change
- Monitoring: the inability to monitor the implemented change throughout the system life-cycle and take appropriate interventions
- Reversibility: the inability to revert to the system before the change
- Additionally: assessment of the significance of the change taking into account all recent safety-related modifications to the system under assessment and which were not judged as significant

Guidance on determining significance can be found in SSMP Appendix G *ORR Guidance on the Application of the CSM, Annex 1, December 2012.*

Technical changes are changes to structural and functional railway sub-systems. Technical changes should also be reviewed to determine whether they introduce changes to the operation of the railway sub-system under consideration.

Examples of operational changes include the following:

- Changes to the operation of the CHSRP as a whole
- Changes to the operation of a structural CHSRP sub-system
- Changes to the operating rules of the CHSRP

Changes to the operation of a CHSRP sub-system may be caused by technical changes to that sub-system. In this case, the technical change and its effect on the operation of the CHSRP sub-system, and any changes to the operation or operating rules of the CHSRP, should be assessed together. For example, a change in the wayside signaling may result in increased line capacity. The technical change (new wayside signals) should be assessed together with the operational change (added trains to the line). However, changes to the operation or operating rules of the CHSRP can be introduced without a related technical change. The CSM should be used to assess whether these safety-related changes are significant or not. If they are significant, the CSM should be applied to these changes.

Technical changes to a sub-system can also introduce changes to the operating rules of the railway system. Changes to the operating rules of the CHSRP should be considered together with the technical change, the change to the operation of the affected CHSRP sub-system, and any change to the operation of the CHSRP as a whole.

Organizational changes are changes to the organization of an actor or entity within the CHSRP which could impact on the safety of the CHSRP. The "actor" could be any organization (Authority, contractor, sub-contractor, etc.) that directly affects the safety of the CHSRP. Guidance on organizational changes can be found in SSMP Appendix G *ORR Guidance on the Application of the CSM, Annex 4, December 2012.*

4.2.2 System Definition

The CSM process starts with the system definition. This provides the key details of the new system or the system that is being changed - its purpose, functions, interfaces and the existing safety measures that apply to it. In most cases, the hazards which need to be analyzed will exist at the boundary of the system with its environment. The definition is not static and during iterations of the risk management process, it should be reviewed and updated with the additional safety requirements that are identified by the risk analysis. It,

therefore, describes the condition (or expected condition) of the system before the change, during the change, and after the change.

The system definition shall address at least the following issues:

- System objective, (e.g., intended purpose)
- System functions and elements, where relevant (e.g., human, technical and operational elements)
- System boundary including other interacting systems
- Physical (i.e., interacting systems) and functional (i.e., functional input and output) interfaces
- System environment (e.g., energy and thermal flow, shocks, vibrations, electromagnetic interference, operational use)
- Existing mitigation measures and definition of the safety requirements identified by the hazard risk assessment process
- Assumptions that shall determine the limits for the hazard risk assessment

The system definition needs to cover not only normal mode of operations but also degraded or emergency mode.

Consideration of interfaces should not be restricted to physical parameters, such as interfaces between wheel and rail. It should include human interfaces, for example the user-machine interface between the locomotive engineer and displays in the cabs of rail vehicles. It should also include interfaces with non-railway installations and organizations, for example, the interface with underground utilities.

Operational procedures and rules, and staff competence should be considered as part of the system environment in addition to the more usual issues such as weather, electromagnetic interference, local conditions such as lighting levels, etc. The system definition is complete and sufficient if it describes the system elements, boundaries and interfaces, as well as what the system does.

The description can effectively serve as a model of the system and should cover structural issues (how the system is constructed or made up) and operational issues (what it does, and how it behaves normally and in failure modes). The existing safety measures, which may change as the risk assessment process progresses, can be added after the structural and operational parts of the model are complete.

The Hazard Assessor may not know all the environmental or operational conditions in which the altered or new system will operate. In these circumstances, they should make assumptions on the basis of the intended or most likely environment. These assumptions will determine the initial limits of use of the system and should be recorded. When the system is put into use, the Hazard Assessor (who may be different to the original proposer) should review the assumptions and analyze any differences with the intended environmental and operational conditions.

4.2.3 Hazard Identification and Classification

The Authority shall systematically identify, using wide-ranging expertise from a competent team, all reasonably foreseeable hazards for the whole system under assessment, its functions where appropriate, and its interfaces. Scope of hazards shall be limited to those hazards that directly or indirectly affect the safety of passengers, employees, rolling stock, and facilities of the CHSRP. All identified hazards shall be registered in the CIL.

The purpose of the hazard identification is to identify all reasonably foreseeable hazards which are then analyzed further in the next steps.

The hazard identification should be systematic and structured, which means taking into account factors such as the following:

- The boundary of the system and its interactions with the environment

- The system's modes of operation (i.e., normal/degraded/emergency)
- The system life cycle including maintenance
- The circumstances of operation (e.g., proximity to freight-only line, tunnel, bridge, etc.)
- Human factors
- Environmental conditions
- Relevant and foreseeable system failure modes

Relevant tools for hazard identification include structured brainstorming, checklists, task analysis, operations analysis, preliminary hazard analysis, and failure modes and effects analysis. Whichever technique is used, it is important to have the right mixture of experience and competence while maintaining impartiality and objectivity. Correct hazard identification will underpin the whole risk assessment process and give assurance that the risks will be managed in the project.

Preliminary Hazard Analysis (PHA) shall be performed in order to identify an initial risk index for hazard classification and to form a basis for risk acceptance. Development of the PHA involves identifying the severity of consequence and frequency of occurrence before the application of mitigation measures, using the risk estimation process and risk acceptance criteria identified in Section 4.2.5.

Development of the PHA will allow classification of the hazard as broadly acceptable or not. Based on expert judgment, hazards associated with a broadly acceptable risk need not be analyzed further but shall be registered in the CIL. In this context, 'broadly acceptable' applies to those hazards where the risk is essentially insignificant or negligible. Their acceptable classification shall be justified in order to allow acceptance by the Authority.

The level of detail of the hazard identification depends on the system that is being assessed and needs to be sufficient to ensure that relevant safety measures can be identified. If it can be successfully demonstrated that a hazard can be controlled by application of one of the three risk assessment principles identified in the CSM, following high-level hazard identification, then no further hazard identification is necessary. If it is not possible to have sufficient confidence at this stage, then further analysis of the causes of these high level hazards is undertaken to identify relevant measures to control the risks arising. The risk assessment process continues until it can be shown that the overall system risk is controlled by one or more of the risk assessment principles.

Hazard identification is still necessary for those systems/sub-systems/changes where the hazards are controlled by the application of codes of practice or by comparison to reference systems. Hazard identification in these cases will serve to check that all the identified hazards are being controlled by relevant codes of practice or by adopting the safety measures for an appropriate in-use system. This will also support mutual recognition and transparency. The hazard identification can then be limited to verification of the relevance of the codes of practice or reference systems, if these completely control the hazards, and identification of any deviations from them. If there are no deviations, the hazard identification may be considered complete.

During the hazard identification, mitigation measures may be identified as well. Potential mitigation measures shall be registered in the CIL.

The hazard identification only needs to be carried out at a level of detail necessary to identify frequency and severity of the hazard, plus potential mitigations. Development of sub-system analysis may be necessary until a sufficient level of detail is reached for the identification of hazards.

4.2.4 Risk Analysis

The risk acceptability of the system under analysis shall be established by following this hierarchy of CSM Risk Acceptance Principles:

1. The application of codes of practice (Section 4.2.4.1)
2. A comparison with reference systems (Section 4.2.4.2)

3. Explicit risk estimation (Section 4.2.4.3)

More than one of these risk acceptance principles may be applied in concert. The Hazard Assessor shall demonstrate in the risk evaluation that the selected risk acceptance principle is adequately applied. The Hazard Assessor shall also ensure that the selected risk acceptance principles are used consistently. The Authority is ultimately responsible for approving the risk evaluation efforts of the Hazard Assessor and accepting the residual risk associated with the identified hazard or vulnerability.

Whenever a code of practice or a reference system is used to control the risk, the hazard identification must also include the following:

- The verification of the relevance of the code of practices or of the reference system
- The identification of the deviations from the code of practices or from the reference system

The application of CSM Risk Acceptance Principles shall identify possible mitigation measures that make the risk(s) of the system under assessment acceptable. Among these mitigation measures, the ones selected to control the risk(s) shall become the safety requirements to be fulfilled by the system. Compliance with these safety requirements shall be demonstrated in accordance with the Verification and Validation and Safety and Security Certification Program requirements identified in Chapter 7 of this SSMP.

Mitigation measures shall be applied in accordance with the *Prevention through Design* principle as detailed in Section 5.1. The *Prevention through Design* principle includes the following elements in order of precedence:

1. Avoidance
2. Elimination
3. Substitution
4. Engineering Controls
5. Warnings
6. Administrative Controls such as Operations and Maintenance Procedures
7. Personal Protective Equipment and Guards

Unacceptable risk will be reduced to an acceptable level before design acceptance. Undesirable risk must be reduced where reasonably practicable, and an Authority decision is required to accept the residual risk of the hazard or dispose of the system. The hazards will be reviewed by the SSPC, with recommendation made to the SSEC for decision. Acceptance of the level of risk or disposal of the system will be provided by the Authority through the SSEC. Tolerable risk can be tolerated and accepted with adequate controls, although risk-reducing mitigations must be applied where reasonably practicable. The iterative risk assessment process can be considered as completed when it is demonstrated that all safety requirements are fulfilled and no additional reasonably foreseeable hazards have to be considered.

As a criterion, risks resulting from hazards may be classified as acceptable when the risk is so small that it is not reasonable to implement any additional safety measure. The expert judgment shall take into account that the contribution of all the broadly acceptable risks does not exceed a defined proportion of the overall risk.

Individual hazards can be closed out by the application of one of the three principles, but it is likely that for most major projects a combination of the three principles will be used. Any risk assessment conducted under the CSM should always be proportionate to the extent of the risk being assessed. The CSM has been introduced to ensure that levels of safety are maintained or improved when and where necessary and reasonably practicable. Applying one or more of the three risk acceptance principles correctly for all identified hazards means that the risk has been reduced to an acceptable level. No further evidence is required to show that the residual risk is acceptable.

4.2.4.1 Application of Codes of Practice

The Authority shall analyze whether one or several hazards are appropriately covered by the application of relevant codes of practice.

The codes of practice shall satisfy at least the following requirements:

- Be widely acknowledged in the passenger rail industry. If this is not the case, the codes of practice will have to be justified and be acceptable to the Authority.
- Be relevant for the control of the considered hazards in the system under assessment.
- Be publicly available.

If one or more hazards are controlled by codes of practice fulfilling the requirements of points above, then the risks associated with these hazards shall be considered as acceptable. This means that these risks need not be analyzed further, however the use of the codes of practice shall be registered in the CIL as safety requirements for the relevant hazards.

The PHA form developed during the hazard identification phase shall be completed with the term "acceptable" in the Resolution column. It will not be necessary to identify a final risk index.

Standards and rules that are widely accepted in the passenger rail sector include the following:

- Federal Railroad Administration regulations found in 49 CFR, Parts 200-299
- Federal Transit Administration regulations
- AREMA Standards for track
- California Public Utilities Commission General Orders
- TSIs or other mandatory European standards and norms
- Standards issued by the American National Standards Institute (ANSI)

This list is not exhaustive. It is also possible to use standards or codes of practice from other sectors (for example aviation, maritime, etc.) but these have to be justified and be acceptable to the ISA.

Deviations from codes of practice are possible where the Hazard Assessor can demonstrate that at least the same level of safety will be achieved. Mandatory standards such as FRA regulations often include a process for deviating from them. Most non-mandatory standards do not have a process for deviating from them. If one or more conditions of the code of practice are not fulfilled, the Hazard Assessor may have to conduct explicit risk estimation on those hazards where the code of practice is not relevant for the control of the hazards in the system under assessment. Alternatively, other codes of practice or reference systems could be used. Where an alternative approach is not fully compliant with a code of practice, the Hazard Assessor shall demonstrate that the alternative approach taken leads to at least the same level of safety.

If the risk for a particular hazard cannot be made acceptable by the application of codes of practice, additional mitigation measures shall be identified applying one of the two other risk acceptance principles.

When all hazards are controlled by codes of practice, the hazard management process may be limited to the following:

- The hazard identification and classification in accordance with Section 4.2.3
- The registration of the use of the codes of practice in the CIL
- The documentation of the hazard management process in accordance with Section 4.2.7

4.2.4.2 Use of a Reference System

The Authority, with the support of other involved actors, shall analyze whether one or more hazards are covered by a similar system that could be taken as a reference system. Reference systems can be used to derive the safety requirements for the new or changed system.

A reference system shall satisfy at least the following requirements:

- It has already been proven in-use to have an acceptable safety level and would still qualify for approval by the regulatory body having jurisdiction.
- It is accepted by the body having regulatory authority over its application to CHSRP (e.g., FRA, CPUC, Office of State Fire Marshal, etc.).
- It is used under similar functional, operational, and environmental conditions and has similar interfaces as the system under consideration for CHSRP.

For technical changes, it is unlikely that evidence of in-service history alone can prove that a high integrity system has an acceptable safety level, given the low failure rates required of such systems. Evidence that sufficient safety engineering principles have been applied in the development of the reference system will need to be confirmed for each application of it.

If a reference system fulfills the requirements listed above, then for the system under assessment the risks associated with the hazards covered by the reference system shall be considered as acceptable.

If the system under assessment deviates from the reference system, the risk evaluation shall demonstrate that the system under assessment reaches at least the same safety level as the reference system. The risks associated with the hazards covered by the reference system shall, in that case, be considered as acceptable.

If the same safety level as the reference system cannot be demonstrated, additional mitigation measures shall be identified for the deviations, applying one of the two other risk acceptance principles.

The safety requirements for the hazards covered by the reference system may be derived from the safety analyses or from an evaluation of safety records of the reference system. These safety requirements shall be registered in the CIL as safety requirements for the relevant hazards.

The PHA form developed during the hazard identification phase shall be completed with the term "acceptable" in the Resolution column. It will not be necessary to identify a final risk index.

When hazards are accepted by use of a reference system, the hazard management process may be limited to the following:

- The hazard identification and classification in accordance with section 4.2.3
- The registration of the use of the reference system in the CIL
- The documentation of the hazard management process in accordance with Section 4.2.7

4.2.4.3 Explicit Risk Estimation

Explicit risk estimation is an assessment of the risks associated with hazard(s), where risk is defined as a combination of the likelihood (or frequency of occurrence) and the consequence (or severity) of a hazard. Explicit risk estimation can be used where:

- The Authority is unable to address the hazards identified in the hazard identification stage of the CSM via a code of practice or comparison with a reference system;
- Deviations are necessary from codes of practice or reference systems; or
- The Authority needs to analyze the hazards and evaluate design principles or safety measures.

The estimation can be qualitative, semi-quantitative, or quantitative. The choice will be determined by factors such as availability of, and confidence in, quantitative data; the depth of analyses should be proportionate to the potential risks. Any risk assessment should follow a systematic and structured process. Qualitative hazard assessment shall be performed by technical experts with sufficient experience and qualifications relevant to the hazard under consideration.

The acceptability of the estimated risks shall be evaluated using the risk acceptance criteria identified in Section 4.2.5. The acceptability of the risk may be evaluated either individually for each associated hazard or globally for the combination of all hazards considered in the explicit risk estimation.

If the estimated risk is not acceptable, additional mitigation measures shall be identified and implemented in order to reduce the residual risk to an acceptable level. The ALARP Principle (As Low as Reasonably Practicable) shall be applied to compare the cost and feasibility of applying additional mitigation measures against the benefit gained from reduced residual risk.

When hazards are accepted by use of explicit risk estimation, the hazard management process may be limited to the following:

- The hazard identification and classification in accordance with section 4.2.3
- Completion of the PHA process by registering the risk index in the Residual Risk Index (Projected) column of the PHA form
- The registration of the use of the explicit risk estimation and the mitigation measures in the CIL; and
- The documentation of the hazard management process in accordance with Section 4.2.7.

When the risk associated with one or a combination of several hazards is considered as acceptable, the identified mitigation measures shall be registered in the CIL.

Where hazards arise from failures of technical systems not covered by codes of practice or the use of a reference system, the following risk acceptance criterion shall apply for the design of the technical system:

- For technical systems where a functional failure has credible direct potential for a catastrophic consequence, the associated risk does not have to be reduced further if the failure rate of that system is less than or equal to 10^{-9} failures per operating hour.

The explicit risk estimation and evaluation shall satisfy at least the following requirements:

- The methods used for explicit risk estimation shall reflect correctly the system under assessment and its parameters (including all operational modes).
- The results shall be sufficiently accurate to serve as robust decision support, i.e., minor changes in input assumptions or prerequisites shall not result in significantly different requirements.

4.2.5 Risk Estimation Process and Risk Acceptance Criteria

The risk assessment process for significant hazards is as follows:

1. Identify the hazardous event(s) that have the potential to cause injury or death to passengers, employees, or members of the public who are directly or indirectly exposed to the technical, operational, or organizational change being considered.
2. Identify the precursors (i.e., the component, sub-system or system failures, physical effects, human error failures or operational conditions) that can result in the occurrence of each hazardous event.
3. Identify the control measures that are in place to control or limit the occurrence of each precursor that cannot be eliminated.
4. Estimate the frequency at which each hazardous event can occur.
5. Estimate the consequences (most reasonable credible mishap) in terms of injuries and fatalities, environmental impact, monetary loss, or reputational damage that could occur for the different outcomes that may follow the occurrence of a hazardous event.
6. Estimate the overall risk associated with the hazardous event.

7. Identify additional mitigations or control measures that, if applied, would ensure that residual risk is reduced so far as is reasonably practicable.
8. Provide clear and comprehensive documentary evidence of the methodologies, assumptions, data, judgments, and interpretations used in the development of the risk assessment and the analysis of its results. Particularly where the assessment is quantitative and where different safety measures need to be assessed, the results may also need to be accompanied by sensitivity and uncertainty analysis.

The severity category and frequency of occurrence of the potential mishap(s) for each hazard across all system modes are estimated using the definitions in Table 4-1 and Table 4-2 respectively.

Table 4-1 Hazard Severity Categories

Hazard Category	Definition

1
Catastrophic
	Could result in one or more of the following:
	• Multiple fatalities or equivalent fatalities
	• Irreversible significant environmental impact
	• Monetary loss equal to or exceeding $10M
	  ○ Severe damage or total loss of rolling stock
	  ○ Severe damage to infrastructure or other severe system loss causing all or a significant portion of the system to be unavailable for normal service for more than 72 hours
	• Reputational damage of national impact

2
Critical
	Could result in one or more of the following:
	• A single fatality or multiple major injuries or occupational illnesses
	• Reversible significant environmental impact
	• Monetary loss equal to or exceeding $1M but less than $10M
	  ○ Major but repairable damage to rolling stock
	  ○ Major damage to infrastructure or other major system loss, repairable within 72 hours to allow normal service
	• Reputational damage of statewide impact

3
Marginal
	Could result in one or more of the following:
	• A major injury or occupational illness, or multiple minor injuries
	• Reversible moderate environmental impact
	• Monetary loss equal to or exceeding $100K but less than $1M
	  ○ Minor repairable damage to railcars
	  ○ Minor damage to infrastructure or other minor system loss, repairable within 24 hours to allow normal service
	• Reputational damage of local area impact

4 **Negligible**	Could result in one or more of the following: • A minor injury or occupational illness • Minimal environmental impact • Monetary loss less than $100K ○ Minimal infrastructure damage or system loss affecting normal service for less than 12 hours • Reputational damage of limited or little impact

To determine the appropriate severity category as defined in Table 4-1 for a given hazard at a given point in time, identify the potential for death or injury, environmental impact, monetary loss, or reputational damage in a most reasonable credible mishap scenario. A given hazard may have the potential to affect one or all of these areas. An equivalent fatality may be expressed as 10 major injuries (those requiring hospitalization) or 100 minor injuries (those not requiring hospitalization).

Hazard frequency is defined as the likelihood that a specific hazard will occur during the planned life-cycle of the system element, subsystem, or component, recognizing that these life-cycles will vary depending upon the item under consideration. Hazard frequency can be described subjectively in potential occurrences per unit of time (Mean Time to Hazardous Event – MTTHE), events, population, items, or activity, and shall be ranked as shown in Table 4-2.

Table 4-2 Hazard Frequency Categories

Description	Level	Qualitative Definition	Qualitative Description for the System	Quantitative Context (Probability of Occurrence)
Frequent	A	Likely to occur frequently in an individual item or the System; may be continuously experienced in fleet/inventory.	MTTHE < 2 months	$p > 10^{-1}$
Probable	B	Likely to occur several times in the life of an individual item or the System; will occur frequently in fleet/inventory.	2 months < MTTHE < 1 year	$10^{-1} > p > 10^{-2}$
Occasional	C	Likely to occur sometime in the life of an individual item or the System; will occur several times in fleet/inventory.	1 year < MTTHE < 10 years	$10^{-2} > p > 10^{-3}$
Remote	D	Unlikely but possible to occur in the life of an individual item or the System; unlikely but can be expected to occur in fleet/inventory.	10 years < MTTHE < 100 years	$10^{-3} > p > 10^{-6}$
Highly Unlikely	E	So unlikely that it can be assumed occurrence may not be experienced in the life of an individual item or the System; unlikely but possible to occur in fleet/inventory.	MTTHE > 100 years	$10^{-6} > p$
Eliminated	F	Incapable of occurrence. This level is used when potential hazards are identified and later eliminated.	n/a	$p = 0$

Note - Frequency level F is used to document cases where the hazard is no longer present. No amount of doctrine, training, warning, caution, or Personal Protective Equipment (PPE) can move a mishap frequency to level F.

The frequency of the hazard can be determined qualitatively based on the relative frequency of expected occurrence, or quantitatively (using failure rates or accident/incident statistical data). Quantitative determination is generally preferable, but in the absence of applicable quantitative data the use of qualitative estimation is necessary and appropriate. Table 4-2 identifies both a qualitative definition and a qualitative description of the system using MTTHE, based upon a railway operation 20 hours per day, 7 days per week.

Hazard severity categories (1 through 4) and hazard frequency categories (A through E) are combined in the Risk Assessment Matrix (Table 4-3) to produce a risk index for each identified hazard. The Risk Acceptance Matrix (Table 4-4) identifies required actions to reduce risk based on the risk rating. The Authority will accept the residual risk through the Safety and Security Executive Committee process (where appropriate) through direct approval of individual risk acceptance decisions for hazard risks categorized as

Undesirable. Hazard risks categorized as *Acceptable* do not require direct SSEC approval, however review of the risk assessment process will fulfill the Authority's responsibility to accept the residual risk.

Table 4-3 Risk Assessment Matrix

Frequency \ Severity	1 Catastrophic	2 Critical	3 Marginal	4 Negligible
(A) Frequent	1A	2A	3A	4A
(B) Probable	1B	2B	3B	4B
(C) Occasional	1C	2C	3C	4C
(D) Remote	1D	2D	3D	4D
(E) Highly unlikely	1E	2E	3E	4E
(F) Eliminated				

Table 4-4 Risk Acceptance Matrix

Hazard Risk Index	Risk Rating	Action Required
1A, 1B, 1C, 2A, 2B, 3A	Unacceptable	Risk must be reduced and managed
1D, 2C, 2D, 3B, 4A	Undesirable	Risk is acceptable only where further risk reduction is impracticable. Authority decision at the SSEC level is required to accept residual risk.
1E, 2E, 3C, 3D, 4B	Tolerable	Apply mitigations where reasonably practicable. Risk can be tolerated and accepted with adequate controls. Authority review at the SSPC level is required to accept residual risk.
3E, 4C, 4D, 4E	Acceptable	No further risk reduction required
	Eliminated	None

4.2.6 As Low as Reasonably Practicable (ALARP Principle)

The ALARP Principle shall be applied as necessary to assess the cost/benefit of applying additional measures of mitigation in order to achieve residual risk that is as low as reasonably practicable. ALARP calculations can be qualitative, semi-quantitative, or quantitative depending on the level of risk and the amount of data available to the assessor. Qualitative analysis is entirely appropriate for assessment of risks that are found in standard industry practice or common experiences. Hazards deemed appropriate for more quantitative analysis will require development of more comprehensive analysis to provide the required level of data. Criteria for applying a detailed, quantitative cost/benefit analysis includes high risks that must be mitigated and accepted, highly-controversial risks, risks with a potentially high impact to the System or project under consideration.

The ALARP principle considers the fact that infinite time, effort and money could be spent on the attempt of reducing a risk to zero, but doing so is usually not practical. The principle is not simply a quantitative measure of benefit against detriment; it is more accurately a best common practice of judgment of the balance of risk and societal benefit. ALARP does not represent zero risk.

For a risk to be ALARP it must be possible to demonstrate that the cost involved in reducing the risk further would be grossly disproportionate to the benefit gained; that is the greater the risk, the more resources that should be spent in reducing it, and the greater the bias on the side of safety. The costs could marginally outweigh the benefits and yet the measure could still be reasonably practicable to introduce in order to reduce risk.

The disproportion factors (DF) in Table 4-5 shall be applied to the ALARP process according to the amount of risk. DFs that may be considered gross vary from upwards of 1 depending on a number of factors including the magnitude of the consequences and the frequency of realizing those consequences, i.e., the greater the risk, the greater the DF.

Table 4-5 Disproportion Factors for Risk

Risk Rating	DF
Unacceptable	10
Undesirable	8
Tolerable	5
Acceptable	1

When using a cost/benefit analysis, convert both the additional mitigation(s) and the risk (so far as it is being reduced) to a common set of units (dollars) for the purpose of making a comparison. A hazard is considered ALARP using a cost/benefit analysis when cost divided by the benefit is greater than the DF.

Other issues to consider when performing a cost/benefit analysis include the sensitivity of key inputs (frequency/severity of the hazardous event), animalization (average costs and average benefits), and discounting the value of future benefits.

4.2.7 Hazard Analysis Processes and Documentation, Verification and Validation

A variety of hazard analysis processes are available for proper risk estimation and mitigation development, based upon the characteristics of the system or subsystem under consideration. The types of analyses that may be required for the development of the CHSRP are described below.

- Preliminary Hazard Analysis (PHA) is typically the initial hazard analysis technique used during the system or subsystem design phase. PHA is used to identify safety critical areas within the system and roughly evaluate hazards. PHA establishes the basis for the safety criteria in design, equipment, and performance specifications.
- Site-Specific Hazard Analysis (SiSHA) is an expansion of the PHA, conducted as the general design criteria and system requirements are applied to specific system and subsystem elements. An example would be a SiSHA for an elevated structure spanning the SR-99 highway in Fresno, applying the safety-critical criteria found in the

Design Criteria to the specific characteristics and site conditions of this structure. SiSHA is generally performed during the Final Design, Construction, and Testing/Startup Phases. The primary output of the SiSHA is the identification and evaluation of hazards and mitigations that are specific to the system element under consideration.

- Failure Modes and Effects Analysis (FMEA) is an inductive analysis used to identify equipment failures. It evaluates a system or subsystem to identify possible failures of each individual component in the system. The results or effects of the subsystem and component failures are then classified according to severity.
- Fault Tree Analysis (FTAn) is representative of the deductive process. The purpose of the Fault Tree Analysis is to provide a concise and orderly description of the various combinations of possible occurrences within the system that can result in an undesired event. This is the most rigorous of the hazard identification processes and analyses and is typically performed for the most complex systems.
- Interface Hazard Analysis (IHA) is performed to identify design hazards in components and subsystems of a major system as they relate to other components or subsystems. IHA determines the functional relationships between the systems, subsystems, processes, components and equipment based solely on safety considerations and also identifies all elements in which a functional failure could result in a hazardous condition or accidental loss.
- Operating Hazard Analysis (OHA) is performed to determine all applicable operational safety requirements for personnel, procedures, and equipment throughout all phases of the system life cycle. Engineering data, procedures, and instructions developed from other safety analyses, the engineering design, and initial test programs are used to support this analysis.
- Software Hazard Analysis (SHA) will be used to evaluate software design, related software, and hardware documentation for safety-critical software-controlled functions. The analysis will review software and hardware failures that could cause the system to operate in a hazardous manner.
- Adjacent Railroad Hazard Risk Assessment Model (ARHRAM) will be used to assess the hazards associated with freight railroad right-of-ways directly adjacent to the CHSRP right-of-way This is a semi-quantitative assessment process that relies on input from technical experts to assess site-specific characteristics of the adjacent railway.
- Adjacent Roadway Vehicle Hazard Risk Assessment Model will be used to assess hazards associated with roadway vehicles traveling directly adjacent to the CHSRP right-of-way. This is a semi-quantitative assessment process that relies on input from technical experts to assess site-specific characteristics of the adjacent roadway.

The detailed process for completing each of these analysis types, including the appropriate forms, is identified in SSMP Appendix G. Appropriate support documentation used in the development of risk assessment will be identified or referenced in detail as part of each analysis process, including, but not limited to, the following:

- System description including modes of operation and tasks
- Schematics, drawing, block diagrams, lists of assemblies, parts and components addressed within each subsystem and system
- Documented reliability and safety data including failure rate data obtained from service use in identical or manifestly similar equipment in similar environment
- Documented reliability and safety data obtained from formal test results, conducted in similar applications

- Documented reliability and safety data obtained from formal analyses, conducted for equipment in similar applications
- Hazard management requires monitoring and documentation throughout the project life cycle. Verification and validation activities shall fulfill the requirements of the Safety and Security Certification Program, as described in Section 7 of this SSMP.

4.3 Security Risk Assessment Process

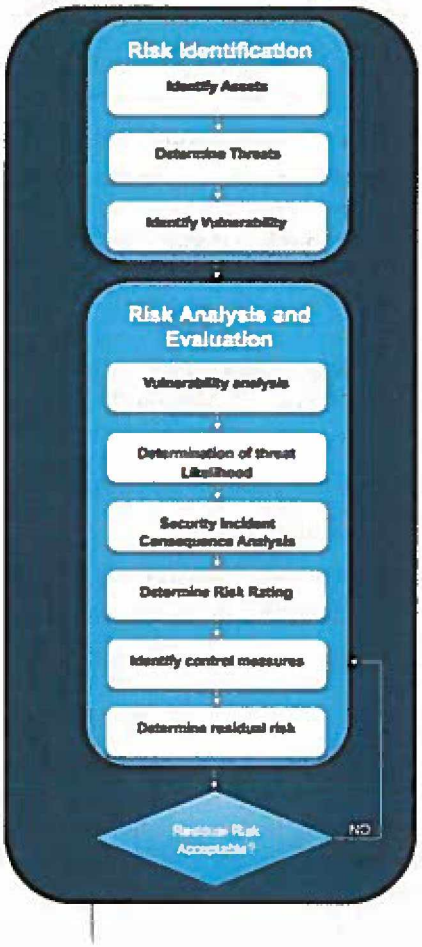
Planning in advance of day-to-day passenger rail crimes, terrorist acts, or other security incidents is essential to providing CHST passengers and employees with a safe and secure environment. A breach in security may result in serious injuries or death, destruction of property and facilities, and/or the inability to continue CHSRP operations to the region.

Adopting a methodology that involves periodic assessment is consistent with the requirement of the system security lifecycle and ISO 31000 Risk Management standard.

In order to ensure that the Authority has considered security risks, such as crime or acts of terrorism, it is crucial to apply a methodological approach and process to security risk management. The risk assessment process that will be used (and as illustrated in Figure 4-2) includes the following:

- Identify the key assets
- Identify the threats
- Identify the vulnerabilities
- Identify the likelihood
- Identify the consequence/impact
- Assign the initial risk index as the basis for future risk decision criteria
- Identify potential mitigation measures/countermeasures
- Determine residual risk after implementation of countermeasures

Figure 4-2 Security Risk Assessment Process



To evaluate the susceptibility to potential threats and to design corrective actions that can reduce or mitigate the risk of serious consequences from a security incident, a Threat and Vulnerability Assessment (TVA) will be initiated during the preliminary phases of the CHSRP. The assessment will be reviewed and updated at each subsequent phase.

The TVA process will identify the likelihood of specific threats that may endanger railroad assets (people, property, and information); the potential vulnerabilities associated with the design of the CHSRP; and mitigation efforts that can be designed into the CHSRP to reduce the risk and to minimize the consequences of identified potential criminal and terrorism activities. It will also identify future security training needs of transit personnel and the necessity for security procedures. The Security Risk Assessment will be protected under Sensitive Security Information (SSI) and shared *only* with those persons with a need to know.

4.3.1 Assets

4.3.1.1 Identification

Assets are defined as people and property. System assets include the following:

- People – passengers, employees, visitors, contractors, vendors, surrounding communities, and others who come into contact with the transit system
- Property – fixed infrastructure, rolling stock, software
- Information – plans, procedures, network information, passwords and access codes

Assets associated with the CHSRP will be identified during the TVA process and included as a listing in the Threat and Vulnerability Assessment Report.

4.3.1.2 Criticality Determination

Assets will be prioritized in terms of criticality. Most weight will be given to those assets that present the greatest threat to life safety or service disruption. In making this determination, consideration will be given to the following:

- Impact on CHSRP passengers, employees, and first responders
- Impact on CHSRP operations
- Economic value of the asset, including current and replacement value
- Intrinsic value of the asset to a potential adversary
- Asset location relative to other critical assets

4.3.2 Identification of Threats

Threats are defined as deliberate actions intended to cause injury or death to people or damage or loss of critical assets. The threats (or attack types) to the CHSRP will generally be the same as those faced by other public transportation networks. Threat is the combination of both intent and capability of a threat actor or threat source to realize a threat or attack against an asset. It is possible to separately analyze the intent and the capability but this type of analysis requires specific information and intelligence about specific threat actors.

As part of the security risk management system it is important to understand target attractiveness. Target attractiveness varies depending upon threat actor motivations and goals, but in general the following criteria are useful in determining the potential for target selection:

- Potential for public impact, damaging the society and ecosystem as a whole
- Lack of target protection and does the target follow predictable patterns
- Potential for mass casualties
- Potential for global significance or visibility to either the threat actor or the target
- Target permanently or frequently available
- Potential for major political or economic impact
- Potential for economic gain
- Ease of accessibility
- Perceived "iconic" status

Determination of security threat is always evolving and requires analysis to be based on the past performance of threat actors, both successful and attempted. Historical data (from reliable open source information) of manifested threat events across national and international transit systems provides accurate data to enable security threats to the CHSRP assets and systems to be established.

A series of tables illustrate examples of threat categories (Table 4-6), crime categories (Table 4-7), and threat types (Table 4-8).

Table 4-6 Threat Category Examples

Threat Category	Sources
Criminal	Petty crime Organized crime Current/former staff
Terrorism	Domestic extremist groups Transnational extremist groups Single-issue groups
Hostile State	Military State-sponsored hostile actors

Table 4-7 General Crime Categories and Examples

Threat Category	Crime Types within Category
Crimes against Persons	Assault, homicide, robbery, theft
Crimes against Property	Arson, cargo theft, vandalism, burglary
Other Crimes committed on Transit Property	Organized crime presence – infiltrating rail system, using rail system to move contraband, drugs, prostitution, fare evasion, trespass

Table 4-8 Threat or Attack Types Examples

Threat Type	Types within Category
Explosives	Military explosive, improvised explosive device (IED), vehicle-borne improvised explosive device (VBIED), personnel-borne improvised explosive device (PBIED)
Chemical	Toxic industrial chemicals, and poisons
Arson	Incendiary Devices
Small Arms Attack	Use of standard firearms and other weapons
Standoff Attack	Weapons with high-energy explosives that are designed to hit and penetrate heavily protected objects from a distance.
Cyber Attack	Viruses, Worms and Trojan Horses
Hoax Call or Device	Intentional false alarm or threat

As stated previously, threat is based upon the combination of intent and capability. Table 4-9 provides the threat rating matrix and Table 4-10 provides the threat ratings and their descriptions.

Table 4-9 Threat Rating Matrix (Intent x Capability)

INTENT	CAPABILITY				
	Similar exploit has been used	Operational capability confirmed by credible evidence	Some evidence that operational capability exists; not confirmed	No evidence of operational capability but feasibility confirmed	No evidence and even feasibility unconfirmed
Tactic has been used in the past and a similar attack may be planned	Very High	Very High	High	Medium	Low
Tactic has been used before and it is credible that it is being considered for further use	Very High	High	High	Medium	Low
Tactic has not been used before but is under consideration	High	High	Medium	Medium	Low
Tactic has not been used before but it may be under consideration	Medium	Medium	Medium	Low	Very Low
Tactic has not been used before and is not known to be under consideration	Low	Low	Low	Very Low	Very Low

Table 4-10 Threat Rating and Definitions

Threat Rating	Threat Rating Definition
VERY HIGH	Significant and proven threat present based upon demonstrated intent and demonstrated capability
HIGH	Threat present based upon stated/demonstrated intent with demonstrated capability.
MEDIUM	Medium level threat exists based upon either strong intent or some degree of stated/demonstrated capability.
LOW	General threat exists and should be monitored – no proven intent or demonstrated capability
VERY LOW	General threat may exist with intent and capability feasibility unconfirmed

For purposes of the CHST System, threat of terrorist activity will be based on information provided by DHS/TSA and other credible sources. For other threats, including crime and quality of life incidental threats, the Security Risk Assessment will review crime data provided by law enforcement in the adjacent areas, and open source data of criminal threats for other rail systems.

4.3.3 Scenario Analysis

Scenarios are the outcome of pairing specific assets with specific threats. An explosive device at a rail station provides a scenario that can be evaluated to identify the vulnerabilities that may make the rail station, an identified asset, susceptible to an attack. Scenario development also identifies impacts of threats on

critical assets and promotes mitigation strategies and capability needs. The scenarios are intended to represent credible, real-world events and, as such, will be derived primarily from other operating systems' experiences, FTA and TSA resource documents, and local crime report information.

4.3.4 Identification of Vulnerabilities

Vulnerability is defined as any weakness, flaw or condition that allows and/or can be exploited, for the successful realization of a potential threat against the CHSRP. In general, vulnerability conditions allow access to an asset in order to be attacked. As the threat environment is ever changing, vulnerabilities to different threats and attack methods may also change, which requires updated review of the threats, vulnerabilities and the consequences. However, by addressing known vulnerabilities and therefore limiting the associated consequences of a potential threat, the likelihood of having to make significant changes is reduced for future updates.

Vulnerability conditions can be classified into two different types, physical, and procedural. A physical vulnerability condition is an actual physical deficiency, flaw, or absence of physical measures designed to deter, detect, delay, and/or respond against a breach or unauthorized access to an asset. A procedural vulnerability condition relates to the existence, implementation, legality, and oversight of policies and procedures, which are designed to deter, detect, delay, or respond against a breach or unauthorized access to an asset.

Successful execution of an attack type is dependent upon the presence of either a physical vulnerability, or a procedural vulnerability, or both. By identifying the physical and procedural conditions that contribute to a certain threat type and attack method, it is possible to start developing general mitigation strategies to address the vulnerability and therefore reduce the likelihood and/or consequences of a successful attack.

In a new project, the assumption is that the system is completely without mitigations measures, but takes into account typical operating features and assets. Any countermeasures that might impact a perceived vulnerability will be recommended for implementation into the design and construction. Assessments performed on existing systems look for the weaknesses in an existing design or system.

Table 4-11 details the vulnerability levels used as part of the vulnerability determination.

Table 4-11 Vulnerability Levels and Description

Vulnerability Level	Assessment Criteria
Very High	• Non-existent advanced physical and procedural mitigation measures • Inadequate existing mitigation measures; and will likely fail to deter, detect, delay, or respond to a security risk • No security awareness culture present • No business or operations contingencies to manage security events and recover. Severe disruptions are likely
High	• Some physical and procedural mitigation measures, but ineffective at deterring, detecting, delaying, or responding to advanced security risks • More than 50% of existing mitigation measures are likely to fail to deter, detect, delay, or respond to a basic security risk • No security exercises performed or planned • Few contingencies/plans are in place for business and operations recovery. Significant disruptions likely
Moderate	• 50% of advanced physical and procedural mitigation measures are effective with remaining measures likely to fail to deter, detect, delay, or respond to a security risk • Existing mitigation measures are capable of deterring, detecting, delaying, and responding to basic security risks • Exercise program exists and exercises are performed for select areas • Basic security awareness culture • Contingencies/plans are in place across most but not all key areas of business and operations, but require improvement. Some disruptions are likely
Low	• 50% - 80% of advanced physical and procedural mitigation measures are effective but some improvements are required • Existing mitigation measures are capable of deterring, detecting, delaying, and responding to basic security risks • Procedures and evidence (records) of audit and review of existing security measures • Exercise program exists and exercises are performed for select areas • Cultivation of security awareness culture is a primary objective of management • Business and operations contingencies plans are in place for all key areas to manage security events and recover
Very Low	• 80% or higher effectiveness of advanced physical and procedural mitigation measures to deter, detect, delay, and respond to security risks and are sustainable • Procedures and evidence (records) of audit and review of existing controls • Exercise program exists and exercises are performed for select areas • Security awareness culture is integrated into all business activities • Comprehensive contingency plans in place across entire business and operations to manage most identified disruptions

4.3.5 Determining Likelihood

Likelihood is the combination of threat and vulnerability. Table 4-12 describes the combination of the threat and vulnerability to create the likelihood rating and index.

Table 4-12 Likelihood Determination Matrix (Threat x Vulnerability)

Threat	Vulnerability				
	Very High	High	Moderate	Low	Very Low
Very High	Almost Certain	Almost Certain	Highly Likely	Likely	Likely
High	Almost Certain	Highly Likely	Highly Likely	Likely	Possible
Medium	Highly Likely	Likely	Likely	Possible	Possible
Low	Likely	Likely	Possible	Possible	Remote
Very Low	Possible	Possible	Possible	Remote	Remote

The likelihood is based upon the definitions in Table 4-13.

Table 4-13 Likelihood Rating and Definitions

Likelihood Rating	Likelihood Characteristics
Almost Certain A	Vulnerability exists and threat is proven and demonstrated. Threat realization can be expected to occur during the system's operational phases
Highly Likely B	Vulnerability exists and threat is proven although may not be demonstrated. Threat realization may be expected during system's operational phases
Likely C	Some vulnerability exists and threat has some resource, experience, and skill, though may not be demonstrated. Threat realization may occur during the system's operational phases
Possible D	Limited vulnerability exists and threat may be under resourced and may lack experience and skill, should not occur during the system's operational phases
Remote E	Limited vulnerability exists or threat has not been proven or demonstrated, not expected during the system's operational phases

4.3.6 Determining the Consequence

Consequence is the assessed impact and severity of a successful threat against an asset, the system, or network. Consequence is measured by the level of impact on primary areas of people, equipment or service and finances. Reputational impacts can also be assessed. Examples of consequences include injuries to the public or to CHSRP personnel, loss of equipment causing financial losses, and disruption to CHSRP operations. Reputational damage occurs when the system is considered unsafe or dangerous, impacting ridership, and funding. Severity categories are defined to provide a qualitative measure of the result of a security breach and are summarized in Table 4-14.

Table 4-14 Consequence Ratings and Assessment Criteria

Severity Rating	CHARACTERISTICS			
	People	Equipment or Services	Financial	Reputational
Catastrophic 1	Several deaths and/or numerous severe injuries	Total loss of equipment or system interruption requiring months to repair	Estimated loss in excess of $5 million	Ongoing international, national media coverage, severe reputational damage, government intervention, Weeks - Months
Critical 2	Low number of deaths (less than 3) and/or severe injuries	Significant loss of equipment or system interruption, requiring weeks to repair	Estimated loss from the incident expected to range from $500,000 to $5 million	Prolonged national and local media, serious reputational damage, sustained government involvement, Days-Weeks
Moderate 3	Possible severe injury or several minor injuries	Loss of equipment or system interruption, requiring seven or less days to repair	Estimated loss from the incident expected to range from $50,000 to $499,999	Adverse national and local media coverage, reputational damage, government involvement
Minor 4	Possible minor injuries or illness	Minor loss of equipment, no system interruption, less than 24 hours to repair	Estimated loss from the incident expected to be minor, $1000 to $49,999	Local media coverage and some reputational damage
Negligible 5	No injuries or illness	Minor damage to equipment, no system interruption, no immediate repair necessary	Estimated loss less than $1000	No adverse media coverage or reputational damage

4.3.7 Security Risk Criticality Matrix

The consequence, or severity, of a threat and the likelihood of occurrence will be combined into a risk level criticality matrix. The consequences will be assessed both in terms of severity of impact and probability of occurrence for a given threat. The criticality matrix organizes the resulting consequences into categories of high, serious, and low. The matrix will help to prioritize risk to focus available resources on the most serious threats requiring resolution while effectively managing the available resources. The Security Criticality Matrix is shown in Table 4-15.

Table 4-15 Security Risk Criticality Matrix (Likelihood X Consequence)

Consequence Severity	Likelihood				
	Almost Certain A	Highly Likely B	Likely C	Possible D	Remote E
Catastrophic – 1	Very High 1A	Very High 1B	High 1C	High 1D	Moderate 1E
Critical – 2	Very High 2A	High 2B	High 2C	Moderate 2D	Moderate 2E
Moderate – 3	High 3A	High 3B	Moderate 3C	Moderate 3D	Low 3E
Minor – 4	Moderate 4A	Moderate 4B	Moderate 4C	Low 4D	Very Low 4E
Negligible – 5	Low 5A	Low 5B	Low 5C	Very Low 5D	Very Low 5E

Source: Adapted from FTA's Public Transportation System Security and Emergency Preparedness Planning Guide

Once the risk rating is determined for each security risk to each identified asset, then the risk index at Table 4-16 can be used to determine and prioritize the resources and financial justification for risk treatment.

Table 4-16 Security Risk Index

Risk index	Risk Rating	Action Required
1A, 1B, 2A	VERY HIGH	Risk must be immediately mitigated and constantly monitored
1C, 1D, 2B, 2C, 3A, 3B	HIGH	Risk must be treated and monitored, Authority decision at the SSEC level is required to accept risk.
1E, 2D, 2E, 3C, 3D, 4A, 4B, 4C	MODERATE	Risk should be managed and reduction strategies implemented. Authority decision at the SSPC level is required
3E, 4D, 5A, 5B, 5C	LOW	Risk may be accepted after a risk review by the SSWG
4E, 5D, 5E	VERY LOW	Risk would normally not be treated

Source: Adapted from FTA's Public Transportation System Security and Emergency Preparedness Planning Guide

4.3.8 Countermeasure Development

After determination of the risk, countermeasures or corrective actions are developed that can mitigate or eliminate the risk. Effective countermeasures can either be design or procedural or a combination. Examples of design or engineered countermeasures include the following:

- Installing physical barriers designed to reduce the asset's vulnerability to unauthorized access, explosive, or other incendiary attacks
- Installing integrated intrusion detection and alarm systems throughout key facilities
- Installing chemical, biological, radiological and/or nuclear detection devices at facility and station locations

Procedural or Administrative countermeasures include the following:

- Increasing the frequency of security patrols at key asset locations
- Increasing security-related training to improve the abilities of employees to identify suspicious packages or activities
- Conducting emergency exercises and drills involving security-related scenarios
- Developing working groups and information exchange committees with local law enforcement and emergency response agencies.

During the development of countermeasures, consideration will be given not only to the initial costs of procurement and implementation, but also to the associated maintenance costs and expected level of effectiveness at eliminating or controlling the threat and/or vulnerability. Cases where conditions may be exacerbated, such as special events, will be taken into account. During these conditions, ridership is likely to be greater than normal and may impact the effectiveness of the countermeasure.

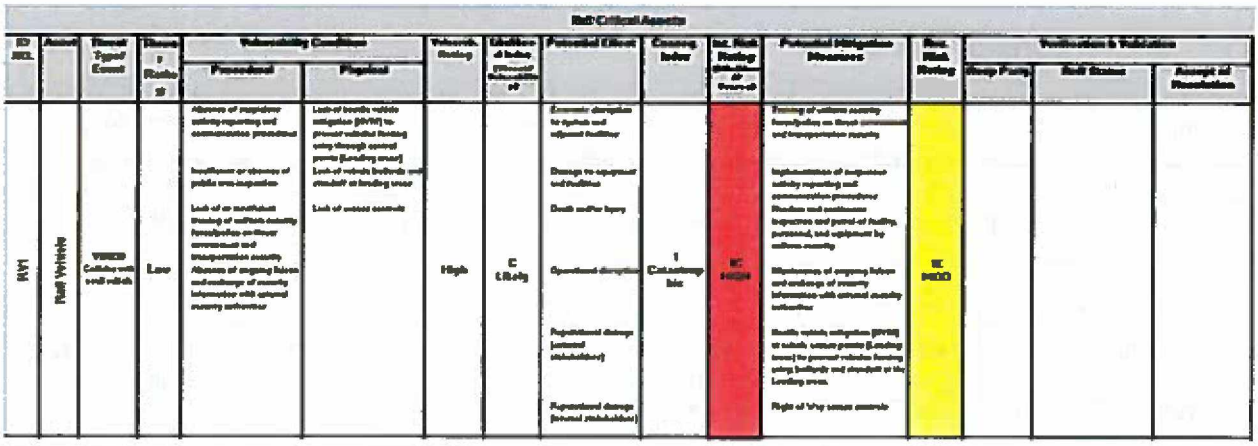
4.3.9 Residual Risk

Residual risk refers to the risk remaining after application of the countermeasures. If the residual risk has not been reduced to an acceptable level, additional countermeasures or mitigation strategies must be considered.

4.3.10 Reporting

The assessment details are captured in worksheets or tables which define the major elements of specific scenarios. An example of a TVA worksheet is depicted in Figure 4-3.

Figure 4-3 Security Risk Worksheet Example



4.4 Verification and Validation Documentation

Each identified safety hazard and security risk will be managed to resolution through the hazard management methodology and documented in the Dynamic Object Oriented Requirements Management System (DOORS) database system adopted by the CHSRP. The V&V methodology and documentation requirements are described in the CHSRP Verification and Validation Management Plan.

5.0 DEVELOPMENT OF SAFETY AND SECURITY DESIGN CRITERIA

5.1 Prevention through Design

Hazards can be resolved by deciding to either assume the risk associated with the hazard or to eliminate or control the hazard. The Prevention through Design principle, as identified in ANZI Z590.3-2011 *Prevention through Design*, incorporates safety and security considerations into the early design of a system element so as to avoid, eliminate, or mitigate hazard risk to a level as low as reasonably practicable. The following order of precedence shall be applied when incorporating safety considerations into design:

1. Avoidance. Develop concepts of operations, basis of design, or general system requirements to avoid the introduction of hazards to the system.
2. Elimination. Design, redesign or retrofit to eliminate (i.e., design out) the hazards through design selection. This strategy generally applies to acquisition of new equipment or expansion of existing systems; however, it can also be applied to any change in equipment or individual subsystems.
3. Substitution for Minimum Risk. If an identified hazard cannot be eliminated, reduce the associated risk to an acceptable level. This may be accomplished, for example, through the use of fail-safe devices and principles in design, the incorporation of high-reliability systems and components and use of redundancy in hardware and software design.
4. Engineering Controls. Hazards that cannot be eliminated or controlled through design selection will be controlled to an acceptable level through the use of fixed, automatic or other protective safety design features or devices. This could result in the hazards being reduced to an acceptable risk level. Safety devices may be part of the system, subsystem or equipment. Examples of safety devices include interlock switches, protective enclosures and safety pins. Care must be taken to ascertain that the operation of the safety device reduces the loss or risk and does not introduce an additional hazard. Safety devices will also permit the system to continue to operate in a limited manner. Provisions will be made for periodic functional checks of safety devices.
5. Provide Warning Devices. When neither design nor safety devices can effectively eliminate nor will control an identified hazard, devices shall be used to detect the hazardous condition and generate an adequate warning signal to provide for personnel remedial action. Warning signals and their application will be designed to minimize the probability of incorrect personnel reaction to the signals and will be standardized within like types of systems. Warning signals and their application should also be designed to minimize the likelihood of false alarms that could lead to creation of secondary hazardous conditions.
6. Administrative Controls. Where it is not possible to eliminate or adequately control a hazard through design selection or use of safety and warning devices, procedures and training will be used to control the hazard. Special equipment operating procedures can be implemented to reduce the probability of a hazardous event and a training program can be conducted. The level of training required will be based on the complexity of the task and minimum trainee qualifications contained in training requirements specified for the subject system element and subsystem. Precautionary notations in manuals will be standardized. Safety critical tasks, duties and activities related to the system element and subsystem will require certification of personnel proficiency. However, without specific written approval, no warning, caution or other form of written advisory will be used as the only risk reduction method for unacceptable and undesirable hazards.
7. Personal Protective Equipment and Guards: Where no other higher-level alternative mitigations are possible, the use of personal protective equipment or the installation of guards will be used to mitigate the hazard. Personal protective equipment and guards may be used to supplement other higher-level mitigations, but when they are the only mitigation applied they are to be used only when no other alternatives exist.

5.2 Design Criteria

Design criteria are developed from the engineering experience of the design team obtained from numerous other rail projects, as well as the following sources:

- Formal hazard analyses, including Preliminary Hazard Analysis
- Threat and Vulnerability Assessments
- Federal Railroad Administration regulations found in Code of Federal Regulations Title 49, Parts 200-299
- California Public Utilities Commission (CPUC) General Orders
- California Building Code
- California State Fire Marshal's Office direction and recommendations
- Local building codes and Fire Marshal recommendations
- National Fire Protection Association (NFPA)
- American Public Transportation Association (APTA)
- American Railway Engineering and Maintenance-of-Way Association (AREMA)
- Underwriters Laboratories (UL)
- Safety and security recommendations of the Department of Homeland Security (DHS), Transportation Security Administration (TSA), and the Federal Transit Administration (FTA)
- Other industry or technical standards

CHSRP will conduct PHAs and TVAs during the Preliminary Engineering phase to aid in defining safety and security design criteria.

Design criteria are developed to address system safety and security requirements applicable to the entire system. System safety and security requirements for each specific design element will be incorporated into a Design Manual chapter entitled *CHSRP Design Criteria* with reference to corresponding design criteria for specific engineering elements (e.g., clearances, structures, seismic criteria, etc.).

The processes described in the *CHSRP Verification and Validation Management Plan* (VVMP) will ensure that the design criteria and the basis of design report will incorporate safety and security requirements into the system design.

The following documents have been prepared by the RDP in order to achieve the system's design criteria's objectives:

- Basis of Design Report
- Risk Management Plan and Hazard Log
- System Requirements
- Infrastructure Maintenance Plan
- Technical Memoranda
- Design Criteria
- Standard Drawings
- Standard Specifications

A consistent approach will be utilized within all the engineering efforts and will assist the CHSRP Regional Consultant teams in preparation of their designs.

The *Basis of Design Report* defines the key CHSRP performance requirements. This document serves as the guiding force in establishing the design criteria and development of design standards. The key audience for the Basis of Design Report is the Authority, the Program Manager, the Regional Project Managers, and the Section Designers. The purpose of the report is to guide the Engineering Management Team during the development of engineering criteria and provide the required performance levels for the CHSRP.

A *Risk Management Plan and Hazard Log* will be developed outlining methodologies to ensure that a consistent approach to risk assessment and cost are applied throughout the CHSRP. The plan will address both system safety risk and project delivery risk, and include a Program level risk register that will be regularly updated and maintained.

The *CHSRP System Requirements* provides a common platform for which similar Code of Federal Regulations, CPUC General Orders, and European Union Technical Specifications for Interoperability, as well as other industry best practice and standards, can be collectively presented and assessed at a detailed technical level. In addition to guiding and supporting specific technical guidance at the subsystem level, the CHSRP System Requirements structure is used to demonstrate how the performance objectives of the CHSRP are to be achieved.

Technical Memoranda have been prepared to describe detailed analysis of specific technical topics, and to provide guidance to the Regional Consultants in the development of Preliminary Engineering to support feasibility, environmental, and procurement efforts. Technical Memoranda are provided as information to Final Design teams, but are not considered mandatory requirements.

The *Infrastructure Maintenance Plan* is a base document outlining how the CHSRP will be maintained. This document sets forth the requirements for maintenance facilities for rolling stock and the railway infrastructure, as well as the approximate location and size of supporting facilities.

Design Criteria have been prepared that is intended to serve as the design requirements for a possible Design/Build consortium. The Design Criteria identifies and specifies required elements and considerations to ensure a safe and reliable operating railway for the CHSRP. The Design Criteria will be supported by *Standard Drawings* and *Standard Specifications* as required.

5.3 Design Reviews

CHSRP drawings and specifications will be reviewed informally during development and formally during preliminary and final design. The purpose of these reviews will be to verify conformance with all of the projects design criteria. These reviews are performed by the corresponding RDP discipline design personnel, their design supervisors, applicable oversight agencies, representatives from the Regional Consultants, and the RDP System Safety and Security staff.

Design reviews will be scheduled and coordinated so as to permit ample opportunity for comments. After satisfactory resolution of comments, the specifications are "sealed" by professional engineers from the design team and issued for use.

5.4 Deviations and Changes

For any instances that arise requiring a possible deviation from the safety-critical or security critical design criteria (i.e., physical constraints identified within the system's corridor conflicting with baseline requirements), the RDP and the associated segment Regional Consultant during Preliminary Engineering (and RDP and Design/Build Contractor during Final Design) will be required to explore all reasonable alternatives to provide a design that conforms to the requirements of the existing criteria. If a reasonable alternative cannot be developed, the requesting party will submit a Design Variance Request (DVR) to the RDP, whose members include safety and security personnel and representatives of the required engineering disciplines. The requesting party will be responsible for identifying and resolving any hazards or vulnerabilities related to any deviations.

Any deviations to the Design Criteria developed by the RDP or design/build contractors will require a site-specific assessment for each deviation to ensure that the same level of safety and security is achieved as would have occurred had the Design Criteria been followed. A formal PHA or TVA may be required to

support the safety and security assessment of Design Criteria deviations. If the change request is approved, the findings and recommendations will be incorporated into the Final Design engineering and construction plans and the Final Design Certifiable Items Lists and Safety and Security Certification Package will be updated to reflect the change.

During the life cycle of the project, the SSPC may also confront design issues that require additional hazard analysis or vulnerabilities assessment, the outcome of which may result in requests for design changes. Such requests will be processed through the Design Variance Request process.

The RDP is responsible for monitoring all requests for design variances from compliance with the Design Criteria or Design Standards documents, including statutory and regulatory requirements and requirements specified in any contract. The Design Variance Request process is described in more detail in Design Variance Guidelines R2.

6.0 OPERATIONS AND MAINTENANCE

6.1 Operations and Maintenance Requirements

The Authority's Operations and Maintenance Team, supported by the Safety and Security Team, will be responsible for developing system operations and maintenance requirements that support the safe and efficient operation of the California High-Speed Rail Program. Principal activities during the development of the CHSRP include the following:

- Provide ongoing operations input to the Engineering Management Team and Regional Engineering teams in the development of system design elements
- Review and comment on engineering design elements to ensure responsiveness to operations' functional requirements
- Coordinate with FRA on development of CHSRP rules and procedures and their relationship to current regulations and new regulations that will emerge from the CHSRP. Key categories include:
    - Code of Federal Regulations (CFR) regulatory issues
    - Rail System Operating Rules and Procedures
    - Employee Safety Rules and Procedures
    - Standard Operating Procedures
    - Emergency Action Operations Plans and Procedures
    - Infrastructure /Systems maintenance and inspection procedures
    - Rolling Stock maintenance and inspection procedures
- Coordinate with railroads, operating agencies/rail service providers and stakeholders as required

Personnel staffing requirements for the operation and maintenance of the in-service CHSRP will be established and described in the *CHSRP Training and Personnel Qualification Plan*, to be developed prior to the startup of revenue operations.

Development of the *CHSRP Operations and Maintenance Plan* for any system or subsystem component will begin during Construction Phase. Position titles, responsibilities, qualifications, and training requirements will be identified consistent with other high-speed rail operating systems using similar technologies and operating characteristics. The magnitude of the in-service CHSRP (trains operated, vehicles in service, track and OCS systems to maintain) will determine staffing levels for operators, maintainers, and supervisors.

Additionally, the *CHSRP Infrastructure Maintenance Requirements Plan* (IMRP) establishes and describes how infrastructure maintenance will be planned and implemented including methods utilized and resources required. The IMRP specifies the CHSRP requirements necessary to meet passenger and public safety levels that meet or exceed FRA Class 6 Regulatory Safety Standards, consistent with FRA's High-Speed Passenger Rail Safety Strategy. IMRP requirements will be incorporated into the system Design Criteria during the Preliminary Engineering phase of the CHSRP.

6.2 Operational Plans, Rules and Procedures

The following documents will be developed or revised for the CHSRP during the Project Construction Phase, in preparation for Testing and Startup:

- Concept of Operations
- Code of Operating Rules
- Rolling Stock Maintenance Plan
- Infrastructure Maintenance Requirements Plan
- Training and Personnel Qualification Plan
- Service/Operating Plan
- Command and Control Facilities Plan
- On-Board Operating Plan
- Passenger Station Operating Plan
- Passenger Train Emergency Preparedness Plan
- Air Brake Operating Instructions
- Electrical Operating Instructions
- Emergency Operating Procedures
- Timetable Special Instructions
- On-Track Safety Rules
- System Safety Program Plan (SSPP)
- System Security Program Plan (SPP)
- Emergency Preparedness Plan

6.3 Training Program

The Authority intends to hire one or more concessionaires to provide rail operations and maintenance services. The Authority will be responsible for ensuring that the concessionaire(s) assign qualified O&M personnel to the CHSRP who are trained to perform pre-revenue and revenue operations. Instruction in safe methods of operation, safety requirements, security awareness and emergency response procedures will be included in manuals, handbooks, and other documentation developed for the training and certification of operations and maintenance personnel. Training plans, which include in-house classroom training and on-the-job training and testing, will be developed based on the individual characteristics of the equipment or CHSRP locations.

The future CHSRP Operators, Instructors and Field Supervisors will undergo familiarization training on all operational equipment, rules, plans and procedures. The future Central Control Operations Staff (including Superintendents, Supervisors, and Train Dispatchers) will require extensive training and qualification on the train control system, in addition to operating rules and procedures, and safety and security procedures.

Positions which will require detailed job descriptions and training programs prior to entering the Testing Phase of the CHSRP include, but are not limited to the following:

- Superintendents
- Operations Supervisors
- Train and Engine Service Employees
- Control Center Supervisors
- Control Center Train Dispatchers
- Equipment Maintenance Employees
- Signal and Communications Employees
- Maintenance of Way Employees
- Power and OCS Employees

Contractors and suppliers providing equipment and facilities for the CHSRP will be responsible for developing training plans, training manuals, and conducting training courses for applicable CHSRP

Operations and Maintenance staff. Contractors will be required to develop and implement programs to train appropriate CHSRP personnel in the operation and maintenance of each piece of equipment or systems provided in conformance with the *CHSRP Training and Personnel Qualification Plan*.

6.4 Emergency Preparedness

A *Passenger Train Emergency Preparedness Plan* (PTEPP) will be developed prior to the start of the Testing Phase of the CHSRP to prepare for emergency incidents that may occur during testing. The PTEPP will be further developed and carried over into the start of revenue service. The PTEPP will contain emergency preparedness requirements and procedures for the Operations and Equipment Maintenance disciplines, in compliance with 49 CFR, Part 239. The PTEPP will identify requirements for a program of training (including instructional programs, emergency preparedness drills and tabletop exercises) of railroad operating and maintenance personnel and emergency responders. The goal of the PTEPP is to verify and validate the following:

- Adequacy of emergency plans and procedures
- Readiness of railroad operating and maintenance personnel to perform under emergency conditions
- Effective coordination between railroad operations and emergency response agencies: police, fire, and emergency medical services
- Familiarization of fire, police, and emergency medical services personnel with the physical and operating characteristics of CHSRP operations and inherent hazards

After-action reviews will be conducted following any major emergency response event or exercise prior to the start of revenue operations. A report of the findings will be provided to the SSPC and SSEC. Action items will be tracked by the SSPC to completion.. Outcomes may include recommendations for revisions to the PTEPP, operating rules or procedures, equipment or infrastructure changes, or emergency responder procedures, and changes to training plans and training programs pertaining to emergency response and personnel.

Fire/Life Safety and Security Committees will be active at both a regional and State level as described in Section 3.5.3 of this SSMP to provide a vehicle for clear, consistent communication with emergency responders.

7.0 SAFETY AND SECURITY CERTIFICATION PROGRAM

7.1 Overview

The California High-Speed Rail Authority is ultimately responsible for ensuring that all safety-critical and security-critical elements of the CHSRP are designed, constructed, tested, and made operationally ready in a safe and secure manner. The Safety and Security Certification Program (SSCP) describes the responsibilities and processes required to demonstrate that the CHSRP is safe and secure, in conformance to the FTA *Handbook for Transit Safety and Security Certification* and other FRA Regulations as applicable. The Safety and Security Certification Program applies to all phases of the development of the CHSRP, from preliminary engineering to the start of revenue operations, for each segment designed and built for the system. FRA approval to operate will be achieved through final safety and security certification prior to the start of revenue service.

The SSCP scope encompasses safety and security certification of the facilities, systems and equipment, safety-related procedures, training programs, and hazard and vulnerability resolution activities and operational readiness for the project. Specifically, safety and security certification focuses on conformance to the requirements found in the following areas:

- Hazard and Vulnerability Resolution
- Design Criteria
- Construction Specification
- Safety-Related Testing
- Operations and Maintenance Manuals
- Rules and Procedures

Certification will be performed in phases, both geographically and chronically, by contract package once the Project moves beyond the Preliminary Engineering Phase. Certification of latter-phase contract packages may consist of one or more certifiable elements defined in Section 7.4.1. The exceptions to this are the system wide activities such as procedures, training, emergency drills and integration testing and start-up which will be certified for the complete system.

Certification occurs at the beginning of each project phase, and is required for advancing system elements into the next phase. For example, the Final Design of a bridge structure must be certified to meet all safety and security design criteria prior to construction, and then must be certified to have been built in conformance to those safety and security design criteria before being placed into operation. This process assures the Authority that CHSRP elements are safe and secure as they move through each successive phase of the System development.

Certification Items that are not completed prior to moving to the next phase are placed on an Open Items List and tracked to completion. The Open Items List process is described in Section 7.4.7.

A Certificate of Conformance is issued after completion of a Project phase for each certifiable element. The Certificate of Conformance required for the various elements necessitates the performance of a variety of safety and security assessment activities. The activities may be performed either independently, or integrated with other tasks such as acceptance testing or quality control measures. Regardless of whether the activities are performed independently or integrated with others, adequate system safety, security, and fire/life safety activity records must be developed and maintained as evidentiary support for the Certificate of Conformance.

The verification and validation (V&V) database program will be used to manage the demonstration of objective evidence that satisfies the safety and security requirements during Final Design and Construction or Implementation. The process to develop the Safety and Security Certificate of Conformance will be supported by the requirements management database program used by the larger V&V process but requires distinctly different output documents.

7.2 Program Goals and Objectives

The goals of the Safety and Security Certification Program are to verify that identified safety and security requirements have been met in the preliminary engineering, final design, and construction phases and to provide evidence that the CHSRP is safe and secure for revenue service.

The objectives of the Safety and Security Certification Program are to document the following:

- Safety and security design criteria are reflected in contract documents
- Facilities and equipment have been designed, constructed, manufactured, inspected, installed, and tested in accordance with safety and security requirements
- Operations and maintenance procedures and rules have been developed and implemented to ensure safe operations
- Training documents have been developed for the training of operating and emergency response personnel
- Transportation and maintenance personnel have been trained and qualified
- Emergency response agency personnel have been prepared to respond to emergency situations in or along the CHSRP corridor
- Safety and security systems integration tests have been conducted
- All safety and security related issues have been addressed, resolved and documented

7.3 Responsibilities

The Authority Safety and Security Manager, with the assistance of the RDP System Safety Manager and RDP System Security Manager, will have overall responsibility for the administration of the Safety and Security Certification Program through the oversight of the SSPC and SSEC.

The SSPC will be responsible for tracking the progress of safety and security certification through regular review and update of the Program-level CIL and PHA/TVA maintained by the RDP Safety Manager and RDP Security Manager.

FRA approval to operate will be achieved through final safety and security certification prior to the start of revenue service.

7.4 Safety and Security Certification Process

The CHSRP safety and security certification process will be divided in the following distinct stages and steps.

- Stage 1: Environmental Review / Preliminary Engineering
- Stage 2: Design / Build Contracts
  - Step 1: Final Design
  - Step 2: Construction
  - Step 3: Testing / Acceptance
- Stage 3: Final Integration, Testing and Certification

During the preliminary engineering phase Preliminary Hazard Analysis (PHA) or Site-specific Hazard Analysis (SiSHA) will be performed by the RDP System Safety Manager. Hazards are identified by various means such as historical data, generic hazard checklists, conceptual design, already developed design criteria, scenario development and the subjective judgment of a hazard management team during formal brainstorming workshop sessions. The hazard analysis is then performed on the identified hazards. The principal means of identifying security-related design criteria are Threat and Vulnerability Assessments (TVA) conducted by the RDP System Security Manager in collaboration with the other RDP discipline technical experts. Other analyses, including site-specific threat and vulnerability assessments (SiSTVA)

are conducted as necessary. The adopted mitigation measures from the PHA and TVA provide input to design criteria or other project requirements. The mitigation measures identified in SiSHA and SiSTVA are contract specific and are tracked for resolution in the specific Design/Build (D/B) contract. Chapter 4 of this SSMP describes the Authority's Hazard Management Program.

Once all design/build contracts have been successfully completed and certified, the CHSRP as a whole system will be integrated, tested and certified under supervision of the Authority.

7.4.1 Certifiable Elements

The Project has defined CHSRP Certifiable Elements for safety and security certification. Samples of sub-elements are listed under the Certifiable Elements.

- Trainway
  - Track
  - Trench Structures
  - Tunnel/Underground
  - Aerial Structures
  - Retaining Structures
  - Alignment
  - Access/egress facilities
  - Barriers and Warnings
  - Utilities
  - Adjacent Hazardous Facilities/Conditions
- Rolling Stock
  - Carbody
  - Couplers
  - Doors, door controls
  - Trucks and suspension
  - Braking
  - Operator Cab and Controls
  - Communications Equipment
  - Lighting
  - HVAC
  - Fire/Flammability/Smoke Emissions
- Station(s)
  - Elevators/Escalators
  - Station structure
  - Stand-by generators
  - Platforms
  - Concourse
  - Lighting
  - Access/egress facilities
- Support Facilities
  - Storage/setup Yards
  - Vehicle Maintenance Facilities
  - Track maintenance facilities
  - Operations Control Center

- Traction Power
  - Traction Power Substations
  - Switching Stations
  - Overhead Catenary System
- Ventilation
  - Emergency Ventilation System
  - Ventilation Structure
- Communications
  - Radio
  - Closed Circuit TV
  - Emergency Telephone
  - Emergency Trip Station
  - Fire Telephone
  - Public Address System
- Signals and Train Control
  - Mainline Controls and Indications
  - Grade Crossing Warning Devices
  - Track Signals
  - Signal Indications
  - Train Protection
  - Interlocking Circuits/Equipment
- Test Plans
  - Acceptance Test
  - Integrated Tests
  - Pre-revenue Tests
- Training and Certification
- Plans and Procedures
  - Safety and Security Plans
  - Operation and Maintenance Plans (SOPs and EOPs)
  - Manuals and Rulebooks
  - Emergency Response and Management
    - Drills and Exercises

PHATVA are completed by the Authority for hazards associated with the Certifiable Elements, assessing the extent of the hazards and threats/vulnerabilities and identifying potential mitigations to reduce the residual risk to an acceptable level. The sub-element listing will be modified and expanded as project develop, as additional hazard analyses are performed, and as new or modified hazards are identified. Hazard identification can be performed by the Authority, the RDP, or Design/Build Contractors but all hazards must be tracked through the one central CHSRP tracking system.

7.4.2 Certifiable Items Lists

The Authority has developed a Certifiable Items List (CIL) which includes mitigations derived from the Program-level PHA and TVA. The CIL is managed through the V&V DOORS database management system by the Authority and Contractors through all Project phases to ensure that the safety and security hazards identified are mitigated consistently throughout the project life cycle. The Final Design and

Construction Contractors shall update and revise the CIL according to their project scope, as new or revised hazards as are determined through site-specific PHA or TVA associated with their design activities.

The additional CILs identified during each project phase or contract package will carry over into subsequent project phases or contract packages.

CILs that are specific to safety and security requirements will be distinctly identified as such and tracked and submitted independently.

7.4.3 Tracking of Hazards and Vulnerabilities

The program-level and project-specific CILs will be managed using the DOORS database, allowing for consistency and completeness across all Project phases. The CIL identifies the major elements of the CHSRP that are to be proven to be safe and secure prior to the startup of revenue service and acts as a guide for the certification process throughout project life cycle. The safety and security related portions of the CIL will be developed by the RDP System Safety and Security Managers in collaboration with the other discipline technical experts and presented to the SSPC for review. The CIL will be updated and expanded following the completion of analyses during the various phases of the development of the CHSRP. A sample CIL is depicted in Figure 7-1. Regular updates of the CIL will be presented to the SSPC and included in the quarterly reports to the SSEC.

Note – Figure 7-1 is a sample representation only. Refer to current CIL for identified hazards and required mitigations.

7.4.4 Certification of Final Design and Construction

The Contractors are responsible for completing and updating the CILs applicable to their specific project scope during both the Final Design and Construction Phases. The Contractors shall identify in the resolution section of the CILs objective evidence that demonstrates compliance with the required safety-critical or security-critical requirements. Objective evidence may consist of any output from the design or construction processes that allows for clear and unequivocal verification that the requirements of the design criteria are satisfied. Examples include item-specific references on signed/approved drawings, reports, design variance requests, or other official documents signed/certified by the Contractor. Emails, directive letters, or meeting minutes are examples of documents that are not to be considered as objective evidence.

Requests for variance from the requirements identified in the CILs shall be handled through the process identified in Section 5.4 and shall include a site-specific assessment for each deviation to ensure that the same level of safety and security is achieved as would have occurred had the Design Criteria been followed. Certification Items that are not completed prior to moving to the next phase shall be managed according to the Open Items process outlined in section 7.4.6.

Completed CILs for a particular element or infrastructure component, along with associated supporting material, shall be compiled in a Certificate of Conformance Package by the Contractors and submitted to the Authority for review and SONO, prior to moving to the next project phase, at Final Design and Construction. Certificate of Conformance Packages shall consist of a Certificate of Conformance specific to the project element, all completed CILs, and all supporting documentation such as design element descriptions, hazard analysis, drawings, specification, design variances, field reports and photographs.

Completed Certificate of Conformance Packages (Final Design or Construction) for a substantial grouping of contract elements shall be submitted to the Authority through the SSEC for certification that all safety and security requirements have been successfully completed and that the System is ready for revenue service.

A sample Certificate of Conformance is depicted on Figure 7-2.

Phase: PE – Preliminary Engineering

To all signatories: Please review the included information and sign and date in the appropriate spaces. By signing this form, you are certifying that the critical item described has been coordinated between the Specifier and all Verifiers, and that the Certifiable Item has been verified for safety and security certification in conformance with the CHSTS safety-critical and security-critical requirements. Please do not amend any of the information in the form. If you have comments on the contents, please return the form unsigned.

To Specifier: After reviewing the contents, please sign the front page and initial the individual entries in the attached table. By signing this form, you hereby certify that:

1. the documentation referenced by you accurately specifies the requirements of the critical item, and
2. the documentation referenced by the Verifier fully satisfies the requirements of the critical item.

Specifier Signature

7.4.5 Testing Phase Certification

The safety-critical and security-critical items for systems identified during the Final Design and Construction Phases shall be carried over into the Testing Phase. The CILs shall be expanded to include a Testing section upon completion of the Final Design phase of a particular CHSRP element In addition, the relationships between systems and subsystems shall be analyzed for systems integration requirements as identified in a Systems Integration Test Plan, and CILs for integrated testing shall be developed to prove the integration of associated systems. Safety and security certification of the Testing phase shall be completed in conformance with the process described in Section 7.4.3.

The Systems Contractor(s) shall be responsible for any additional analyses that are required (PHA, TVA, FMEA, IHA, SHEA, FTAn and OHA as appropriate), as the safety-critical or security-critical testing criteria are developed and applied to specific CHSRP system or subsystem elements. The Systems Contractor(s) shall be responsible for developing and completing the CILs that apply to their scope of work during the Testing Phase. The system(s) contractor must identify in the resolution section of the CILs objective evidence that demonstrates compliance with testing requirements that are identified as safety-critical or security-critical. Requests for variance from the requirements identified in the CILs shall be handled through the process identified in Section 5.4.

7.4.6 Startup Phase Certification

The safety-critical and security-critical items for operational readiness of the CHSRP identified during the Final Design, Construction and Testing Phases shall be carried over into the Startup phase. The CILs shall be expanded to include a Startup section as the CHSRP is prepared for the start of revenue operations.

Certifiable startup items include but are not limited to operation plans, emergency preparedness plans, training programs, timetables and rulebooks. Safety and security certification of the Startup phase shall be completed in conformance with the process described in Section 7.4.3.

The O&M contractor(s) shall be responsible for completing the CILs that apply to their scope of work prior to the start of revenue service. The O&M contractor(s) must identify in the resolution section of the CILs objective evidence that demonstrates compliance with requirements for the start of revenue operations that are identified as safety-critical or security-critical. The O&M contractor(s) shall be responsible for any additional analyses that are required (PHA, TVA, FMEA, IHA, SHEA, FTAn and OHA as appropriate), as the safety-critical or security-critical criteria for startup are applied to specific CHSRP, subsystem or operational elements. Requests for variance from the requirements identified in the Certifiable Items Lists shall be handled through the process identified in Section 5.4.

7.4.7 Open Items List

Certifiable Items that cannot be closed prior to the start of the next project phase shall be placed on an Open Items List for tracking purposes. The Open Items List shall describe the Certifiable Item that cannot be certified at that time, the reason the item cannot be certified, the responsible party for the Open Item, the status of the item (open or closed), the date of opening or closure, and the person verifying that the requirements of the Certifiable Item have been satisfied and that the Open Item has been closed.

The Open Items Lists for Final Design and Construction elements are managed by the D/B Contractors and shall be included in Safety and Security Certification Package submittals to the Authority. Once these Safety and Security Certification Packages are accepted by the Authority the D/B Contractor's Open Items Lists shall be added to the larger programmatic Open Items List and managed by the Authority. The programmatic Open Items List shall be maintained by the Authority Safety and Security Manager and periodically reviewed by the SSPC for progress and completeness.

7.4.8 Conditional Certification

A Contractor desiring to advance their work to the next Project phase may request Conditional Certification Permit from the Authority for certifiable items placed on the Open Items List. The Authority's approval of Conditional Certification may include temporary restrictions or conditions that must be followed until the Certifiable Item is fully certified and removed from the Open Items List. The restrictions or conditions will be documented on the CIL and Open Items List. The request for Conditional Certification will include additional hazard analysis applied by the Contractor as appropriate. The request for Conditional Certification shall be presented to the SSPC for review and SONO. The request for Conditional Certification shall describe all conditions or restrictions associated with the conditional use of the Certifiable Item, including an expiration date. Revisions to the Conditional Certification, including extension of the expiration date, shall require further review and SONO by the SSPC.

8.0 CONSTRUCTION SAFETY AND SECURITY

8.1 Overview

The purpose of the construction safety and security program is to define the minimum health, safety and security requirements to which all participating CHSRP staff, Contractors and subcontractors shall adhere to in fulfilling the Authority's commitment to ensuring a safe and secure construction project. This commitment includes the prevention of job-related injuries and illnesses for the workers engaged in project construction activities, as well as providing safe and secure conditions during construction of the project for the members of the public, who live, work or travel near to the project work areas.

All applicable codes and regulations must be followed by employees engaged in construction activities, including but not limited to the following:

- California Code of Regulations Title 8 Construction Safety Orders
- Federal Railroad Administration regulations as found at 49 CFR 214, 219, 225, 228, 236
- CPUC General Orders
- Other applicable federal and state OSHA regulations

Contractors shall be required to develop a program-level Safety and Security Management Plan (SSMP) specific to their scope of work, as well as Site-Specific Health and Safety Plans (SSHASP) and a Site-Specific Security Plans (SSSP) that identify the local conditions and requirements peculiar to the site and work to be performed, in compliance with the above regulations.

Contractors are responsible for ensuring the compliance of their employees and subcontractor's with their SSMP, SSHASP and SSSP.

8.2 Program Elements

The Contractor shall be responsible for all aspects of safety and security at the project work site, as required through the standard contract provisions. The *CHSRP Construction Safety and Security Program* (Appendix B) describes the basic programmatic requirements for construction safety and security, compliance to which is required through the CHSRP construction contract documents.

8.2.1 Safety and Security Management Plan

The Contractor's SSMP will identify:

- Roles, responsibilities, qualifications and organizational structure of their safety and security team
- Processes to manage the SSHASP and SSPP
- Safety and security hazard management consistent with the Authority's hazard management plan,
- A program for ensuring compliance to the Contractor's SSMP,
- training,
- Safety and security communications plans and processes,
- Processes for coordination with adjacent third-party requirements (including adjacent railroads and roadways),
- Emergency response plans and procedures,
- Hazardous materials handling and communications,
- Public safety requirements, and other safety and security elements as identified in the Contractor's corporate safety and security program.

The SSMP will be submitted to the Authority for review and Statement of No Objection (SONO).

8.2.2 Site-Specific Plans

The Contractor will be required to develop and implement SSHASPs and SSSPs specific to its contract scope of work on the CHSRP, in conformance with the *CHSRP Construction Safety and Security Program* contract requirements. A site-specific Job Hazard Assessment (JHA) and TVA will be performed by the Contractor to determine the safety or security processes, equipment utilized, and personnel assignments to be provided by the Contractor at each project work site.

8.2.3 Construction Safety and Security Management

The RDP Construction Safety Manager and Project Construction Management team will be responsible for the management oversight of the entire construction safety and security program. The RDP Construction Safety Manager and Project Construction Management team will verify contractor compliance with the safety and security requirements of the approved SSMP, SSHASPs, SSSPs, and other safety/security related contract provisions and applicable regulations throughout the construction, testing and start-up phases of the CHSRP. The RDP Construction Safety Manager and Project Construction Management team will audit Contractor activities and results will be reported to the Authority's Safety and Security Manager.

8.2.4 Stop Work Order

The CHSRP construction management plan will establish procedures regarding control of nonconforming work and stop work orders. In the event that a failure to meet safety and/or security requirements results in imminent danger to workers or the general public or property, a Stop Work Order will be issued by the CHSRP Construction Manager.

The CHSRP stop-work procedure shall apply to all construction activities. The stop-work procedure will be used only where imminent danger situations exist. An "imminent danger" is any condition or practice that could reasonably be expected to cause death or serious physical harm immediately or before the danger can be eliminated by normal means.

Stop-work orders will be in effect until the issuing authority determines that the problem(s) is resolved and the work area(s) is brought to satisfactory conformance with health, safety and security requirements.

8.3 Construction Risk Management

The CHSRP is committed to identifying and managing construction safety hazards and security vulnerabilities as subdivisions within the general issue of project risk. Risk in this context includes those events that, if they do occur, could impact safety, security, the environment, CHSP System's interests or the interests of third parties, including property owners and municipalities.

Risk Management is utilized by the CHSRP as a decision support tool, specifically identifying areas of high risks, which are reviewed to ensure that all reasonable practicable measures are taken to mitigate them. Risk Control measures shall be identified for all risks to the System. These include financial and schedule risks as well as property, safety and security risks.

For the construction phase, prior to finalization of the contract documents, surveys to identify any unique hazards, threats, or vulnerabilities that may exist for the particular construction elements will be conducted and actions to mitigate these hazards or vulnerabilities will be included in the Special Provisions of the specific contract package.

During construction, each contractor shall cooperate with CHSRP staff and other interested parties in providing information needed in connection with risk management of its contract works. The contractor will prepare and submit to the RDP Risk Manager a Risk Management Plan for review and acceptance. The Risk Management Plan shall be based upon the CHSRP *Program Risk Management Plan* and shall include a means of monitoring progress in the reduction of the overall number and impact of risks through the use of a Risk Register which shall be in a format acceptable to the RDP Risk Manager. Safety hazards and

security vulnerabilities shall be identified as risks, and will be included as special categories in the Risk Register.

During the contract each contractor's Risk Register shall be updated monthly and submitted to the RDP in hard copy and electronic formats. The risks identified by the contractor shall be integrated into the CHSRP Risk Register.

The Contractor's Risk Management process shall ensure that as far as is reasonably practicable:

- All risks are identified;
- Judgments are made as to risk importance;
- Risk exposure is reduced to acceptable levels;
- Risk control measures are assessed against cost benefit as appropriate; and
- Control measures are reviewed and managed until close out.

For the top "critical" risks from the Risk Register each contractor shall provide a narrative for each Critical risk identified in this category section and the mitigation plan proposed. Safety hazards and security vulnerabilities will be treated as separate categories of risk, and will be classified as Critical depending on specific site conditions.

9.0 STATE SAFETY OVERSIGHT REGULATIONS

9.1 Applicability

The California High-Speed Rail Program does not fall under the Federal Transit Administration applicability regulations for State Safety Oversight, described in 49 CFR 659. As such, this section does not apply. The Federal Railroad Administration has authority for oversight of safety regulations.

10.0 COORDINATION WITH FEDERAL RAILROAD ADMINISTRATION

10.1 Activities

The California High-Speed Rail Program will design and construct a railroad system that is regulated by the Federal Railroad Administration. FRA regulation is by directive under the United States Department of Transportation.

Effective on the date the railroad begins revenue operations, the following generally applicable federal railroad safety regulations from Title 49, Code of Federal Regulations, and any amendments thereto are made applicable to the CHSRP, except where the CHSRP is granted relief through an FRA waiver.

- Part 207, Railroad Police Officers
- Part 209, Railroad Safety Enforcement Procedures
- Part 210, Railroad Noise Emission Compliance Regulations
- Part 211, Rules of Practice
- Part 212, State Safety Participation Regulations
- Part 213, Track Safety Standards
- Part 214, Railroad Workplace Safety
- Part 215, Freight Car Safety Standards
- Part 216, Special Notice and Emergency Order Procedures
- Part 217, Railroad Operating Rules
- Part 218, Railroad Operating Practices
- Part 219, Control of Alcohol and Drug Use
- Part 220, Railroad Communications
- Part 221, Rear End Marking Device
- Part 222, Use of Locomotive Horns at Public highway-Rail Grade Crossings
- Part 225, Railroad Accidents / Incidents: Reports, Classification and Investigations
- Part 227, Occupational Noise Exposure
- Part 228, Hours of Service of Railroad Employees
- Part 229, Railroad Locomotive Safety Standards
- Part 231, Railroad Safety Appliance Standards
- Part 232, Brake System Safety Standards
- Part 233, Signal Systems Reporting Requirements
- Part 235, Instructions Governing Applications for Approval of a Discontinuance
- Part 236 Signal and Train Control Systems, Devices, and Appliances
- Part 237, Bridge Safety Standards
- Part 238, Passenger Equipment Safety Standards
- Part 239, Passenger Train Emergency Preparedness
- Part 240, Qualification and Certification of Locomotive Engineers
- Part 242, Passenger Train System Safety Plans
- Part 270, System Safety Program (under development)

The CHSRP will submit to the FRA any plans, programs, and procedures that affect the safe operation of the system, or which are required to demonstrate compliance with the applicable regulations.

Throughout Preliminary Engineering and Final Design phases the CHSRP will communicate with the FRA to ensure that the FRA is current on the status of operations and engineering design requirements as they are developed. CHSRP will maintain regular contact with FRA during development of operating rules, training of maintenance and operating personnel and development of operating practices prior to the start of revenue service.

As detailed in Section 7 of this SSMP, the CHSRP will manage a safety and security certification program to record and demonstrate that all safety and security requirements for the project are identified and integrated into the final system.

10.2 Implementation

The CHSRP, through the Rail Delivery Partner, will maintain communications with the FRA representatives throughout the Planning, Preliminary Engineering, Final Design, Construction, and Testing and Start-up phases.

10.3 Coordination Process

Interface and coordination with FRA will be conducted through the RDP. The RDP will designate those persons authorized to interface with agents of the FRA to ensure that information and decisions communicated between CHSRP and FRA are consistent, correct and authorized.

The FRA will provide guidance to the RDP with regard to applicable regulations, documents that will require formal submission and approval, and how any variances may be processed.

11.0 DEPARTMENT OF HOMELAND SECURITY COORDINATION

The Transportation Security Administration has authority over all transportation modes and requires that security risk be assessed and managed. During design and construction the Authority will coordinate with TSA and other federal, state and local law enforcement and security jurisdictions to ensure security is considered in design and construction. The Authority will develop a Security Program Plan (SPP) prior to revenue operation. The SPP will fulfill DHS/TSA requirements for an operating railroad, which include development of an SPP, and designating a primary and alternate Security Coordinator and providing TSA with names and contact information for 24 hour/7 days per week availability. The Security Coordinator will have a direct reporting relationship to the Authority Chief Executive Officer regarding matters of security.

The Authority has established liaison with the TSA Mass Transit and Rail Department through the RDP System Security Manager who reports directly to the project operations manager. This liaison has been established to ensure all DHS/TSA requirements will be met once the project is complete, and to stay current with all security concerns, threats, best practices and developing security regulations that affect rail security.

APPENDIX B – CHSRP CONSTRUCTION SAFETY PROGRAM REQUIREMENTS

1.0 CHSRP CONSTRUCTION SAFETY AND SECURITY PROGRAM

1.1 Safety and Security Program Objectives

The Safety and Security Program objectives are as follows:

a. Prevent personal injuries and property damage or loss;

b. Provide safe and secure work environment for employees, contractors, passengers, emergency responders, third parties, and the public at large;

c. To convey the CHSRP Safety and Security Policy Statement to all contractors and subcontractors;

d. To ensure compliance with the stated objectives and requirements contained in the CHSRP Safety and Security Policy Statement, the Contractor's SSHASP, the Contractor's SSSP, Contract provisions, applicable Laws, and industry consensus standards;

e. To identify general requirements for the Contractors' workplace safety and security programs; and

f. To identify a process for the Authority approval or acceptance of the of the safety and security submittals as appropriate.

1.2 Construction Safety and Security

1.2.1 Contractor Responsibilities

The Contractor is responsible for ensuring safety and security at all of its work sites, including the activities of Subcontractors. Safety and security management and enforcement for each contract shall be administered by employees (direct hire) of the Contractor. This responsibility shall not be delegated nor contracted out to Subcontractors, suppliers, consultant service/company, or any other persons/agency without written approval from the Authority. The effectiveness of the Contractor's safety and security efforts depends upon active participation, cooperation, and compliance by the Contractor's and Subcontractors' project managers, superintendents, supervisors, and other employees.

The Contractor shall:

a. Plan and execute all Work to prevent personal injury and property damage or loss, and ensure public safety, security of all people and assets;

b. Comply with Laws, applicable industry consensus standards; and the Authority and Contractor policies, procedures, and requirements;

c. Define, implement, and maintain a program for prompt identification and correction of hazards and unhealthy practices and conditions;

d. Define, implement, and maintain a program for prompt notification and investigation of all incidents of injury, damage, or near-miss incidents to determine causes and take necessary corrective action to prevent re-occurrence;

e. Define, implement and maintain a system of prompt identification, notification, investigation, and correction of security breaches and incidents;

f. Develop, establish, and conduct a safety and security training program for all employees assigned to the Project;

g. Ensure proper tools, equipment, and processes are available for use as required for the work at hand, and are used according to the manufacturer's guidelines;

h. Maintain an accurate record of data utilizing the Authority's integrated Safety Management System for all identified hazards, near-misses, and accidents and incidents resulting in death, personal injury, occupational disease, or damage or loss to property, materials, supplies, or equipment;

i. Plan and execute all Work in compliance with the stated objectives and requirements contained in the CHSRP Safety and Security Policy Statement (contained in the CHSRP SSMP in Book IV, Part D.5); the Contractor's SSHASP and SSSP; Contract provisions; applicable federal, State, and local laws and regulations; and industry consensus standards;

j. Ensure all Subcontractors, suppliers, etc. are provided with a copy of the CHSRP Safety and Security Policy Statement, and the Contractor's SSHASP and SSSP, and are properly informed of their obligations with regards to compliance;

k. Complete safety and security certification requirements as identified in Section 1.2.1:

l. Obtain permits required by the California Division of Occupational Safety. Permits shall be kept on file at the Site;

m. Designate a Safety and Security Manager responsible to ensure the proper implementation of the SSHASP and SSSP and a team of Field Safety Representatives appropriate to the scope of the Project and work to be performed. The Contractor shall demonstrate that their representatives have sufficient knowledge and experience to perform the required duties;

   i. Minimum qualifications for the Safety and Security Manager include:

      - Ten years of heavy civil construction safety experience;
      - Certification as a Construction Health and Safety Technician, Certified Safety Professional, or Certified Safety/Security Director - Rail;
      - OSHA 30-hour Construction Training card; and
      - One year of FRA Roadway Worker Protection qualification per 49 CFR Part 213;
      - The Contractor may propose combinations of the above qualifications that demonstrate sufficient competency for the Safety and Security Manager position;

   ii. Minimum qualifications for the Field Safety Representatives include:

      - Three years of heavy civil construction safety experience;
      - OSHA 30-hour Construction Training card; and
      - First Aid/CPR;

n. Define, implement, and maintain a SSMP for the administration of the SSHASP(s), SSSP(s), and the Safety and Security Team including roles/responsibilities, reporting, and work plan approach; and

o. Contractor shall develop a plan for the use of heavy equipment that, when used, might encroach or otherwise intrude into third party operating space (public or adjacent railway). The plan must address how third party approval for potential encroachment will be achieved and how any safety requirements by third party will be communicated to the operators and responsible parties of the heavy equipment. Third party approvals shall be made available to the Authority for review upon request.

1.2.2 Contractor Deliverables

The Contractor shall submit the following:

a. A SSMP in accordance with the "Safety and Security Management Plan" clause (Section 1.2.3);

b. A SSHASP(s) in accordance with the "Construction Site-Specific Health and Safety Plan Elements" clause (Section 1.2.4);

c. SSSP(s) in accordance with the "Site-Specific Security Plan Elements" clause (Section 1.2.5);

d. A Safety and Security Certification Plan in accordance with Section 7 Safety and Security Certification Program;

e. Site-Specific Hazard Analysis (SiSHA) Reports and Site-Specific Threat/Vulnerability Assessment (SiSTVA) Reports, and an updated Certifiable Elements and Hazards Log, in support of the Contractor's Safety and Security Certification Plan. A SONO of new or revised SiSHAs and SiSTVAs is required prior to commencement of Construction phase activities;

f. A monthly report utilizing the Authority's Integrated Safety Management System of safety performance including a narrative summary of safety activities, hazard identification and mitigation, incidents of injury or property damage incurred, injury rates, incident investigation results, corrective action plans, reports of near-miss incidents, a summary of communication and training efforts, a summary of field audits/observations for safety, a summary of Job Hazard Analyses completed, and other activities as identified by the Contractor; and

g. A monthly report of security performance, including incidents of trespass or security breach, incident investigation results, corrective action plans, a narrative summary of security activities, and other items as identified by the Contractor. The report shall be submitted to the Authority by close of the 5th business day of the following month.

1.2.3 Safety and Security Management Plan

The Contractor shall submit a SSMP to the Authority for review and SONO within 60 days following NTP. The SSMP will identify the qualification and organizational structure of the Safety and Security Team, and the processes that the Team will employ to manage the SSHASP(s) and SSSP(s). The SSMP shall:

a. Describe a process for managing hazards or incident of injury or damage through identification, reporting, and correction or abatement or mitigation, including descriptions for processes and applicability of Job Hazard Analyses (JHA) for each job assignment within the scope of the contract for which a person may be exposed to incidents of injury or illness. JHAs previously performed by the Contractor will be acceptable for use in determining preventive measures if the scope and functionality of the jobs under review are justifiably the same. The previously-performed JHAs, however, must address the specific characteristics of each site and tasks performed within the Project scope. JHAs shall be kept on the Site and made available to the Authority upon request;

b. Describe procedures for work site safety audits and inspections, including assignment of responsibility, frequency, documentation method, and actions following various audit results;

c. Describe the program for Safety and Security Program training employees of the Contractor, Sub-contractors, the Authority, and other applicable third parties. The training program description shall include safety and security program training requirements and documentation including training curriculum, frequencies of and method of delivery for training, training records, a method for identifying and certifying qualified employees, and lists of qualified/competent persons for specific tasks;

d. Describe an employee communication program that identifies individual responsibilities for all employees, schedules for specific communication techniques, and a process for recording and tracking communication program performance. The employee communication program shall include job briefing procedures/requirements, HazComm, employee safety and security committees, Project safety and security committees, and notification process for employees and the Authority of incidents or hazards when identified;

e. Describe a process for identifying applicable health and safety rules and regulations applicable to the tasks to be performed on the Project, including all local, State, and federal occupational safety and health regulations, including but not limited to California Code of Regulations Title 8 Construction Safety Orders, FRA regulations 49 C.F.R. Parts 200-299, California MUTCD, the Contractor's corporate safety plan, and the CHSRP Safety and Security Policy Statement. Rules and procedures shall address Site-specific work activities and conditions including:

   i. Safeguards for the protection of all workers, pedestrians, and the public from excavations, construction equipment, obstructions, and other dangers. Safeguards may include fencing, adequate railings, guard rails, temporary walks, barricades, warning signs, directional signs, overhead protection, planking, decking, danger lights, and other suitable safeguards;
   ii. Personal protective equipment requirements for all work site hazards and conditions, including equipment issuance/availability procedures;
   iii. Mobile equipment operation procedures and training program, including qualification process and requirements, and performance observation/evaluation requirements;
   iv. Fall protection and scaffolding procedures, including minimum fall protection equipment requirements, a process for training workers, and performance observation/evaluation requirements;

v. Motor vehicle operation program, including rules and procedures for specific equipment to be used at the work site (including industrial lift trucks), operator screening and qualification process and requirements, and performance observation/evaluation requirements;
vi. Roadway worker protection (on-track safety) for the Authority ROW in compliance with FRA regulations contained in 49 C.F.R. Part 214;
vii. Hazardous Materials handling and storage plan specific to each work site, including a plan for cataloguing Material Safety Data Sheets and submitting same to the Authority, and for communicating Material Safety Data Sheet information to employees;
viii. Lockout/tagout programs for all applicable energy sources, including electrical, hydraulic, and kinetic; and
ix. Fire prevention and suppression, including procedures for identification of hazards that could lead to fire, procedures for local fire suppression and notification to authorities, inspection processes, and a detailed training and exercise program;

f. Identify, develop, and implement a program for coordinating roadway worker protection activities and compliance with adjacent railroads. All contractors working in the shared corridor will meet frequently with the responsible representatives of the operating railway and coordinate activities to minimize risks and hazards to Contractor personnel, and to avoid hazards or disruptions to the operation of the railway;

g. Describe a process for managing security of Authority properties within the Contractor's Scope of Work. Security program elements shall include at a minimum:

i. Identification of threats and vulnerabilities, reporting, and controls or mitigation. Include process description and applicability of Threat and Vulnerabilities Assessments (TVAs) for each job location within the scope of the contract. Process should include how the processes would adapt in the face of imminent threat or change of security conditions;
ii. Description of how the planned deployment of security measures such as fencing, guards, lighting will be evaluated for initial effectiveness;
iii. Description of an audit and inspection plan to review security measures and ensure that controls are being managed effectively; and
iv. Description of the internal and external (Authority and local law enforcement) reporting structure and process for security incidents, including thresholds for reporting including at a minimum:

- Description of a program for reporting Security incidents. Incident reports for graffiti, vandalism, and trespass to be submitted to the Authority within 48 hours. Incident reports for any significant damage or conditions observed, and any injuries to employees, subcontractors or others will be submitted to the Authority immediately. Security reports submitted weekly to include:, daily security logs noting deployment of security personnel, any significant weather conditions, site locations covered, incident notifications or threats, any noted security equipment conditions (cut fence, broken lights). Copies of an reports from local agencies who respond to incidents on the Authority's property under Contractor control;
- Description of how the background check process will appropriately screen for internal threats to the security of the project Include a description of any code of conduct and expectations for employee behavior, and procedures for internal and external notification when personnel security is violated;
- Description of how the access control to project sites will be applied to ensure the security and control of all project sites including procedures for authorizing new employees or visitors, and procedures for monitoring access control performance;
- Description of the security awareness employee training program, content and schedule including record keeping of training completion;
- Description of the process for ensuring all subcontractors on site adhere to the Contractor's SSMP requirements; and
- A process for recommending enhancements to the Authority's security elements;

h. Identify, develop, and implement an Emergency Response Plan for management of emergency situations associated with, but not limited to, the following: injury to an employee or member of the public; fire; flood; earthquake; property damage and damage to various utilities (such as, electrical, gas, sewage, water, telephone, or public roadways); public demonstrations; sabotage or threats of sabotage; other security incidents or threats, Hazardous Materials encountered; toxic spills; explosions; vehicular accidents; and confined space rescues. The Emergency Response Plan shall include the following items, at minimum:

   i. Identification of the person responsible for handling an emergency;
   ii. Establishment of teams for handling each type of emergency;
   iii. Identification of the person responsible for making emergency call (preferably the ranking Supervisor present);
   iv. The requirement to conspicuously post a list of emergency phone numbers, along with information to be transmitted. Include with the emergency phone numbers, the number of the Authority's representative to be contacted (request telephone number and name of the Authority contact person or persons);
   v. Site identification and signage for emergency responders;
   vi. Trench and confined space rescue plan or tunnel evacuation plan, as applicable;
   vii. The procedure for contacting the Authority Representative when an incident requiring emergency response occurs; and
   viii. Scene management for the emergency response including procedures for ensuring the safety of employees and emergency responders, safeguarding the scene from unwanted entry, and handling on-scene media;

i. Identify, develop, and implement a HAZWOPER Plan for the control of hazardous substances in compliance with California Code of Regulations, Title 8, Section 5192;

j. Identify, develop, and implement a program for ensuring public safety at work sites and avoiding damage to public property. The public shall be considered as any persons and property not employed or owned by the Contractor or its Subcontractors. The program shall address site-specific work activities and conditions including:

   i. Identification of potential hazards to the public;
   ii. Erection and proper upkeep at all times of all necessary safeguards for the protection of the public, including pedestrian and vehicle traffic, and the assignment of trained and competent flaggers whose sole duties shall consist of directing the movement of public traffic through or around the Work site;
   iii. Posting of signs warning against the hazards created by construction or warranty service activities;
   iv. Elimination of unnecessary noise, obstructions, and other annoyances to nearby residents and businesses;
   v. Procedures and competency training for employees assigned to public safety and public property protection; and
   vi. Designated work zones – Work outside of the designated work zones shall be performed only when specifically stated in writing from the Authority Representative;

k. Identify, develop, and implement a program for Temporary Traffic Control. Temporary Traffic Control Plans will be developed in compliance with the requirements of the current California MUTCD. The Contractor shall apply to the jurisdictional authority for approval of the plan and for a permit or permits to work in the public ROW. In cases where there is more than one jurisdictional authority, a separate Temporary Traffic Control Plan will be developed for each jurisdictional authority, as required. The Temporary Traffic Control Plan shall include:

i. Drawings showing proposed traffic control devices including temporary signage and temporary pavement markings and striping;
ii. Different traffic diversion patterns and methods of control. Include for each phase detailed schedules for performance of work and include proposed traffic control devices;
iii. Requirements for flagger training and qualifications, assignment, and supervision;
iv. Notification plans for vehicular, bicycle, and pedestrian traffic detours including notifications of business owners, residents, and property owners in the vicinity of traffic and parking disruptions;
v. Any other requirement of the authority having jurisdiction; and

l. Other safety and security elements as identified in the Contractor's corporate safety and security program.

1.2.4 Construction Site-Specific Health and Safety Plan Elements

The safety processes, equipment utilized, and personnel assignments to be provided by the Contractor at each individual work site may differ based upon a site-specific JHA performed by the Contractor. A SSHASP shall be developed for each distinct and unique work site. The SSHASP will be appropriate to the Project development, phasing, and tasks at hand. It may be submitted incrementally as work is designed and plans are approved for construction and will be revised as the Project evolves. A SONO of new or revised SSHASPs is required prior to the commencement of new work activities. Each SSHASP shall:

a. Be specific to the relevant work site conditions and Project phases for the Work;

b. Be kept on site and made available to all employees, authorized visitors, and the Authority upon request;

c. Include the Contractor's safety and security policy statement;

d. Conform to applicable workplace safety regulations including California Code of Regulations Title 8 Construction Safety Orders, FRA regulations as found at 49 C.F.R. Parts 214, 219, 225, 228, and 236; California Public Utilities Commission General Orders; Federal and State OSHA regulations;

e. Identify roles and responsibilities of all employees for the Contractor and Subcontractors with respect to safety;

f. Identify the reporting and inter-action processes of the Contractor's Safety team with the rest of the Project work force (including Subcontractors and the Authority), and with third parties such as emergency responders, utilities, and adjacent railroad operators;

g. Include a detailed description of site-specific hazards and mitigations. A daily JHA shall be conducted and a plan developed to alter mitigations as daily conditions change;

h. Include a detailed description of site-specific workplace health and safety rules and procedures that conform to all regulatory requirements described in the SSMP;

i. Include a detailed HAZWOPER Plan to be kept on site, available to all employees, authorized visitors, and the Authority upon request;

j. Roadway worker protection for adjacent railroad ROWs – Employees of any CRE working in these locations shall be trained by the Contractor to ensure they become fully familiar with railway operations, procedures, rules, and safety requirements;

k. Include a detailed plan for work site first-aid resources and a training program for employees;

l. Include a detailed Emergency Response Plan. The Emergency Response Plan shall be updated when conditions or procedures change. The Emergency Response Plan will be kept on site;

m. Include a detailed program for ensuring public safety at work sites and avoiding damage to public property, specific to each phase of the work;

n. Include a detailed Temporary Traffic Control Plan for each phase of the work; and

o. Include other elements that conform to the Contractor's corporate health and safety plan.

1.2.5 Site-Specific Security Plan Elements

Security at construction sites is to ensure all personnel working at the site, the Authority's assets and property, and the surrounding communities, are protected from trespassers, vandalism, theft, encroachment and other intentional criminal activity. In compliance with these provisions, the Contractor shall develop a SSSP which shall address crime and security- related conditions specific to the conditions and configuration of the individual work sites. This includes protection of property, materials, tools, equipment, and personal property of workers at specific sites. The SSSP will be appropriate to the Project development, phasing, and tasks at hand. The SSSP may be submitted incrementally as work is designed and plans are approved for construction, and will be revised as the Project evolves. A SONO of new or revised SSSPs is required prior to commencement of new work activities. The types of security to be provided by the Contractor at each site may differ based upon a site-specific security assessment performed by the Contractor.

The SSSP shall include:

a. Safety and security policy statement;

b. Threat and vulnerability assessment process, including how the process will be informed of threat conditions and how specific mitigations or controls will be applied to those potential threats of the construction areas;

c. Identification of the makeup, reporting structure, and inter-action processes of the Contractor's Project Management Team, including the Contractor's Security Management Team, with the rest of the Project work force (including Subcontractors and the Authority) and with third parties such as local law enforcement agencies;

d. Identification of security roles and responsibilities of all employees for the Contractor and Subcontractors;

e. Protection plan of public and property, materials, equipment, and tools based on the outcome of the security assessment through appropriate security applications such as fencing, access control, locks, alarms, intrusion detection, lighting, security guards, and any other security requirements that may be applicable;

f. A description of how access to individual worksites will control who and how employees access the specific sites, how other authorized persons are identified for each work site, and procedures for monitoring site specific access control performance;

g. Coordination program with local law enforcement for incident reporting, and other security-related conditions or events;

h. Procedures for providing site specific security information for inclusion into the Contractor's required project reporting requirements; and

i. Other elements that conform to the Contractor's corporate security plan or the SSMP.

1.2.6 Non-Compliance

The Contractor shall take all necessary corrective actions to avoid the issuance of a stop work order on identification of a safety or security noncompliance. If the Contractor fails or refuses to take corrective action promptly, the Authority may issue an order stopping all or part of the Work until satisfactory corrective action has been taken. The Contractor shall not base any claim or request for equitable adjustment for additional time or money on any stop order issued under these circumstances. The Contractor shall be responsible for its Subcontractors' compliance with this clause.

APPENDIX A 4

ABSTRACT

This memorandum is intended to establish the Safety and Security Policy for the California High-Speed Train System (CHSTS) that will be used as a confirmation of the California High-Speed Rail Authority's (Authority) commitment to plan, design, construct, test and prepare for operating a high-speed train system that operates with a primary focus on safety and security.

1.0 INTRODUCTION

The California High-Speed Rail Authority (Authority) is responsible for certifying the planning, design, construction, testing, and placement into revenue service a safe and secure high-speed train system. The Safety and Security Policy Statement is a high-level confirmation of the Authority's commitment to safety and security.

1.1 PURPOSE OF TECHNICAL MEMORANDUM

The purpose of this technical memorandum is to provide a vehicle for the authorization of the Safety and Security Policy Statement by the Authority.

1.2 GENERAL INFORMATION

Absent federal regulations that govern the completion of major capital projects, the Federal Railroad Administration looks to the Federal Transit Administration (FTA) regulations for guidance. FTA regulations found at 49 CFR 633 requires the development of a *Project Management Plan* (PMP) for every major capital transit project. As described in FTA Circular 5800.1 *Safety and Security Management Guidance for Major Capital Projects*, (dated 8/1/07) a *Safety and Security Management Plan* (SSMP) is the element of the PMP that manages project safety and security activities, responsibilities, and verification processes throughout the project life cycle.

A critical (and required) element of the SSMP, as described in FTA Circular 5800.1, is the Safety and Security Policy Statement.

2.0 DEFINITION OF TECHNICAL TOPIC

2.1 SAFETY AND SECURITY POLICY STATEMENT

It is the policy of the Authority to perform work on the California High-Speed Train System (CHSTS) in a manner that ensures the safety and security of passengers, employees, contractors, emergency responders, and the public. The application of system safety and security comprises a fundamental hazard and vulnerability management process that incorporates the characteristics of planning, design, construction, testing, operational readiness, and subsequent operation of the high-speed rail system. Safety and security are priority considerations in the planning and execution of all work activities on the CHSTS.

All trains, facilities, systems and operational processes must be designed, constructed, and implemented in a manner that promotes the safety and security of persons and property. The design, construction, testing, and start-up of the CHSTS will comply with applicable safety and security laws, regulations, requirements and railroad industry practices. The Authority will maintain or improve upon the public transit and railroad industry standards for safety and security. Through the Reliability, Availability, Maintainability, and Safety (RAMS) Program a standard of safety will be established that is as safe as or safer than conventional U.S. railroad operations and in conformance with the best practices and standards for safety in the international high-speed rail industry. The design, construction, testing, and start-up of the CHSTS will be accomplished in compliance with this standard.

The Authority is committed to providing a safe and secure travel and work environment. Therefore, safety, accident prevention, and security breach prevention must be incorporated into the performance of every employee task. All Authority, Program Management Team, and contractor personnel, subcontractors and employees are charged with the responsibility for ensuring the safety and security of passengers, employees, contractors, emergency responders, and the public who come in contact with the CHSTS. Each individual and organization is responsible for hazard and vulnerability management, for applying the processes that are designed to ensure safety and security, and for maintaining established safety and security standards, consistent with their position and organizational function. Through a cooperative team

effort and the systemic application of safety and security principles, the CHSTS will be designed, constructed, tested, and placed into service in a safe and secure manner.

3.0 SUMMARY AND RECOMMENDATIONS

3.1 RECOMMENDATIONS

It is recommended that the Authority approve and authorize this Safety and Security Policy Statement.

It is recommended that the Program Management Team implements this Safety and Security Policy Statement across all facets of the CHSTS, initially including it in the *Safety and Security Management Plan*, and subsequently in the *System Safety Program Plan* and the *Security and Emergency Preparedness Plan*.

It is recommended that the Safety and Security Policy Statement be included in all construction safety and security contract requirements.

It is recommended that the Authority's CEO signature be affixed to all versions of the Safety and Security Policy statement when published in other documents. See Appendix A.

APPENDIX A

Safety and Security Policy Statement

It is the policy of the California High-Speed Rail Authority (Authority) to perform work on the California High-Speed Train System (CHSTS) in a manner that ensures the safety and security of passengers, employees, contractors, emergency responders, and the public. The application of system safety and security comprises a fundamental hazard and vulnerability management process that incorporates the characteristics of planning, design, construction, testing, operational readiness, and subsequent operation of the high-speed rail system. Safety and security are priority considerations in the planning and execution of all work activities on the CHSTS.

All trains, facilities, systems and operational processes must be designed, constructed, and implemented in a manner that promotes the safety and security of persons and property. The design, construction, testing, and start-up of the CHSTS will comply with applicable safety and security laws, regulations, requirements and railroad industry practices. The Authority will maintain or improve upon the public transit and railroad industry standards for safety and security. Through the Reliability, Availability, Maintainability, and Safety (RAMS) Program a standard of safety will be established that is as safe as or safer than conventional U.S. railroad operations and in conformance with the best practices and standards for safety in the international high-speed rail industry. The design, construction, testing, and start-up of the CHSTS will be accomplished in compliance with this standard.

The Authority is committed to providing a safe and secure travel and work environment. Therefore, safety, accident prevention, and security breach prevention must be incorporated into the performance of every employee task. All Authority, Program Management Team, and contractor personnel, subcontractors and employees are charged with the responsibility for ensuring the safety and security of passengers, employees, contractors, emergency responders, and the public who come in contact with the CHSTS. Each individual and organization is responsible for hazard and vulnerability management, for applying the processes that are designed to ensure safety and security, and for maintaining established safety and security standards, consistent with their position and organizational function. Through a cooperative team effort and the systemic application of safety and security principles, the CHSTS will be designed, constructed, tested, and placed into service in a safe and secure manner

ABSTRACT

The California High-Speed Rail Authority (Authority) is responsible for planning, designing, constructing, testing and preparing for revenue operations a high-speed rail system that is safe and secure. This responsibility is confirmed in the *Safety and Security Policy Statement*.

The Safety and Security Executive Committee (SSEC) allows the Authority to participate in the application of safety and security principles and processes to the California High-Speed Rail System.

This memo is intended to establish the SSEC for the California High-Speed Rail System (CHSRS) in support of the *Safety and Security Management Plan*.

1.0 INTRODUCTION

The California High-Speed Rail Authority (Authority) is responsible for planning, designing, constructing, testing and preparing for revenue operations a high-speed rail system that is safe and secure. The Safety and Security Executive Committee (SSEC) allows the Authority to participate in the application of safety and security principles and processes to the California High-Speed Rail System (CHSRS).

1.1 PURPOSE OF TECHNICAL MEMORANDUM

The purpose of this technical memorandum is to define the scope, duties and responsibilities of the SSEC, identify committee membership and the members' respective responsibilities, and the process by which safety and security-related issues are addressed through the SSEC.

1.2 GENERAL INFORMATION

Absent federal regulations of its own that govern the completion of major capital projects, the Federal Railroad Administration (FRA) looks to the Federal Transit Administration (FTA) regulations for guidance. FTA regulations as stipulated at 49 CFR 633 require the development of a *Project Management Plan* (PMP) for every major capital transit project. As described in *FTA Circular 5800.1 Safety and Security Management Guidance for Major Capital Projects*, a *Safety and Security Management Plan* (SSMP) is the element of the PMP that details the processes for managing project safety and security activities, responsibilities, and verification processes throughout the project life-cycle.

A required element of the SSMP, as also described in FTA Circular 5800.1, is a description of committees identified to support the SSMP. The Committees may carry over to revenue operations through inclusion in the *System Safety Program Plan* and *Security and Emergency Preparedness Plan*. This SSEC Charter is designed to satisfy the requirement with respect to the SSEC.

2.0 DEFINITION OF TECHNICAL TOPIC

2.1 SSEC GOAL AND PURPOSE

The SSEC and its members will ensure that the CHSRS is designed, built, and implemented in a safe and secure manner. The SSEC will achieve this goal by providing oversight of the application of the SSMP through all phases of the CHSRS development and to act as a conduit to informing and assuring Authority executive management of safety and security issues affecting the CHSRS.

2.2 AUTHORITY

The authority for the SSEC is established in the SSMP. The SSEC Charter will be modified as necessary as the development of the CHSRS progresses.

2.3 SCOPE

The SSEC will address safety and security issues which:

- Are Authority policy considerations;
- Require Authority approval;
- Require Authority direction for resolution of a dispute; or,
- Constitute final acceptance of Safety and Security Certification.

2.4 DUTIES AND RESPONSIBILITIES

The duties and responsibilities of the SSEC are as follows:

- Approve revisions/updates to the SSMP

- Oversee the application of the SSMP through all CHSRS development phases
- Authorize the establishment of the Safety and Security Program Committee (SSPC), comprised of representatives from the Authority and the Rail Delivery Partner (RDP)
- Review and approve regular reports of safety and security activities from the SSPC
- Review and discussion of field safety and security activities, incidents, trends, and future developments
- Resolve safety and security issues that cannot be resolved at the SSPC level
- Review Safety and Security Certification (SSC) Certificates of Conformance and accept final Certification Verification Report to certify that the System is safe and secure for revenue operation
- Provide a forum for safety and security discussions among Authority and RDP Executive Management

2.5 MEMBERSHIP

Voting members of the SSEC include the following persons:

- Chief Executive Officer (Chair)
- Director of Risk Management and Project Controls (Vice-Chair)
- Regional Directors (Northern California, Central Valley, Southern California)
- Chief Program Manager, Rail Operations and Maintenance
- Chief Counsel
- Program Director, Program Delivery
- Chief Administrative Officer
- Chief Engineer

Advisory members include:

- Safety & Security Risk Manager
- System Safety Manager
- System Security Manager (Committee Coordinator)
- Construction Safety and Security Manager

The Chairperson of the SSEC is the Authority Executive Director or a designated Authority executive management representative. If a designated member of the SSEC is unable to attend a SSEC meeting, they must assign an appropriate representative.

2.6 MEETINGS

The SSEC will meet at least quarterly at a regular time and location determined at the previous meeting. The Chairperson (or designee) will conduct the meeting according to the published agenda. The meeting may be postponed or rescheduled by the Chairperson due to the availability of the membership.

The RDP System Security Manager will act as Coordinator and will be responsible to notify all SSEC members of the time, date, location, and agenda in advance of the meeting. The Coordinator will also distribute any support material pertinent to the meeting.

To validate meetings and the business conducted therein, a quorum of members must be present at the meeting. Decisions will also be decided by a quorum of the members. Regular committee members may designate alternate representatives. A quorum is a simple majority of the membership.

Special meetings may be called on an exceptional basis at the direction of the Chair or designee to discuss matters of urgency. In these cases, the Coordinator will notify all members in writing of the date, time, place and purpose of the meeting at least 48 hours in advance if possible.

The Coordinator will ensure a record is kept of all proceedings of the Committee and maintain an action items matrix showing resolutions and pending items. The Chairperson will designate a person responsible for follow up of the action items as required.

The Coordinator will post meeting minutes, action items matrix, and supporting material accessible to all SSEC members within two weeks following each meeting. Meeting minutes, an action items matrix, and supporting forms shall be retained by the SSEC Coordinator in accordance with the Authority's Record Retention Policy.

ABSTRACT

The California High-Speed Rail Authority is responsible for planning, designing, constructing, testing and preparing for operating a high-speed train system that is safe and secure. This responsibility is confirmed in the *Safety and Security Policy Statement*.

The Safety and Security Executive Committee allows the Authority to participate in the application of safety and security principles and processes to the development of the California High-Speed Rail System through the Safety and Security Program Committee, which operates at the project level.

This memo is intended to establish the Safety and Security Program Committee for the CHSRS in support of the *Safety and Security Management Plan*.

1.0 INTRODUCTION

The California High-Speed Rail Authority (Authority) is responsible for planning, designing, constructing, testing and preparing for revenue operations of a high-speed train system that is safe and secure. Under the direction of the Authority, the Rail Delivery Partner (RDP) is responsible for working with the Authority to develop, implement, and manage the safety and security initiatives that are described in the *Safety and Security Management Plan* (SSMP).

The Safety and Security Program Committee (SSPC) allows the CHSRA/RDP to implement the SSMP throughout the California High-Speed Rail System (CHSRS).

1.1 PURPOSE OF TECHNICAL MEMORANDUM

The purpose of this technical memorandum is to define the scope, duties and responsibilities of the SSPC, identify committee membership and the members' respective responsibilities, and the process by which safety and security-related issues are addressed through the SSPC.

1.2 GENERAL INFORMATION

Absent federal regulations that govern the completion of major capital projects, the Federal Railroad Administration looks to the Federal Transit Administration (FTA) regulations for guidance. FTA regulations as stipulated at 49 CFR 633 require the development of a *Project Management Plan* (PMP) for every major capital transit project. As described in *FTA Circular 5800.1 Safety and Security Management Guidance for Major Capital Projects*, a *Safety and Security Management Plan* (SSMP) is the element of the PMP that details the processes for managing project safety and security activities, responsibilities, and verification processes throughout the project life-cycle.

A required element of the SSMP, as also described in FTA Circular 5800.1, is a description of committees identified to support the SSMP. The Committees may carry over to revenue operations through inclusion in the *System Safety Program Plan* and *Security and Emergency Preparedness Plan*. This SSPC Charter is designed to satisfy the requirement with respect to the Safety and Security Program Committee.

2.0 DEFINITION OF TECHNICAL TOPIC

2.1 SSPC GOAL AND PURPOSE

The SSPC and its members will ensure that the CHSRS is designed, built, and implemented in a safe and secure manner at the project level. The SSPC will achieve this goal by providing oversight of the application of the SSMP through all phases of CHSRS development and to act as a conduit to informing and assuring Authority executive management (through the SSEC) of safety and security issues affecting the CHSRS.

2.2 AUTHORITY

The authority for the Safety and Security Program Committee is established in the *Safety and Security Management Plan* (SSMP). The SSPC Charter will be modified as necessary as CHSRS development progresses.

2.3 SCOPE

The SSPC will address safety and security issues which:

- Are directed it by the SSEC;
- Are appropriate for or require resolution at the Program level;
- Require elevation to the SSEC for Authority direction for resolution; or,
- Constitute preliminary review and acceptance of Safety and Security Certification.

2.4 DUTIES AND RESPONSIBILITIES

The duties and responsibilities of the SSPC are as follows:

- Recommend to the SSEC the initial version of the SSMP and subsequent updates

- Oversee the application of the SSMP through all CHSRS development phases
- Review and forwarding to the SSEC with recommendation for approval of Preliminary Hazard Analyses and Threat/Vulnerability Assessments as they are developed or updated
- Tracking of identified hazards or vulnerabilities through the hazard/vulnerability tracking database
- Review and discussion of field safety and security activities, incidents, trends, and future developments
- Provide regular reports of safety and security activities or issues to the SSEC
- Forward to the SSEC for resolution any safety and security issues that cannot be resolved at the SSPC level
- Review of Safety and Security Certification (SSC) Certificates of Conformance and a Final Certification Verification Report
- Forward SSC Certificates of Conformance and a final Certification Verification Report with recommendation to the SSEC for Authority acceptance
- Provide a forum for safety and security discussions among CHSRA/RDP staff members and a conduit for safety and security issues to the Authority through the SSEC

2.5 MEMBERSHIP

The SSPC comprises the following persons:

- Director of Risk Management and Project Controls (Chair)
- Safety and Security Risk Manager (Vice-Chair)
- System Safety Manager (Committee Coordinator)
- System Security Manager
- Construction Safety and Security Manager
- Director of Operations and Maintenance
- Deputy Director Operations & Maintenance
- Director of Engineering
- Director of Construction Support
- Director of Network Integration
- Rail Engineering Manager
- Trainset Project Manager
- Regional Directors of Projects (Northern, Central, Southern)
- Director of Environmental Services
- Director of Real Property
- Legal Services

Designated members of the SSPC are responsible for assigning an appropriate representative if they are unable to attend a SSPC meeting.

2.6 MEETINGS

The SSPC will meet at least monthly at a regular time and location. The Chairperson (or designee) will conduct the meeting according to the published agenda. The meeting may be postponed or rescheduled by the Chairperson due to the availability of the membership.

The Coordinator will be responsible for notifying all SSPC members of the time, date, location, and agenda in advance of the meeting. The Coordinator will also distribute any support material pertinent to the meeting.

To validate meetings and the business conducted therein, a quorum of members must be present at the meeting. Decisions will also be decided by a quorum of the members. Regular committee

members may designate alternate representatives. A quorum is a simple majority of the membership.

Special meetings may be called on an exceptional basis at the direction of the Chairperson or his/her designated representative to discuss matters of urgency. In these cases, the Coordinator will notify all members in writing of the date, time, place and purpose of the meeting at least 48 hours in advance if possible.

The Coordinator will record all proceedings of the Committee and maintain an action items matrix showing resolutions and pending items. The Chairperson will designate a person responsible for follow up of the action items as required.

The Coordinator will distribute meeting minutes, an action items matrix, and supporting forms to all SSPC members via e-mail within one week following each meeting. Members have one week to advise the Coordinator of any inaccuracies. A copy of meeting minutes, an action items matrix, and supporting forms shall be retained by the Coordinator in accordance with the Authority's Record Retention Policy.

4.0 POLICY RECOMMENDATION 4

ABSTRACT

This Technical Memorandum (TM) establishes the Fire and Life Safety and Security Program, including the establishment of Regional and System Fire and Life Safety and Security Committees.

1.0 PURPOSE

The purpose of this Technical Memorandum (TM) is to establish the approach the California High-Speed Rail Authority (Authority) will take with respect to fire and life safety and security issues in the development and implementation of the California High-Speed Train System (CHSTS), and to provide a medium for the authorization of the Fire and Life Safety and Security Committees.

2.0 BACKGROUND

The identification of design criteria that specifically addresses fire and life safety issues is a critical component of the development and operation of passenger rail transit systems. Involving emergency response agencies (both systemically and locally) in the development of fire and life safety design criteria and operating practices assures the Authority and the passenger railroad operator that emergency response infrastructure, equipment and procedures are designed, constructed/installed, and implemented to an acceptable level of safety.

Security has been added to the traditional fire and life safety scope in order to bring together all local emergency response agencies into one forum. This strategy allows the Authority to capitalize on commonalities among emergency response agencies as a force multiplier, increasing lines of communication while maximizing CHSTS resources.

Absent federal regulations that govern the completion of major capital projects for railroad systems, the Federal Railroad Administration looks to the Federal Transit Administration (FTA) regulations for guidance. FTA regulations as stipulated at 49 CFR 633 require the development of a *Project Management Plan* (PMP) for every major capital transit project. As described in *FTA Circular 5800.1 Safety and Security Management Guidance for Major Capital Projects*, a *Safety and Security Management Plan* (SSMP) is the element of the PMP that details the processes for managing project safety and security activities, responsibilities, and verification processes throughout the project life-cycle.

A required element of the SSMP, as also described in FTA Circular 5800.1, is a description of committees identified to support the SSMP. The Committees may carry over to revenue operations through inclusion in the *System Safety Program Plan* and *Security and Emergency Preparedness Plan*. This Fire and Life Safety and Security Program is designed to satisfy the requirement with respect to the Fire and Life Safety and Security Committees.

3.0 FIRE AND LIFE SAFETY AND SECURITY PROGRAM

3.1 Purpose

The purpose of the Fire and Life Safety and Security (FLSS) Program is to assure that fire and life safety and security considerations are integrated into the CHSTS design criteria, programs, procedures, and communications to the maximum extent possible.

Fire and Life Safety and Security Committees (FLSSC) will be established for the purpose of engaging emergency response agencies, at both state and regional levels, to acquire their input with regard to CHSTS designs that mitigate identified hazards. The FLSSC are essential to fostering a professional, friendly, collaborative relationship with the local emergency response agencies, helping to facilitate final permit approval and issuance of Certificates of Occupancy for successful implementation of revenue service. The goal of these committees is to provide a forum for emergency response agencies to provide input and feedback to the Authority concerning fire and life safety and security issues in a formal and consistent manner.

3.2 Scope

The scope of the FLSSC during the Planning, Preliminary Engineering and Final Design project phases will focus on infrastructure and systems design requirements. For the CHSTS, security is added to the traditional fire and life safety scope in order to bring together all local emergency response agencies to one forum. Operational procedures, emergency response procedures, and training requirements and exercises will be considered by the FLSSC during the Construction and Testing/Startup project phases.

Security will remain an integral part of the FLSS Program during the Planning, Preliminary Engineering and Final Design project phases. Separate Security Committees may be established when considered appropriate by the Authority.

Two approaches are executed for the Fire and Life Safety and Security Committees: Regional Committees and a Statewide Committee to address state-level issues.

The Authority's safety and security managers will have primary responsibility for administering the FLSS Program including interactions with local, regional, and statewide emergency response agencies, and holding chairperson positions within the various FLSS committees.

3.2.1 Statewide FLSSC

The one Statewide FLSSC will focus on systemic, high-level, fire and life safety and security issues including Federal and State codes or requirements impacting the regional efforts. A goal of the Statewide FLSSC is to obtain concurrence from federal and state authorities with respect to fire and life safety and security concerns.

The Statewide FLSSC will include representatives from state and federal agencies such as the Office of the State Fire Marshal, California Highway Patrol, Office of Emergency Services, the California Emergency Management Agency, CPUC, FRA, and DHS as well as a representative from each Regional FLSSC. The Statewide FLSSC will be chaired by the Authority's Safety and Security Manager(s). Meetings will be held regularly in Sacramento with agendas, minutes, and other support materials supplied by the committee Chair. Minutes and action items from the meetings will be conveyed to the Regional FLSSC's and to the Safety and Security Program Committee for their consideration. It is anticipated that these Statewide FLSSC meetings will be held quarterly.

3.2.2 Regional FLSSC

Each Regional FLSSC will focus on the CHSTS characteristics specific to their corridor segments (type/length of underground and elevated structures, access methods, terminals, etc.) to provide input with respect to local building codes or requirements that are in line with the emergency response characteristics and capabilities of the local agencies. A goal of the Regional FLSSC is to obtain concurrence from local emergency response agencies with respect to the proposed designs and the code requirements of the state and federal authorities having jurisdiction.

The Regional FLSSC will be comprised of appropriate representatives (e.g., Fire Marshal) from local emergency response agencies (fire, police, emergency medical response) and will be chaired by the Authority's Safety and Security Manager(s), and include the Authority's Regional Director for the region. Meetings will be held regularly at a location local to the regional corridor, with agendas, minutes, and other support materials supplied by the committee Chair. Minutes and action items from the meetings will be conveyed to the Statewide FLSSC and to the Safety and Security Program Committee for their consideration. It is anticipated that these Regional FLSSC meetings will be held bi-monthly, alternating with the Statewide FLSSC.

One representative from each Regional FLSSC will be asked to participate in the Statewide FLSSC. Consistent representation is critical to success. Each Regional representative must be the same representative attending to Statewide FLSSC matters and reporting results to their specific Regional Committee.

3.3 Fire and Life Safety and Security Report

The input gathered through the FLSSC will support the development of Preliminary Hazard Analysis, Threat and Vulnerabilities Assessments, and other analyses as required and in conformance with the CHSTS Safety and Security Management Plan. The results of these analyses will be used to develop safety and security design criteria and operational procedures, all of which will be assured through the Verification & Validation process. A Fire and Life Safety and Security Report will be developed to describe the system-level strategies, mitigations, and processes implemented to achieve an acceptable level of fire and life safety. The Fire and Life Safety and Security Report will be updated as conditions change or as new information is acquired through the FLSSC.

4.0 POLICY RECOMMENDATION

It is recommended that Authority implement a Fire and Life Safety and Security Program for the CHSTS by appending this Technical Memorandum to the CHSTS Safety and Security Management Plan (SSMP). It is also recommended that this Technical Memorandum is appended to both the System Safety Program Plan (SSPP) and Security and Emergency Preparedness Plan (SEPP) when they are developed prior to the initiation of revenue service.

It is recommended that Regional FLSSCs be established in the Initial Construction Segment between Fresno and Bakersfield. It is also recommended that the Statewide FLSSC be established in Sacramento, California. All committees should be established as soon as possible in order to integrate FLSS input to the development of design criteria.

This Policy will be modified as design and construction progresses to fit the specific needs of the immediate phase of the project segments.

Appendix G

Hazard Analysis Descriptions

Preliminary Hazard Analysis (PHA)

The primary output of the PHA is the early identification and evaluation of hazards and mitigations on a high-level systems requirement basis. The following instructions are used in the development of the Preliminary Hazard Analysis:

PURPOSE	**The purpose of the PHA is to provide an early assessment of the hazards associated with a design or concept.**
PROCEDURE	**The PHA identifies critical areas, hazards and criteria being used and considers: hazardous events, components, interfaces, environmental constraints, and operating, maintenance and emergency procedures.** **When possible, the corrective action should identify the approach(s) to be taken: design change, procedures, and special training and personnel qualifications.**
RESULTS	**The PHA will provide for verification that corrective or preventive measures or procedures are taken in safety reviews, modification of specifications, and generation of methods and procedures to eliminate, minimize or control hazards and provide inputs to the interface hazard analysis, operating hazard analysis and failure mode and effects analysis.**
DOCUMENTATION	**Document the analysis to show compliance with the specified safety and operational requirements, and provide for the tracking of actions and verifying effectiveness. A PHA Report will be developed where appropriate to document the analysis process for specific subsystem hazards.**

Sample PHA

System: Infrastructure				**California High-Speed Train Project**				**Prepared by:** John Cockle **Date** 5-Feb-14		
Subsystem: R-O-W, Generally				**Preliminary Hazard Analysis (PHA)**				**Reviewed by:** Gulzar Ahmed **Date** 5-Feb-14		
PHA No. 1.1.1 **Rev No.** 0								**Approved by:** **Date**		
General Description Derailment				**Hazard Cause / Effect**		**Hazard Risk Index**		**Corrective Action**		
No.	**Sys Mode**	**Site Speci-fic**	**Hazard Description**	**Potential Cause**	**Effect on Subsystem / System**	**Initial**	**Residual (Projected)**	**Potential Controlling Measures**	**Resolution**	**Remarks**
4	Normal	Yes	Washout	Flooding, scouring	Derailment w/mass casualties, property damage, service interruption	[redacted]	I-E Acceptable w/Review	1) Perform hydraulics analysis and incorporate results into sub-grade design, slope protection and setting of profile. 2) Install scour protection (revetment or other structure) to protect sub-grade from water course. 3) Install culvert or bridge structure where crossing water course. 4) Identification and monitoring by O&M of potential hazardous locations.	1) Perform hydraulics analysis and incorporate results into sub-grade design, slope protection and setting of profile. 2) Install scour protection (revetment or other structure) to protect sub-grade from water course. 3) Install culvert or bridge structure where crossing water course. 4) Identification and monitoring by O&M of potential hazardous locations.	Identified 8/30/11. Improvement in frequency to *Highly Unlikely*, but not eliminated. No effect on severity of a derailment if it does occur. 12/2013: Mitigation and Resolution # 4 added during the Verification and Validation process

Note – This is a sample representation only. Refer to current PHA for identified hazards and controlling measures.

INSTRUCTIONS FOR COMPLETING THE PHA FORM:

- **In System, enter the nomenclature of the applicable system element (e.g. Infrastructure, Train Control, Communications, Rolling Stock, etc).**

- In Subsystem, enter the nomenclature of the subsystem as broken out from the system and which includes the item or hazard undergoing PHA.
- In PHA No., enter the PHA number for the subsystem element. This coding will be sequentially numbered by each Contractor for each subsystem and will be utilized for all related analysis.
- In Rev. No., enter the revision number of the PHA to indicate the latest status.
- In Prepared by _ Date _, the preparer will sign and enter the date of issue or revision of the analysis.
- In Reviewed by _ Date _, the reviewer will enter the date of review.
- In Approved by _ Date _, enter the date of approval by the SSPC or SSEC as appropriate.
- In No., enter the reference number which uniquely identifies the high-speed rail system element and any identifiable element subsystem and item being analyzed.
- In System Mode, enter state of the system when the failure mode or hazardous condition occurs.
- In HAZARD DESCRIPTION, describe an immediate condition which could lead to an accident involving potential injury, death or equipment damage.
- In POTENTIAL CAUSE, enter the most likely primary and secondary causes that can potentially contribute to the presence of the hazard.
- In EFFECT ON SUBSYSTEM / SYSTEM, describe the effect that the hazardous condition may have on the system element or its element subsystem in terms of safety (e.g. delay, inconvenience, injury, damage, fatality, etc.)
- In HAZARD RISK INDEX, enter a combination of the qualitative measure of the worst potential consequence resulting from the hazard, and its probability of occurrence (e.g., IA, IIB, etc.), under the following conditions:
    - In INITIAL, enter the designation for hazard risk index estimated prior to implementation of the controlling measures, considering the condition of the subsystem element if no measures of mitigation were applied.
    - In RESIDUAL (PROJECTED), enter the designation for hazard risk index estimated following the adoption/implementation of the proposed controlling measures. This may result in reduction of either the probability of occurrence or the severity of the hazard, or both.
- In POTENTIAL CONTROLLING MEASURES AND REMARKS, describe the proposed measures of mitigation that can be applied to prevent or reduce the severity and probability of the hazard under analysis.
- In RESOLUTION / RESOLUTION, describe changes made or steps taken relative to design and/or procedures, training, etc., to eliminate or control the hazard. The identified reference should be as specific as possible for verification purposes.
- In REMARKS, identify the date that the hazard was initially analyzed, any subsequent analysis, and other items that support or describe the analysis process.

Site-Specific Hazard Analysis (SiSHA)

The SiSHA is conducted as the general design criteria and system requirements are applied to specific system and subsystem elements within a defined geographic area. The standard SiSHA segment will be one mile in length, but can be shorter if specialized conditions require. SiSHA is systemic in that it includes ALL hazards and mitigations that are found within the segment under consideration, analyzing the relationship between the various hazards and mitigations. SiSHA is performed when the final alignment is identified during the Preliminary Engineering Phase and in advance of the Final Design, Construction, and Testing/Startup Phases. The primary output of the SiSHA is a validation of the PHA mitigations in relation to the segment under consideration, and the identification and evaluation of hazards and mitigations that are specific to the segment under consideration.

The instructions and format for completing the SiSHA form are the same as for the PHA form.

Failure Mode and Effects Analysis (FMEA)

PURPOSE

The purpose of the FMEA is to determine the results or effects of item failures on a system operation and to classify each potential failure according to its risk index (severity and frequency of occurrence). The goal is to provide an early identification of failures with unacceptable and undesirable risks so that they can be eliminated or minimized through appropriate actions at the earliest possible time.

PROCEDURE

Variations in design complexity and available data will generally dictate the analysis approach to be used. There are two primary approaches for accomplishing an FMEA, the hardware approach and the functional approach.

The hardware approach is normally used when hardware items can be uniquely identified from schematics, drawings, and other engineering and design data. The hardware approach is normally utilized in a parts-level up fashion (bottom-up approach), by listing individual hardware items and analyzing the effect of their possible failure modes on the entire system and its subsystems.

The functional approach is normally used when hardware items cannot be uniquely identified or when system complexity requires analysis from the initial indenture level downward through succeeding indenture levels (top-down approach). The functional approach recognizes that every item is designed to perform a number of functions that can be classified as outputs. The outputs are listed and their failure modes analyzed.

The FMEA may be performed as a hardware analysis, a functional analysis, or a combination analysis depending on the design detail available.

The FMEA will examine the system element by element, to evaluate the system for safety hazards and ultimately to assess risk. Each identified failure mode will be assigned a severity classification. A probability of occurrence will also be assigned in accordance with MIL-STD-882E The resulting risk index will be utilized during design to establish priorities for corrective actions. The FMEA will be reviewed on a continuous basis to verify that design modifications do not add hazards to the system.

To perform a FMEA, the following process should be implemented:

- Identify all major system components, functions, and processes
- Determine consequences of interest
- Determine the potential failure modes of interest
- Specify effects of failures of system
- Identify safety provisions to control hazards and failures
- Identify detection methods for failures
- Establish overall significance of each failure

RESULTS	The FMEA will provide information to evaluate identified hazards, identify safety critical areas and provide inputs to safety design criteria and procedures with provisions and alternatives to eliminate or control all unacceptable and undesirable hazards based on their combination of severity and probability of occurrence, and to identify critical items.
DOCUMENTATION	Document the analysis to show compliance with specified system safety requirements and to track the corrective action.

Fault Tree Analysis (FTAn)

PURPOSE

The Fault Tree Analysis (FTAn) is a deductive procedure used to determine the various combinations of hardware and software failures and human errors that could cause undesired events (referred to as top events) at the system level. The FTAn has much use because of its ability to distinguish between those events that must occur (represented by an AND gate) and those that simply can occur (represented by an OR gate) in order for the top event to occur. The analysis thus helps to identify potential causes of system failures before the failures actually occur. The deductive analysis begins with a general conclusion, then attempts to determine the specific causes of the conclusion by constructing a logic diagram called a fault tree. After completing an FTAn, efforts can be directed to improve system safety.

PROCEDURE

The FTAn will be conducted on unresolved, undesirable, or unacceptable hazards identified in other safety analyses. Following procedure will be used to do a comprehensive FTAn:

1. Define the undesirable/unacceptable hazard, and write down the top level event.
2. Using technical information and professional judgments, determine the possible reasons for the top level event to occur. These are level two elements because they fall just below the top level event in the tree.
3. Continue to break down each element with additional gates to lower levels. Consider the relationships between elements to help decide proper selection of the logic gate.
4. .Finalize and review the complete diagram. The chain can only be terminated in a basic fault: human, hardware software.
5. If possible, evaluate the probability of occurrence for each of the lowest level elements and calculate the statistical probabilities from the bottom up.

RESULTS

The information charted on a fault tree provides a qualitative analysis by demonstrating how specific events will affect an outcome. If probability data is known for these events, then the FTAn can also provide quantitative information to further evaluate the likelihood of achieving the top event. Once developed, the fault areas that are responsible for yielding an undesired event can be further evaluated.

DOCUMENTATION

Document the analysis to show compliance with specified system safety requirements and to track the corrective action.

Interface Hazard Analysis (IHA)

PURPOSE	The IHA identifies and assesses existing or potential hazards between subsystems and systems and their effect on overall System safety and operations. The emphasis is on interfaces. Through the early identification of existing or potential hazards, corrective action(s) can be taken to eliminate or control unacceptable and undesirable hazards, based on the combination of their hazard severity and probability of occurrence.
PROCEDURE	The IHA is conducted on the critical interrelationships of each subsystem and system to determine the cause and effect of possible independent, dependent and simultaneous failures that could present a hazardous condition, including failures of safety devices. When the IHA indicates a potential problem, it is made known to the responsible engineer in order to initiate a design review. The IHA will be reviewed on a continuous basis to verify that design modifications do not add hazards to the system.
RESULTS	The IHA provides for the identification and correction of possible hazards associated with subsystem and system failures. The IHA provides inputs to design reviews, maintainability, reliability and system safety and system operations.
DOCUMENTATION	Document the analysis to show compliance with specified system safety requirements and to track the corrective action.

Operating Hazard Analysis (OHA)

PURPOSE	The purpose of the OHA is to identify and analyze hazards associated with personnel and procedures during production, installation, testing, training, operations, maintenance and emergencies.
PROCEDURE	The OHA will be conducted on all tasks and human actions, including acts of omission and commission, by persons interacting with the system, subsystems and assemblies at any level. When the OHA indicates a potential safety hazard, it will be made known to the responsible engineer, in order to initiate a design review or a system safety working group action item. The OHA will be reviewed on a continuous basis to provide for design modifications, procedures, testing, etc., that do not create hazardous conditions.
RESULTS	The OHA will provide for corrective or preventive measures to be taken to minimize the possibility that any human error or procedure will result in injury or system damage. The OHA will provide inputs for recommendations for changes or improvements in design or procedures to improve efficiency and safety, development of warning and caution notes to be included in manuals and procedures, and the requirement of special training of personnel who will carry out the operation and maintenance of the system.
DOCUMENTATION	Document the analysis to show compliance with specified system safety and operational requirements.

Software Hazard Effects Analysis (SHEA)

PURPOSE

The Software Hazard Effects Analysis (SHEA) is a software design evaluation and validation tool used to identify errors generated from incorrect or inadequate specifications of software functions. A software fault causing a resultant harmful system function is a software hazard.

Software faults can be described in three forms:

- Error generated through coding the software
- Faults due to incorrect software specifications implemented by the function developer
- Faults due to hardware failures that affect changes in coding software

A software hazard can be any of four types:

- An undesired signal causing an unwanted event
- An undesired signal causing an out-of-sequence event in the response
- An undesired signal preventing the occurrence of a necessary action or response
- An undesired signal causing an event to be out of tolerance

The SHEA concentrates on potential safety problem areas in the software. The purpose of the SHEA is to provide an early study of the software design for possible hazards and to initiate appropriate actions to eliminate/ control hazards.

PROCEDURE

The initial step in the analysis is to identify the safety critical areas of the system and their functional paths. These paths may contain hardware as well as software elements. Focus the analysis on the software functions within each system functional flow path. Whether the coded instructions are stored in software or firmware, analysis of the system in question for hazardous occurrences should include an analysis of the stored coded instructions.

The SHEA will be conducted on identified software fault conditions, and will proceed from a qualitative to a quantitative analysis as the design develops. When the SHEA indicates a potential problem, it will be made known to the responsible engineer in order to initiate proper action. The SHEA will be reviewed on a continuous basis to verify that software design modifications do not add hazards to the system.

The SHEA should be developed in conjunction with FMEA.

RESULTS

The SHEA will provide information to evaluate identified software related hazards, identify safety critical areas in software design and provide inputs to safety design criteria and procedures. The latter will include provisions and alternatives to eliminate or control all unacceptable and undesirable software related hazards based on their combination of severity and probability of occurrence, and to identify critical items.

DOCUMENTATION

Document the analysis to show compliance with the specified system safety requirements and to track the corrective action.

APPENDIX 2-I: ALTERNATIVES CONSIDERED DURING ALTERNATIVES SCREENING PROCESS

APPENDIX 2-I: ALTERNATIVES CONSIDERED DURING ALTERNATIVES SCREENING PROCESS

The project-level environmental review process for the San Jose to Merced Project Section commenced in 2009 with a notice of intent (NOI), a notice of preparation (NOP), and an agency and public scoping process.

The alternative development and consideration process was iterative from 2009 to 2017 as illustrated on Figure 1. The California High-Speed Rail Authority (Authority) solicited public and agency comments on the range of alternatives that should be studied in the environmental impact report/environmental impact study (EIR/EIS) multiple times, including the National Environmental Policy Act (NEPA)/California Environmental Quality Act (CEQA) scoping period, during alternative analysis document preparation in 2010 through 2013, and when the project analysis shifted focus to the San Jose to Central Valley Wye Project Extent in 2016 and 2017. Interagency coordination also informed the development of alternatives for consideration. After analysts identified the initial group of potential alternatives, they developed plans, concepts, and cross sections as necessary to support early consideration. Initial alternatives were developed and screened in coordination with the NEPA/404/408 Integration process.

NEPA/404/408 Integration Process

The MOU between the FRA, the Authority, USACE, and USEPA establishes a three-part "checkpoint" process for integrating NEPA and the requirements of Clean Water Act Section 404 and Rivers and Harbors Act Section 408:

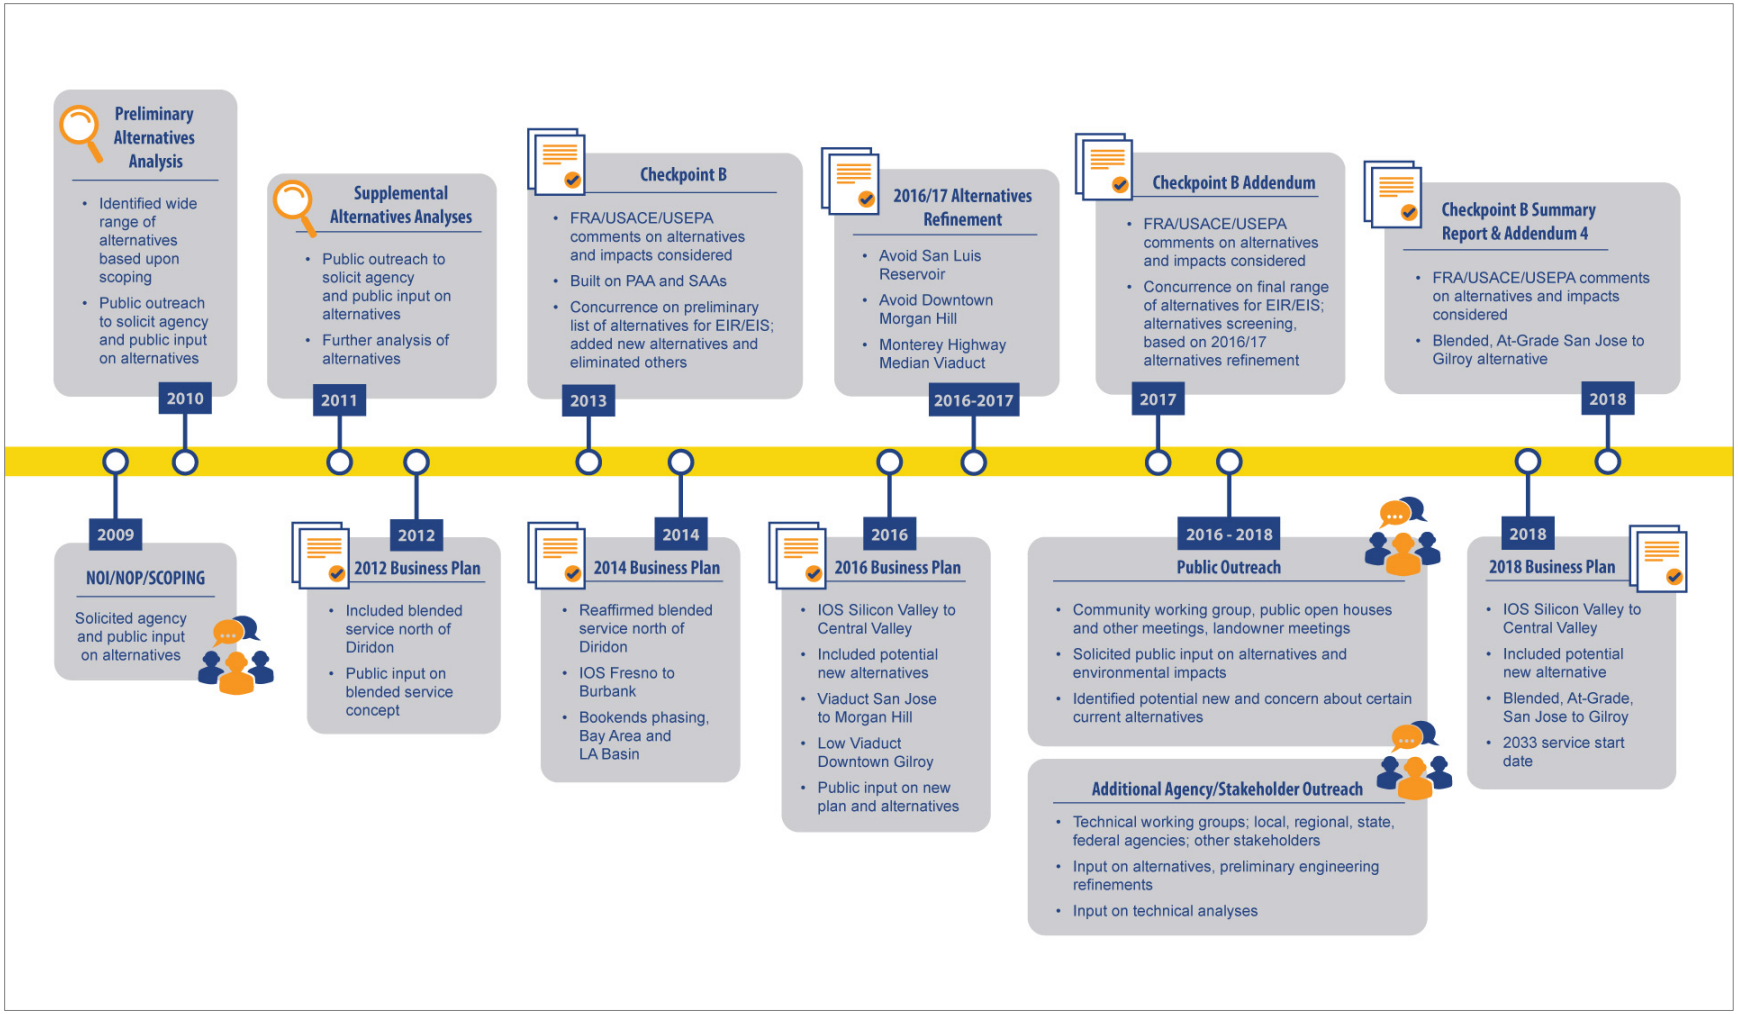
- **Checkpoint A**—The USACE and USEPA review the FRA and Authority's identification of the project's purpose and need, and concur that it is fully described.
- **Checkpoint B**—The USACE and USEPA review the FRA and Authority's identification of alternatives for full evaluation in the EIR/EIS and concur that the range of alternatives is reasonable prior to release of the Draft EIR/EIS.
- **Checkpoint C**—The USACE and USEPA review the FRA and Authority's preferred alternative and provide concurrence that it represents the preliminary Least Environmentally Damaging Practicable Alternative (LEDPA) and may be preliminarily recommended for Section 408 approval.

NEPA/404/408 Integration is a formal process by which the Federal Railroad Administration (FRA), Authority, U.S. Army Corps of Engineers (USACE), and U.S. Environmental Protection Agency (USEPA) coordinate on the identification, preliminary technical evaluation, and validation of detailed evaluation of alternatives in a NEPA document to ascertain that the requirements of Clean Water Act (CWA) Section 404 (concerning waters/wetlands) and Rivers and Harbors Act Section 408 (concerning federally authorized flood control projects) are fully and concurrently considered. The FRA, Authority, USACE, and USEPA signed a memorandum of understanding (MOU) that established a three-step "checkpoint" process to govern interagency coordination for the integration process (see sidebar).

The following summarizes the San Jose to Merced alternatives development and analysis process and results.

HSR Project-Level Alternatives Requirements

An EIR/EIS is required to analyze the potential effects of a range of reasonable alternatives (14 California Code of Regulations [Cal. Code Regs.] 15126.6; 40 Code of Federal Regulations (C.F.R.) Part 1502.14(a)). Under CEQA, the alternatives are to include a No Project Alternative and a range of potentially feasible alternatives that could (1) meet most of the project's basic objectives and (2) avoid or substantially lessen one or more of the project's significant adverse effects (14 Cal Code Regs. § 15126.6(c)). The lead agency must describe its reasons for excluding other potential alternatives when considering alternatives for evaluation in the environmental document. Under the "rule of reason," an EIR is required to study a sufficient range of alternatives in order to permit a reasoned choice (Cal. Code Regs. 14 § 15126.6(f)). CEQA does not require that all possible alternatives be studied.



JANUARY 2019

Figure 1 Project Alternatives Development and Screening Process

Under NEPA, the alternatives analysis is "the heart of the environmental impact statement" (40 C.F.R. Part 1502.14). Under Council on Environmental Quality (CEQ) regulations, an EIS is required to examine "all reasonable alternatives" to the proposed action, as well as the no-action alternative. The CEQ guidance also allows, when the number of potentially reasonable alternatives is very large, the lead agency to examine "a reasonable number of examples, covering the full spectrum of alternatives" (CEQ, Forty Most Asked Questions Concerning CEQ's National Environmental Policy Act Regulations [1981]). Pursuant to Section 10(b) of the FRA's *Procedures for Considering Environmental Impacts*, "It is entirely proper that the number of alternatives being considered should decrease as the environmental consideration process proceeds and as analysis reveals that certain alternatives would in fact be unreasonable" (64 Fed. Reg. 28546, 28550). The Authority and FRA considered the input of the public and interested resource agencies when developing the reasonable range of alternatives. Pursuant to CEQA and NEPA, the Authority and FRA held scoping meetings to invite public participation in defining the scope of the analysis, including the range of reasonable alternatives.

Alternatives Consideration Process and Chronology

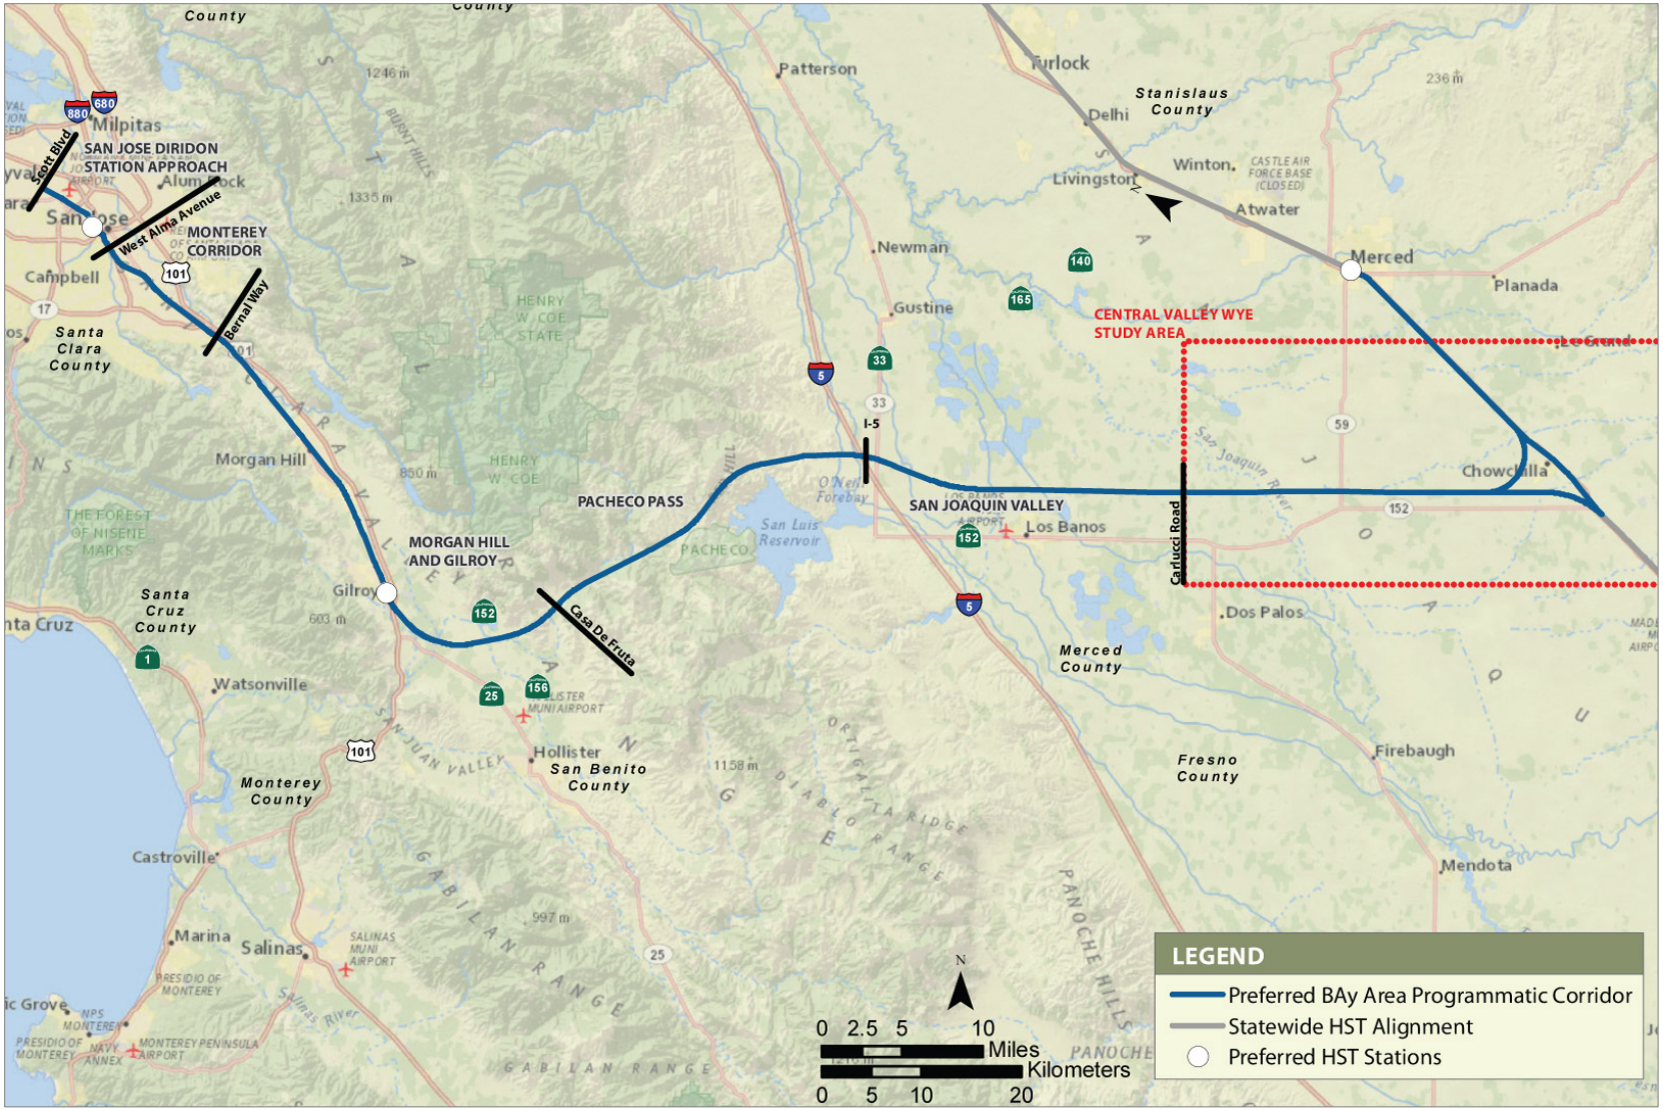
The following summarizes the milestones in alternatives development and consideration during this period.

NEPA/CEQA Scoping (2009)

On February 23, 2009, the Authority distributed an NOP announcing preparation of an EIR for the entire San Jose to Merced Project Section. The FRA published an NOI in the Federal Register on March 16, 2009, announcing the preparation of an EIS for the Project Section. Figure 2 from the Final Scoping Report illustrates the preferred corridor identified in the Statewide Program EIR/EIS (Authority and FRA 2009). The Authority held scoping meetings in Merced (March 18, 2009), San Jose (March 25, 2009), and Gilroy (March 26, 2009). More than 300 residents, property and business owners, agency representatives, elected officials, the media, and other interested parties participated in these meetings. The Authority and FRA solicited input concerning potential project-level alternatives and environmental effects.

Major issues raised during scoping included alignment options and alternatives for routes, stations, and maintenance facilities, design options for grade crossing and separations, considerations for alternative elevated, trenched or tunneled alignments, parking locations, and other facilities. Additional alignment alternatives suggested and shown on Figure 3 included:

- In San Jose, to avoid potential impacts on the greater Gardner neighborhood, several options for an underground tunnel or at-grade and alignment design options along State Route (SR) 87, south of I-280, between the Diridon and Tamien Caltrain stations
- In the south part of San Jose between the Tamien station to Coyote Valley, an option to follow SR 87 and SR 85, replacing the (Santa Clara) Valley Transportation Authority (VTA) light rail that runs along that corridor with high speed rail, and relocating the VTA light trail to Monterey Road.
- South of San Jose, an option to follow U.S. Highway (US) 101 to reach Gilroy, bypassing downtown Morgan Hill
- East of Gilroy on the west side of Pacheco Pass, an option to explore alignment options that would avoid bisecting the Frazier Lake Airpark
- On the east side of Pacheco Pass, options to avoid the Grassland Ecological Area and cross the San Joaquin Valley from Santa Nella to SR 99
- From Los Banos east, several options to follow SR 152 to reduce potential impacts on agricultural lands and Chowchilla
- Options south of SR 152 to reduce potential impacts on Chowchilla and make a connection to the Merced to Bakersfield Project Section



Source: Authority and FRA 2009

FEBRUARY 2018

Figure 2 Tier 1 Decision as Foundation for Range of Alternatives in Tier 2 EIR/EIS

This input helped to shape the initial alternative alignments that were considered for this section of the HSR system.

Preliminary and Supplemental Alternatives Analysis (2010–2011)

The development of initial project-level alternatives in 2009 followed the process described in *Alternatives Analysis Methods for Project EIR/EIS, Version 2* (Authority 2009). Figure 3 illustrates the initial range of alternatives identified through the scoping process. The assessment of potential alternatives involved both qualitative and quantitative analyses to address applicable policy and technical considerations. These methods included field inspections of corridors; project team input and review considering local issues that could affect alignments; qualitative assessment of constructability, accessibility, operations, maintenance, right-of-way, public infrastructure, railway infrastructure, and environmental effects; engineering assessment of project length, travel time, and configuration of key features of the alignment (such as the presence of existing infrastructure); and geographic information system (GIS) analysis of effects on farmland, water resources, wetlands, threatened and endangered species, cultural resources, current urban development, and infrastructure. Stakeholder input, concerns, and preferences were considered to provide local context.

Key Environmental Factors in the PAA and SAA Analysis

The PAA/SAA review considered all of the following factors:

- System factors: journey time, rail length, intermodal connections, costs
- Constructability: feasibility, disruption to existing railroads and utilities
- Endangered and Threatened Species: Effects on habitat for state- and federally listed plant and wildlife species
- Farmland: Effects on designated Important Farmland
- Flood Control: Effects on floodplains
- Cultural resources: Effects on archaeological sites and historic buildings and structures
- Geological constraints
- Land Use: Consistency with local planning
- Noise-sensitive receptors near alignment
- Parks and Open Space: Effects on publicly owned parks, recreational areas, and wildlife areas per Section 4(f) of the 1966 Department of Transportation Act
- Residential/Commercial: Potential displacement of residences and businesses
- Schools in close proximity
- Traffic effects and road closures
- Visual/scenic resources
- Waters/Wetlands: Effects on state and federal waters

Next, the Authority evaluated the narrowed range of alternatives against HSR system performance criteria. Figure 4 illustrates the alignment alternatives that were carried forward into detailed alternatives analysis. The screening process entailed use of environmental criteria to measure the potential effects of the proposed alternatives on the natural and human environment. For example, the land use criteria measured the extent to which a station alternative would support transit use; be consistent with existing adopted local, regional, and state plans; and be supported by existing and future growth areas. Constructability measured the feasibility of construction and the extent to which right-of-way would be constrained. Community effects measured the extent of disruption to neighborhoods and communities, such as the potential to minimize (1) right-of-way acquisitions, (2) the extent of division of an established community, and (3) conflicts with community resources. The analysis of biological resources and water quality evaluated the extent to which an alternative would minimize effects on natural resources. As a result of this screening process, some alignment alternatives were selected to proceed into the Draft EIR/EIS, as illustrated on Figure 5.

The *San Jose to Merced Preliminary Alternatives Analysis Report* (PAA) (Authority and FRA 2010) and the two San Jose to Merced Supplemental Alternatives Analysis reports (SAA) (Authority and FRA 2011a, 2011b) present the alternatives analysis. The PAA and SAAs considered the entire Project Section from the San Jose HSR Station through the Central Valley Wye (the planned junction with the Merced to Fresno Project Section) and north to Merced. The alternatives analyses provide the reader with an understanding of how alternatives were developed, taking into account alignment and station development considerations. While the

alternatives analysis process considered multiple criteria (see sidebar), it emphasized the project objective to maximize the use of existing transportation corridors and available rights-of-way to the extent feasible as determined by the Authority" (California Streets and Highways Code, Division 4, Chapter 20, Section 2704 et seq.). Those alternatives that were not carried forward by the Authority and FRA had greater direct and indirect environmental effects, were impracticable, or failed to meet the project purpose. Figure 6 illustrates the alignment and station alternatives that resulted from this further development and screening process.

The three alternatives analysis reports referenced above (Authority and FRA 2010, 2011a, 2011b) evaluated alignment alternatives. These documents describe the procedure and rationale for selecting and rejecting alignment alternatives.

Public and agency comments were solicited by the Authority during preparation of the alternatives analysis reports. The PAA and SAAs describe the recommended alternatives to be carried forward for further analysis and alternatives to be withdrawn from further consideration.

2012 Business Plan (2012) and SB 1029

The 2012 Business Plan (Authority 2012) introduced the blended system concept for the San Francisco to San Jose Project Section of the HSR system. Under the blended system, Caltrain and HSR would share the Caltrain corridor and tracks in a mostly at-grade system from San Jose to San Francisco. Senate Bill (SB) 1029 made the blended system a legislative mandate. The San Jose to Merced Project Section includes the area north of the San Jose Diridon Station to Scott Boulevard. As further discussed in the description of Alternative 1, Caltrain and HSR would operate in a blended service from north of I-880 to Scott Boulevard.[1]

[1] Alternatives 2 and 3 would transition to at-grade operations at Scott Boulevard and therefore would not include a blended service component.

Checkpoint B Summary Report (2013)

Pursuant to the NEPA/404/408 Integration MOU, the FRA and the Authority are required to get concurrence from the USACE and USEPA regarding the range of alternatives to be analyzed in the Draft EIR/EIS. The integration process makes certain that the evaluation considers potential alternatives that can be feasibly permitted by the USACE under the requirements of CWA Section 404 and Rivers and Harbors Act Section 408.

In 2013, the Authority and FRA developed a *Checkpoint B Summary Report*, largely drawn from the work completed for the PAA and SAAs between June 2010 and July 2011, for review by the USACE and USEPA. The USACE and USEPA concurred in August and September 2014, respectively, with the alternatives recommended for inclusion in the Draft EIR/EIS.

Following the completion of the Checkpoint B analysis in 2013, work on the San Jose to Merced Project Section as a whole was suspended, and the Authority initiated a more limited study focused on the Central Valley Wye. The Central Valley Wye study was advanced as a supplemental EIR/EIS for the Merced to Fresno Project Section. The *Merced to Fresno Section: Central Valley Wye Draft Supplemental EIR/EIS* (Authority 2019) was published May 2, 2019.

Key Environmental Factors in the Checkpoint B Analysis

The Checkpoint B alternatives review considered all the following factors:

- Waters/Wetlands: Effects on waters of the U.S. (including wetlands) per CWA Section 404 as well as state-regulated wetlands and riparian areas
- Flood Control: Effects on federally authorized flood control projects under Rivers and Harbors Act Section 408 and on floodplains
- Cultural Resources: Effects on archaeological sites and historic buildings and structures
- Endangered and Threatened Species: Effects on habitat for state- and federally listed plant and wildlife species
- Environmental Justice: Extent of low-income populations and minority populations near the alignment
- Farmland: Effects on designated Important Farmland
- Parks and Open Space: Effects on publicly owned parks, recreational areas, and wildlife areas per Section 4(f) of the 1966 Department of Transportation Act
- Residential and Commercial: Potential displacement of residences and businesses

In late 2015, the Authority reinitiated work on the San Jose to Central Valley Wye Project Extent – that is, the portion of the San Jose to Merced Project Section that is located to the west of the Central Valley Wye. The additional analysis of the Project Extent began with, and built upon, the range of alternatives that had been documented in the *2014 Checkpoint B Summary Report* for the San Jose to Merced Project Section.

2016 Business Plan (2016)

The 2016 Business Plan (Authority 2016) described the Authority's decision to shift its early focus from the project sections in Southern California to those in Northern California with a goal of initiating Central Valley to Silicon Valley (Valley-to-Valley) service in 2025. In light of updated ridership forecasts and operational planning undertaken since the 2012 Business Plan, the Authority identified certain new alternatives (such as a viaduct alternative between San Jose and Gilroy and blended operation north of Diridon Station) and also reconsidered the formerly dismissed at-grade alignment for the San Jose Diridon Station Approach Subsection as part of the 2016 Business Plan.

Further Outreach, Consultation, and Alternatives Refinement (2016–2017)

After reinitiating work on the San Jose to Central Valley Wye Project Extent in 2015 and after adoption of the Business Plan in 2016, the Authority and FRA conducted additional community outreach and engineering along the corridor. With project reinitiation, the Authority and FRA reached out to the public, stakeholders, and agencies to solicit their input and concerns about project alternatives and to consider refinements of the prior alternatives or the addition of new alternatives responsive to those concerns. The reconsideration of alternatives in 2016 and 2017 used a two-phase screening process to evaluate the direct and relative performance of conceptual alternatives. The initial phase considered financial feasibility, constructability, and operations. If the alternative met these initial criteria, then it was also reviewed for community and environmental impacts (Table 1).

Table 1 Evaluation Criteria, 2016–2017 Alternatives Refinement for San Jose to Central Valley Wye Project Extent

Evaluation Criteria	Considerations
First Phase	
Financial feasibility	▪ Be financially feasible within the Authority's capital expenditure program
Constructability	▪ Provide constructible, 100-year lifecycle infrastructure ▪ Be reasonably constructed within the project schedule timeframe without unacceptable risks
Operations/Maintenance	▪ Support safe, reliable, and resilient operations ▪ Train speed meets the Prop 1A service travel time ▪ Peak hour average representative travel time ▪ Blended operations north of Diridon Station and dedicated operations south of Diridon Station ▪ Station configuration to accommodate passing trains ▪ Adhere to federal and state laws governing transportation projects
Second Phase	
Community impact	▪ Would the alternative result in unacceptable community impacts?
Environmental impact	▪ Would the alternative avoid or minimize impacts on aquatic resources protected under Section 404 of the CWA such that it could be considered the least environmentally damaging practicable alternative (LEDPA)? ▪ Would the alternative avoid or minimize impacts on public recreational facilities, wildlife refuges, and listed historic resources protected under Section 4(f) of the U.S. Department of Transportation Act of 1966? ▪ Would the alternative comply with other federal and state regulations protecting environmental resources including the National Historic Preservation Act, the Civil Rights Act, and federal and state Endangered Species Acts?

Source: Compiled by Authority and ICF 2019

During 2016 and 2017, the Authority refined and modified the range of alternatives to be considered in the Draft EIR/EIS in response to changed community conditions, a more detailed understanding of environmental and community concerns, and cost and constructability issues. This section summarizes the outreach processes used in 2016 and 2017 and the input provided by various parties. The actual consideration and fate of 2016 and 2017 alternatives considered are presented in Section 2.4.3, Range of Potential Design Options Considered and Findings by Subsections.

The Authority and FRA conducted public outreach meetings, consulted with environmental regulatory agencies; consulted with cities and counties; met with federal, state, and private landowners; and met with other stakeholders during this process. The Authority presented the alternatives under consideration for the Draft EIR/EIS in a wide-ranging series of public, agency, and stakeholder meetings and received input regarding concerns about alternatives and suggestions for additional alternatives. This additional outreach led to the development of new design options in the Monterey Corridor, Morgan Hill and Gilroy, and Pacheco Pass Subsections and reconsideration of some alternatives previously dismissed in earlier alternative evaluations. Figure 7 illustrates the alignments and design options that were presented in April 2016 community and technical working group meetings. Table 2 shows the key outreach venues, concerns expressed, and alternatives considered as a result of this outreach. Summaries of individual public and agency meetings are shown in Table 9-1 in Chapter 9, Public and Agency Involvement, of the Final EIR/EIS.

Table 2 Summary of Key Outreach Venues and Alternatives Concerns, 2016–2017

Type	Dates	Concerns Expressed
Open House/Community meetings (Los Banos, Gilroy, Morgan Hill, San Jose, neighborhood groups)	2016: May, June, September, November, December 2017: February, March, April, May, July	▪ San Joaquin Valley: Community expressed concerns about impacts on farmlands, dairies, wildlife, and Henry Miller Road. Requests to reconsider options south and north of Henry Miller Road dismissed in prior PAA/SAA/Checkpoint B processes. ▪ Pacheco Pass: Community expressed concerns about impact on individual properties and the Romero Ranch Conservation Easement. ▪ Gilroy: Citizens expressed concerns about community disruption, aesthetics, right-of-way acquisition, agricultural impacts, and cultural resources for both downtown and east Gilroy options. Alternatives considered include East Gilroy, Downtown Gilroy, and US 101 options. ▪ San Martin: Residents advocated for reconsideration of US 101 alignments to avoid impacts on downtown San Martin. ▪ Morgan Hill: Community expressed concerns about impact of alignments through downtown and bypassing downtown due to displacement. Environmental group concerns about the impact on wildlife movement in the Coyote Valley. ▪ Monterey Corridor: Residents expressed concerns about traffic, noise, and aesthetic impacts on Monterey Corridor. Requests for reconsideration of US 101 alignments and for tunnel option. ▪ Downtown San Jose: Some parties expressed continued interest in tunnel and at-grade options due to concern about aesthetics and business displacements of downtown aerial option. Other parties expressed concern about impact of at-grade options on communities and other rail operators (e.g., Caltrain). ▪ North of downtown San Jose: Community expressed concerns about aesthetic impact of viaduct to Scott Blvd. option and favor shorter viaduct (to I-880).
CWGs (Los Banos, Gilroy-Morgan Hill, San Jose)	2016: April, August 2017: January, May, July, August, September, October	
TWGs (Los Banos–Gilroy, Gilroy, San Jose to Morgan Hill, San Jose)	2016: March, April, June, July, August, September 2017: January, June, July	

Type	Dates	Concerns Expressed
City/County Meetings Gilroy, Morgan Hill, San Jose, Santa Clara County, Merced County	2016: May, June, July, August, September, October, November, December 2017: January, February, March, April, May, June, July, August	▪ Consultation with Gilroy resulted in selection of two vertical options for downtown Gilroy including low viaduct and embankment (eliminating trench and high viaduct options) and consideration of a US 101 alignment within Gilroy. ▪ Consultation with Morgan Hill resulted in creation of a Morgan Hill bypass option to reduce impacts on downtown Morgan Hill. ▪ Consultation with City of San Jose resulted in development of a median viaduct option as well as consideration of a tunnel option for Monterey Corridor. The city also requested a reconsideration of a prior tunnel and at-grade options for downtown San Jose and conducted independent analyses of these options.
Agency meetings Federal: GSA, Reclamation, USFWS, NMFS State: CDFW, CALTRANS, RWQCB Local: SCVWD, VTA, Water Authorities, Reclamation Districts, Irrigation Districts, Caltrain, BART, School Districts. Pajaro River Watershed Flood Prevention Authority	2016: March, June, July, August, October, November, December 2017: January, February, March, April, May, June, July, August	▪ Reclamation concerns regarding encroachment into San Luis Reservoir resulted in a shift of the Pacheco Pass option to the North Pacheco Pass tunnel option to avoid the reservoir. ▪ Resource agencies' registered concerns over impacts on sensitive species and habitat, aquatic resources, and wildlife movement corridors. Detailed analysis, in cooperation with agencies, through the checkpoint process led to design modifications of increase wildlife permeability. ▪ Water infrastructure agency concerns addressed through project design modifications and mitigation. ▪ Soap Lake designs were coordinated with flood districts and resource agencies to address floodplain capacity and wildlife movement concerns with more permeable structures. ▪ Coordination with interagency working group on Diridon Station options to consider City of San Jose, Caltrain, BART, SCVWD, and other agency concerns.

Checkpoint B Summary Report Addendum 3 (2017)

The Authority and FRA reviewed prior design options and new design options developed during 2016 and 2017. The results of the evaluation of new design options and reconsideration of prior design options are presented in Section 2.4.3, Range of Potential Design Options Considered and Findings by Subsection.

The Authority and FRA developed a Checkpoint B Summary Report Addendum 3 to narrow the range of alternatives to three of the end-to-end alternatives evaluated in the Draft EIR/EIS. Figure 8 illustrates the alignments and design options that were recommended to carry forward in the Draft EIR/EIS as a result of the evaluation. The USACE and USEPA concurred with the range of alternatives in the Checkpoint B Summary Report Addendum 3 (Authority and FRA 2017) on October 20, 2017.

2018 Business Plan (2018)

The 2018 Business Plan (Authority 2018) confirmed the Authority's decision to focus on the project sections in Northern California with a goal of initiating Central Valley to Silicon Valley (Valley-to-Valley) service in 2033. In light of operational planning undertaken since the 2016 Business Plan, the Authority reconsidered the formerly dismissed at-grade alignment for the San Jose Diridon Station Approach Subsection and extending blended service proposed for the San Francisco to San Jose Project Section from San Jose to Gilroy as part of the 2018 Business Plan. The blended infrastructure and service between San Jose Diridon Station and Downtown Gilroy Station would occur largely at grade and predominantly within the existing Caltrain and UPRR rights-of-way. The concept of extending blended electrified passenger rail infrastructure and operations from San Jose to Gilroy is currently under discussion between the California State Transportation Agency, the Authority, and UPRR. The parties have advanced the concept sufficiently that the Authority has determined that this alternative merits study as at least potentially feasible at this time. Figure 9 illustrates the phasing plan from the 2018 Business Plan.

Checkpoint B Summary Report Addendum 4 (2018)

The Authority and FRA reviewed a Blended, At-Grade design option developed during 2017 and 2018 that would implement the 2018 Business Plan concept. The blended alternative would represent a least-cost option for initiating early service between San Jose and downtown Gilroy and could reduce certain impacts relative to the other alternatives previously advanced for study.

The Authority and FRA developed a *Checkpoint B Summary Report Addendum 4* to review the preliminary effects of this alternative and assess whether to evaluate a new alternative in the Draft EIR/EIS. The USACE and USEPA concurred with the range of alternatives in the *Checkpoint B Summary Report Addendum 4* (Authority and FRA 2018) on January 22 and February 1, 2019 (respectively).

Range of Potential Design Options Considered and Findings by Subsection

This section discusses the range of potential route design options and corresponding locations of stations and maintenance facilities that were considered by the Authority and FRA during the alternatives development process (the PAA, the two SAAs, the 2013 Checkpoint B Report, the 2017 Checkpoint B Summary Report Addendum 3, and the 2018 Checkpoint B Summary Report Addendum 4). The following analysis discusses design options by subsection. After the Authority and the FRA screened design options for each subsection to determine which would be advanced to EIR/EIS evaluation, the Authority linked the design options to define three end-to-end project alternatives; a fourth alternative was identified to provide blended, at-grade service from San Jose to Gilroy.

The new design options developed during 2016 and 2017 and some of the prior design options previously reviewed were reviewed by the Authority and FRA using the five-step process previously described. The results of the evaluation of new design options and reconsideration of prior design options are presented in Section 2.4.3, Range of Potential Design Options Considered and Findings by Subsection.

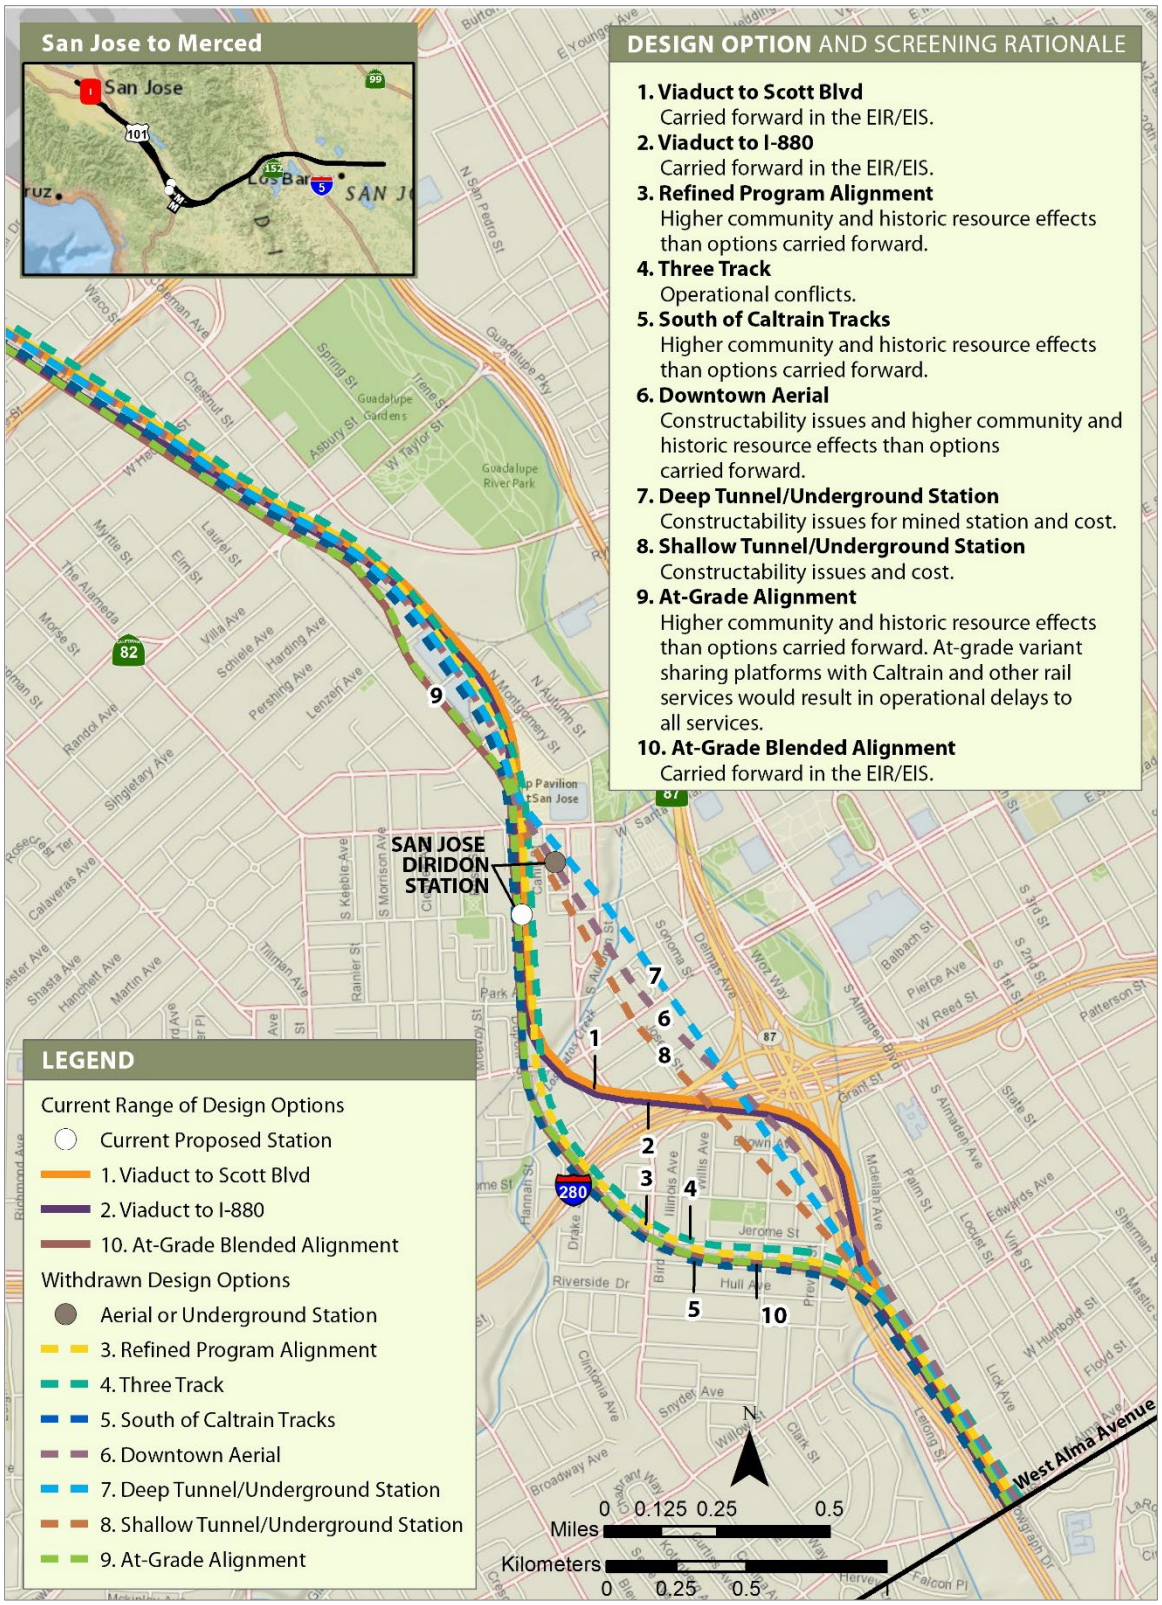
San Jose Diridon Approach Subsection Design Options Considered

The Authority and FRA considered a range of horizontal and vertical alignments to connect the HSR system to downtown San Jose for the San Jose Diridon Approach Subsection, as illustrated on Figure 10.

Note: Implementation phasing is described in Appendix 2-L
Source: Authority 2018

JANUARY 2019

Figure 9 Phasing Plan from the 2018 Business Plan



Source: Authority and FRA 2013, Authority 2016

MARCH 2019

Figure 10 Design Options Considered in the San Jose Diridon Approach Subsection

Two broad themes characterize design options in this subsection: (1) whether HSR will remain within the Caltrain Corridor and (2) whether the HSR vertical profile will be at grade, aerial, or tunnel. Several design options generally follow the Caltrain Corridor alignment: Refined Program Alignment (RPA), Three Track, South of Caltrain Tracks, and At-Grade Alignment options, but they also include areas outside (and parallel to) Caltrain. The Blended, At-Grade option is entirely within the Caltrain and UPRR right-of-way. Other design options do not follow the Caltrain Corridor south of Diridon Station (such as the SR 87/I-280 aerial, Downtown Aerial, and Downtown Tunnel options). The second theme is vertical profile. Many of the design options along the Caltrain Corridor use extensive at-grade profile rather than aerial and tunnel options. Three design options considered by the Authority and FRA (Viaduct to Scott Boulevard, Viaduct to I-880, and Downtown Aerial) entail aerial structures through downtown. The Blended, At-Grade option is entirely at grade through downtown. The Authority and FRA considered and evaluated several tunnel design options.

The Authority and FRA evaluated design options for this subsection in the PAA, SAAs, the 2013 Checkpoint B Summary Report, the 2017 Checkpoint B Summary Report Addendum 3, and the 2018 Checkpoint B Summary Report Addendum 4. Additional modified tunnel options were evaluated leading into the Checkpoint B Summary Report Addendum 3 process per community interest. An additional Blended, At-Grade option was evaluated in the 2018 Checkpoint B Summary Report Addendum 4.

In the 2013 Checkpoint B Summary Report, all the design options, except the SR 87/I-280 aerial option, were withdrawn from further consideration by the Authority and FRA due to a variety of practicability, feasibility, and environmental effect reasons. Table 3 shows the rationale, and greater detail is provided in the PAA, SAAs, 2013 Checkpoint B Summary Report, 2017 Checkpoint B Summary Report Addendum 3, and 2018 Checkpoint B Summary Report Addendum 4. The downtown tunnel options considered in the Checkpoint B process (Deep Tunnel and Shallow Tunnel) were withdrawn due to constructability constraints of a mined underground station and the substantially higher cost than an aerial option.

Three modified tunnel options considered subsequent to the Checkpoint B process were withdrawn, primarily for constructability constraints. The “Thread the Needle” tunnel option would have increased travel time compared to the Deep Tunnel and would face constructability issues because of limited portal space in the SR 87/I-280 interchange. The “5100m Tunnel” option would face constructability issues associated with building a station beneath active rail lines and stations, as well as increased travel time compared to the Deep Tunnel. The “Modified Tunnel” option—a medium-depth tunnel—was withdrawn due to constructability issues associated with a mined station, concerns about interaction with the future Bay Area Rapid Transit (BART) station, and constraints on future development.

An at-grade, dedicated alignment and HSR operations for the San Jose Diridon Approach Subsection were reconsidered after the Authority Board of Directors adopted the 2016 Business Plan. Staff evaluated combined use of the existing Diridon Station platforms and tracks for stopping and through-station operations with other passenger railroads. Staff determined that combined use would result in substantial delays to all passenger rail services (and conflict with freight rail operations) because of insufficient capacity at Diridon Station and approaching track. Resolving capacity constraints would require relocation of the Caltrain Centralized Equipment Maintenance and Operations Facility (CEMOF) to allow the combination of dedicated HSR and continued and planned passenger rail services (Authority 2016). The Authority and FRA also reaffirmed that an at-grade, dedicated alignment would have substantial community effects on the North Gardner neighborhood, as originally identified in the PAA, SAAs, and 2013 Checkpoint B Summary Report.

in 2016 and 2017, public input continued to advocate for consideration of HSR within the existing railroad rights-of-way to minimize impacts on existing communities and planned development along the alignment between San Jose and Gilroy. During this period, the concept of extending blended electrified passenger rail infrastructure and operations from San Jose to Gilroy was discussed by the California State Transportation Agency, the Authority, and UPRR. The parties

had advanced the concept sufficiently that the Authority determined that the approach was potentially feasible and merited further evaluation. A blended, at-grade alternative was added after the Authority Board of Directors adopted the 2018 Business Plan. The new alternative was evaluated in the Checkpoint B Summary Report Addendum 4 after development and consideration in 2017 and 2018.

Variations of the at-grade alignment, with exclusive HSR platforms east or west of the existing Diridon Station and platforms, were evaluated by the Authority in response to public concerns raised in 2016 and 2017 about the aesthetic and land displacement effects of an aerial design option on downtown San Jose. An HSR station east of the existing station tracks would require moving the existing historic Diridon station, using extensive portions of City parking lots around the SAP Center for tracks, and necessitating other displacements in downtown, in addition to the aforementioned community effects on the North Gardner neighborhood. An HSR station west of the existing station tracks would eliminate access to CEMOF, require relocation of the VTA light rail station, necessitate the demolition of multistory residential units west of the existing station, and lead to the aforementioned impacts on the North Gardner neighborhood. In consideration of these factors, the Authority and FRA dismissed all permutations of an at-grade design option for this subsection, confirming the prior 2013 Checkpoint B Summary Report determination.

In 2016 and 2017, local community residents expressed concern about visual and noise effects of an aerial section north of I-880 next to the College Park neighborhood. In response to these comments, the Authority developed a variant of the aerial design option that would entail an at-grade profile near I-880 instead of continuing on aerial structure all the way to Scott Boulevard. In response to the Authority's 2018 Business Plan and input received from the public about developing an at-grade station at San Jose Diridon and staying within the existing railroad right-of way, the Authority developed and considered a Blended, At-Grade option that would use a blended alignment from the San Jose Diridon Station to Downtown Gilroy Station. This option was subsequently evaluated in the Checkpoint B Summary Report Addendum 4.

Table 3 shows the design options considered for this subsection and the rationale for inclusion or withdrawal from further consideration in this Final EIR/EIS. With elimination of the other design options, three design options for the San Jose Diridon Approach Subsection are evaluated in this Final EIR/EIS: Viaduct to Scott Boulevard, Viaduct to I-880 as demonstrated here, and Blended, At-Grade as a result of the 2018 Business Plan. These design options are described in greater detail in Section 2.5.

Monterey Corridor Subsection Design Options Considered

The Authority and FRA considered a range of horizontal and vertical alignments for the Monterey Corridor Subsection (Figure 11). The themes defining the design options considered in this subsection are choice of transportation corridor (i.e., UPRR, Monterey Road, US 101, or SR 87/SR 85) and vertical profile (i.e., at grade, aerial, or tunnel).

The Bay Area to Central Valley Program EIR/EIS originally considered shared use of the UPRR corridor (as distinct from the UPRR right-of-way) for an at-grade alignment between San Jose and Gilroy. When UPRR subsequently decided not to provide HSR with use of the UPRR corridor, the Authority and FRA withdrew shared use and longitudinal encroachments within the UPRR right-of-way as design options. The Tier 1 EIR/EIS proposed an HSR at-grade alignment adjacent to the UPRR right-of-way, using surplus right-of-way resulting from the reduction of lanes on Monterey Road as proposed in the San Jose general plan. Subsequently, an addendum to Checkpoint B proposed the addition of a fourth alternative (Alternative 4) to the San Jose to Central Valley Wye project, augmenting the three alternatives that were defined in the 2017 Checkpoint B Summary Report Addendum 3. Alternative 4 would implement blended electrified passenger rail infrastructure and operations between San Jose and Gilroy. Under Alternative 4, blended infrastructure and service would extend past the current endpoint for blended operations at San Jose Diridon Station to the Downtown Gilroy Station. This service would occur largely at grade and within the existing Caltrain and UPRR rights-of-way, as described in the 2018 Business Plan (Authority 2018).

The concept of extending blended electrified passenger rail infrastructure and operations from San Jose to Gilroy is currently under discussion between the California State Transportation Agency, the Authority, and UPRR. The parties have advanced the concept sufficiently that the Authority has determined that this alternative merits study as at least potentially feasible at this time and would reduce certain impacts relative to the other alternatives previously advanced for study.

The Bay Area to Central Valley Program EIR/EIS identified the Monterey Road corridor as the preferred program route on the basis of feasibility and community effect issues associated with the US 101 and SR 87/SR 85 corridors. The SR 87/SR 85 design option was further reviewed prior to completion of the PAA and was withdrawn because of cost and logistical impracticability, including the need to relocate the VTA's light rail line from SR 87 to the Monterey Road corridor, overhead clearance issues, and community effects. The Authority and FRA considered three US 101 design options: US 101/I-280, US101 to Monterey Road via SR 85, and US 101 to Monterey Road via Blossom Hill Road, in response to public outreach comments in 2016 and 2017. The Authority determined that the freeway and roadways curves are too sharp to accommodate HSR design requirements (nominally 125–130 mph) for this subsection. Where the HSR alignment would depart from the roadway right-of-way, comparatively more residential and commercial displacements would be required than those associated with the Monterey Road design options carried forward. A US 101 alignment from South San Jose to Gilroy would also result in substantially greater effects on Section 4(f) public recreational resources and sensitive biological resources compared to the Monterey Road design options carried forward.

Analogous to consideration of horizontal alignment options within the vicinity of the Tier 1 corridor, the Authority and FRA have evaluated vertical at-grade, aerial, trench, and tunnel profile design options as part of the Tier 2 project analysis. An at-grade alignment along Monterey Road (previously referred to as the RPA) was the initial proposal. During design development, the cost and feasibility of providing an at-grade alignment within the UPRR corridor was considered. A viaduct option (the 2016 Business Plan based the program capital cost estimate on a viaduct alongside Monterey Road) was introduced to address the preference for use of existing transportation corridors, while also acknowledging that a viaduct could offer enhanced separation from UPRR and to consider cost differential. When the aerial viaduct alongside Monterey Road was explored, it became clear that the ground impacts and visual intrusion of running the line along one side of Monterey Road would present substantial effects that could be addressed by moving the aerial viaduct into the median of Monterey Road. The original viaduct alignment adjacent to the UPRR right-of-way on the west side of Monterey Road was shifted to the roadway median after consultation with City of San Jose staff to allow more room for the roadway. The At-Grade (RPA) and the Median Viaduct along Monterey Road were both determined to be practicable and are included as part of the alternatives evaluated in detail in this Final EIR/EIS.

Table 3 San Jose Diridon Station Approach Subsection: Design Options Considered

Design Option	Description	Determination	Rationale
Design options to be evaluated in detail in the Final EIR/EIS			
Viaduct to Scott Blvd.	Viaduct from south of Tamien Station to SR 87/I-280, Diridon Station arrival and departure, and then north to Scott Blvd	To be evaluated in detail in EIR/EIS	This option is potentially practicable and is carried forward for further analysis because it meets the project's purpose and need; minimizes effects by staying predominantly within existing transportation corridor rights-of-way; and does not have the logistical, feasibility, and cost issues associated with the alignment options being withdrawn.
Viaduct to I-880	Viaduct from south of Tamien Station to SR 87/I-280, Diridon Station arrival and departure, and then north to I-880 and at-grade to Scott Blvd	To be evaluated in detail in EIR/EIS	This option is potentially practicable and is carried forward for further analysis because it meets the project's purpose and need; minimizes effects by staying predominantly within existing transportation corridor rights-of-way; and does not have the logistical, feasibility, and cost issues associated with the alignment options being withdrawn. This option would entail a shorter viaduct than the Viaduct to Scott Blvd option, which would reduce visual effects but would require other changes in construction.
Blended, At-Grade	Blended, at-grade from south of Tamien Station to Scott Blvd	To be evaluated in detail in EIR/EIS	This option is potentially practicable and is carried forward for further analysis because it meets the project's purpose and need; minimizes effects by staying predominantly within existing railroad rights-of-way; and does not have the logistical, feasibility, and cost issues associated with the alignment options being withdrawn. This option would entail blended at-grade operation, which would be a least-cost option.
Design options withdrawn from further consideration			
Refined Program Alignment (RPA)	Aerial structure from Diridon Station to south of West Virginia St, then at-grade alignment along Caltrain Corridor with two additional tracks for HSR, then to an elevated structure crossing SR 87, continuing south within the SR 87 and Caltrain ROW	Withdrawn in the PAA and the 2013 Checkpoint B document.	Withdrawn from further analysis because of greater effects on historic properties than the design options being carried forward, and could also affect additional residential properties. In addition, comparatively greater significant community effects could result from substantial noise, visual, vibration, traffic congestion and circulation, property value, and construction disruption impacts.

Design Option	Description	Determination	Rationale
Three Track	Same as the RPA option with the exception that Caltrain and UPRR would share one track through the Greater Gardner neighborhood south of Diridon Station	Withdrawn in the PAA and the 2013 Checkpoint B document	Withdrawn from further analysis because it would be impracticable due to operational conflicts with existing rail and transit and would not meet the project's purpose and need.
South of Caltrain Tracks	Same as the RPA except the HSR tracks would be south of the existing Caltrain/UPRR tracks through the Greater Gardner neighborhood	Withdrawn in the PAA and the 2013 Checkpoint B document	Withdrawn from further analysis because of substantial effects on aesthetic/visual resources, residential displacements, and more severe effects on historic properties than the options being carried forward.
Downtown Aerial	Aerial through downtown San Jose bypassing Diridon Station	Withdrawn in the PAA and the 2013 Checkpoint B document	Withdrawn from further analysis because it was found to be impracticable due to major constructability issues, the comparatively high number of residential displacements, potential inconsistency with existing plans and policies, aesthetic/visual effects, and more severe effects on historic properties than the options being carried forward.
Deep Tunnel/ Underground Station	Tunnel through downtown San Jose and underground San Jose HSR station	Withdrawn in the PAA and the 2013 Checkpoint B document	Withdrawn from further analysis because it was found to be impracticable as a result of geologic conditions (constructability and operational challenges of a mined underground station in an area of high groundwater); this design option would also have a capital cost approximately four times that of the option being carried forward.
Shallow Tunnel/ Underground Station	Tunnel through downtown	Withdrawn in the PAA and the 2013 Checkpoint B document	Withdrawn from further analysis because it was determined to be impracticable due to constructability logistics and a capital cost nearly three times that of the alignment option being carried forward; further, the shallow tunnel design could result in additional cost effects and disruption to both existing and future heavy and commuter rail service caused by possible settlement from tunnel construction where tunnels would cross under those facilities. This design option would result in substantial biological effects resulting from cut-and-cover activities under Los Gatos Creek.
At-Grade Alignment	Follows Caltrain corridor with additional dedicated tracks for HSR with three station variants: shared platforms with Caltrain and other services, HSR station west of Diridon platforms, HSR station east of Diridon platforms	Evaluated in 2017 and withdrawn	Withdrawn from further analysis due to substantial community disruption to neighborhoods south of downtown from at-grade alignment through North Gardner neighborhood. Sharing of platform option with Caltrain and other rail services would create substantial operational delays to all services. An HSR station east of the existing station tracks would require moving the existing historic Diridon Station structure, using extensive portions of City parking lots around the SAP Center for tracks, and require other displacements in downtown. An HSR station west of the existing station tracks would eliminate access to Caltrain's CEMOF, require relocation of the VTA station, and require the demolition of multistory residential units west of the existing rail station.

MARCH 2019

Figure 11 Design Options Considered in the Monterey Corridor Subsection

The Authority also considered a trench option, but eliminated it from further consideration due to substantially higher construction costs than the at-grade or aerial options. Pursuant to comments from outreach in 2016 and 2017 concerning the effects of the at-grade alignment and the median viaduct on Monterey Road, the Authority evaluated two tunnel design options along Monterey Road: a cut-and-cover tunnel and a bored tunnel. Both tunnel options would extend from the Communications Hill area to south of Bailey Road (approximately 10 miles), because there is not adequate space area along Monterey Road in San Jose to accommodate a short tunnel portal. The Authority dismissed these tunnel designs from further consideration because of prohibitive cost compared to other design options, as well as concern about the effects of lengthy tunnels in an area constrained by the hydraulics of shallow groundwater. The cut-and-cover tunnel would be approximately 2 times and the bored tunnel approximately 2.5 times more costly than the median viaduct.

The Authority previously considered a variation on the at-grade option—East of Caltrain/UPRR—located in the Caltrain right-of-way from Tamien to Curtner Avenue then transitioning to east of UPRR by CP Lick and to a similar alignment as the At-Grade option (RPA). This option was withdrawn from further consideration due to conflicts with Caltrain and UPRR operations and effects on the Tamien Station and a SR 87 northbound on-ramp. The Blended, At-Grade option was identified in response to the Authority's 2018 Business Plan and input received from the public about staying within the existing railroad right-of-way. The option provides an alternative that would travel within the UPRR railroad right-of-way from San Jose Diridon Station to downtown Gilroy.

Table 4 shows the design options considered for this subsection and the rationale for inclusion or withdrawal from further consideration in this Final EIR/EIS. Three designs for the Monterey Corridor Subsection are included in the alternatives being considered in this Final EIR/EIS: (1) Median Viaduct, (2) At-Grade within the Caltrain corridor, and (3) Blended, At-Grade sharing the Caltrain/UPRR right-of-way. These design options are described in greater detail in Section 2.5.

Table 4 Monterey Corridor Subsection: Design Options Considered

Design Option	Description	Determination	Rationale
Design options to be evaluated in detail in the Final EIR/EIS			
1. Median Viaduct	Viaduct along median of Monterey Rd	To be evaluated in detail in EIR/EIS	This option was added because it reduces environmental and community effects relative to the East of UPRR option in this subsection (also known as the At-Grade option); also reduces interaction with UPRR facilities, which reduces the need for intrusion barriers; reduces effects on Swainson's hawk and tricolored blackbird habitat and on grazing land. The reduced footprint of the viaduct also displaces fewer residential units, both in number and square footage, than the At-Grade option.
2. At Grade (RPA)	East of UPRR on west side of Monterey Rd (outside UPRR ROW)	To be evaluated in detail in EIR/EIS	The option is potentially practicable and is carried forward for further analysis because it meets the project's purpose and need; while there are engineering challenges, it would allow for more efficient operation than would the East of Caltrain/UPRR option.
3. Blended, At-Grade	Within the UPRR ROW	To be evaluated in detail in EIR/EIS	This option was added because it reduces the disturbance area and thereby environmental and community effects relative to the other options in this subsection by remaining predominantly within the Caltrain/UPRR railroad right-of-way.
Design options withdrawn from further consideration			
4. SR 87/SR 85	Follows SR 87 and SR 85 from downtown San Jose to south San Jose; relocates VTA light rail along Monterey Rd and South First St	Withdrawn prior to the 2011 PAA	Determined impracticable due to cost and logistics; it would not meet HSR criteria for curve radii; would require construction of an aerial alignment over the freeways, through a residential neighborhood, and across from a high school; and would require relocation of VTA's operating LRT line. The clearance beneath existing overpasses along SR 87 and SR 85 is too low to meet HSR design standards. Relocation of the VTA's LRT would require unidentified funding and study, as it would eliminate light rail service from an existing 10-mile corridor and replace it along a new corridor at considerable cost and impact. This option would also cause more rail and displacement effects than the options carried forward.
5. US 101/I-280	Follows US 101 and I-280 from downtown San Jose to south San Jose	Considered due to public interest; withdrawn in 2017	Determined impracticable due to cost and logistics; it would not meet HSR criteria for curve radii for design speeds. Because the curves required for HSR would have to be located outside the road right-of-way, this option would result in more commercial and residential displacements along the route, compared to options carried forward.
6. US 101 to Monterey Rd via SR 85	Uses SR 85 to connect from Monterey Rd to a US 101 alignment south	Considered due to public interest; withdrawn in 2017	The SR 85 highway corridor curve between US 101 and Monterey Rd is too sharp for proposed HSR design speeds; constructing a 125–130 mph curve would require substantially more displacement of residential/commercial and open space than options carried forward.
7. US 101 to Monterey Rd via Blossom Hill Rd	Uses Blossom Hill Rd to connect from Monterey Rd to a US 101 alignment south	Considered due to public interest; withdrawn in 2017	The Blossom Hill corridor curve between US 101 and Monterey Rd is too sharp for proposed HSR design speeds; constructing a 125–130 mph curve would require substantially more displacement of residential/commercial and open space than options carried forward.

Design Option	Description	Determination	Rationale
8. Cut and Cover Tunnel on Monterey Rd	Cut and cover tunnel on Monterey Rd from Communication Hill to south of Bailey Rd (~10 miles)	Considered due to public interest; withdrawn in 2017	Withdrawn due to prohibitive cost of $2.7 billion, which far exceeds costs for At-Grade or Viaduct options (Viaduct cost for 10 miles is approx. $1.3 billion assuming comprehensive unit cost of $125 million/mile). Tunnel could have substantial effects on groundwater hydrology and supply due to shallow water table. Construction would require closing half of Monterey Rd, resulting in disruption of the transportation corridor.
9. Bored Tunnel on Monterey Rd	Bored tunnel from Communications Hill to south of Bailey Rd (~10 miles).	Considered due to public interest; withdrawn in 2017	Withdrawn due to prohibitive cost of $3.2 billion, which far exceeds costs for At-Grade or Viaduct options (Viaduct cost for 10 miles is approx. $1.3 billion assuming comprehensive unit cost of $125 million/mile). Tunnel could have substantial effects on groundwater hydrology and supply due to shallow water table.
10. East of Caltrain/ UPRR	Within Caltrain ROW from Tamien Station to Curtner Ave, then transitioning to east of UPRR on west side of Monterey Rd (outside UPRR ROW)	Withdrawn in the PAA and 2013 Checkpoint B	Withdrawn from further analysis due to constructability and implementation issues. This option would disrupt Caltrain and UPRR operations and affect the Caltrain Tamien Station and the SR 87 northbound on-ramp.

Morgan Hill and Gilroy Subsection Design Options Considered

In the Morgan Hill and Gilroy Subsection, the Authority and FRA considered a range of horizontal and vertical alignments, as illustrated on Figure 12 through Figure 14.

The defining themes of design options in this subsection are transportation corridor selection (i.e., Monterey Road, US 101, UPRR, or neither); Gilroy station location; vertical profile (i.e., at grade, embankment, aerial, trench, and tunnel); and horizontal alignment. Various maintenance facility locations were also considered.

In the Statewide Program EIR/EIS, the Authority considered several alignments outside existing transportation corridors. The Foothills alignment along the base of the Diablo Range foothills on the east side of Santa Clara Valley included a station east of Morgan Hill. The East of 101 alignment crossed open space, farmland, and rural residential land east of US 101. The Authority withdrew both options from further consideration because they did not follow existing transportation corridors and would have poor station connectivity and accessibility. The Foothills alignment would also have had substantially greater effects on sensitive biological resources than design options carried forward. As discussed below, several options using alignments partially east of US 101 were considered during the project-level alternatives analysis.

The Bay Area to Central Valley Program EIR/EIS (and the Revised Program EIR/EIS and Partially Revised EIR/EIS) focused on the Monterey Road corridor. The Authority subsequently developed additional alignments along the Monterey Road and US 101 corridors for further evaluation, evaluating a total of seven alignment options and four maintenance facility options in the PAA, SAAs, and 2013 Checkpoint B report. All the initial alignment options (except the Gilroy Station Loop) and the four maintenance facility options were originally recommended for inclusion in the Draft EIR/EIS.

The Gilroy Station Loop, which included a mainline track through east Gilroy and a spur track to a two-track Downtown Gilroy Station, was withdrawn from further consideration due to the combined cost and effects, particularly aesthetic and visual quality effects, of building both an east Gilroy and a downtown Gilroy alignment.

The 2016 Business Plan also introduced a viaduct to downtown Gilroy, and the Authority conducted further outreach, agency consultation, and evaluations of potential design options in 2016 and 2017. Based on this input, the Authority identified new designs for consideration and reconsidered the inclusion of prior alignment and maintenance facility options in the Draft EIR/EIS. The 2018 Business Plan introduced a Blended, At-Grade option with an associated maintenance facility location that was subsequently evaluated in the 2018 Checkpoint B Summary Report Addendum 4. Table 5 shows the evaluation process.

Four design options were carried forward for evaluation in this Final EIR/EIS. Two new designs (Viaduct to Downtown Gilroy via Morgan Hill Bypass and Viaduct to East Gilroy via Morgan Hill Bypass) were determined to be practicable and to have fewer effects on Section 4(f) public recreational and sensitive biological resources than other design options. The Embankment to Downtown Gilroy option (formerly the East of UPRR to Downtown Gilroy option) considered in the PAA, SAAs, 2013 Checkpoint B Summary Report, and 2017 Checkpoint B Summary Report Addendum 3 was also determined to be practicable and to result in performance and effects contrasting with those of the two viaduct design options as a consequence of a different route through Morgan Hill and a different vertical profile through Gilroy. The Blended, At-Grade option was determined to be practicable and to minimize disruption and noise impacts on existing local communities, benefit rail operations, and avoid the visual and spatial disruption associated with constructing a dedicated guideway on embankment or viaduct, as determined in the 2018 Checkpoint B Summary Report Addendum 4.

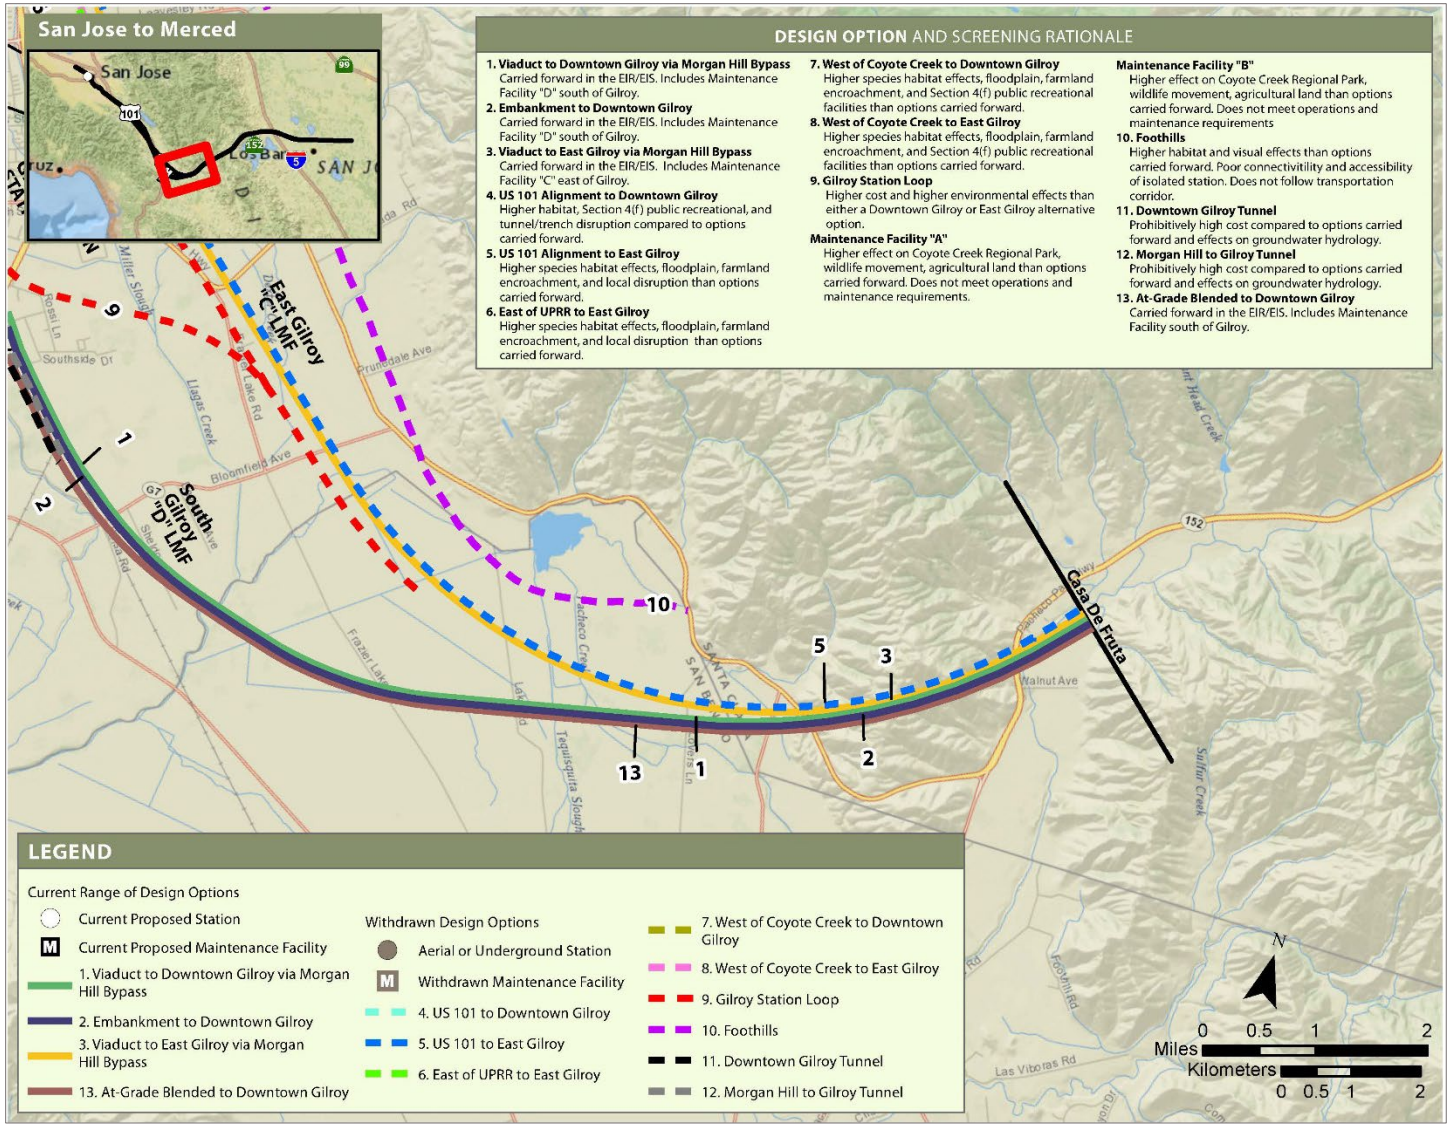
Figure 13 Design Options Considered in the Morgan Hill and Gilroy Subsection



Source: Authority and FRA 2013, Authority 2016

MARCH 2019

Figure 14 Design Options Considered in the Morgan Hill and Gilroy Subsection

The Authority determined the US 101 design options (i.e., US 101 Alignment to Downtown Gilroy, US 101 Alignment to East Gilroy) and the West of Coyote design options (i.e., West of Coyote Creek to Downtown Gilroy, West of Coyote Creek Parkway to East Gilroy), although avoiding the Coyote Creek Parkway, would result in substantially greater effects on Section 4(f) recreational resources, aquatic resources, special-status species habitat, and Important Farmland than other design options carried forward. All except the US 101 to East Gilroy design would also disturb a larger area of floodplains than design options carried forward. The trench and tunnel portions of the alignments near the San Martin Airport would result in greater disruption during construction and increased cost.

The Authority determined that the East of UPRR to East Gilroy design option would have greater effects on special-status species habitat, built historic resources, floodplains, Important Farmland, and residences than design options carried forward. The crossover from east of the UPRR right-of-way to east of US 101 north of Gilroy would also disrupt local infrastructure and land uses to a greater degree than design options carried forward.

Three vertical profile options were considered for the downtown Gilroy alignment: a trench, a high viaduct, and a low viaduct. The trench option would require changing the grade of the existing UPRR tracks and trenching the new grade for the HSR tracks, entailing extensive grade-separation work throughout downtown Gilroy. A high viaduct (nominally 60 feet above ground level) would result in greater visual effects in downtown than the low viaduct option (nominally 30–40 feet high) specified in the Viaduct to Downtown Gilroy option. Because of the greater disruption and visual effects than the options being carried forward, the trench and high viaduct options were withdrawn from further consideration.

Two additional tunnel design options were considered pursuant to outreach conducted in Gilroy and Morgan Hill during 2016 and 2017. A Downtown Gilroy Tunnel design was considered to avoid some of the community effects of the downtown embankment and low viaduct options. Using the tunnel cost estimates developed for the Monterey Corridor Subsection, a 4-mile tunnel was estimated to cost $1.1–1.3 billion compared to a rough cost of $500 million for viaduct of a similar length (excluding the cost of a Gilroy station).[2] A Morgan Hill to Gilroy Tunnel design was considered to avoid effects of an embankment or viaduct design through Morgan Hill, San Martin, and Gilroy. Using the same general unit cost factors, a 15-mile tunnel was estimated to cost $4.0–4.7 billion compared to an estimated cost of $2.0 billion for a viaduct of similar length (excluding the cost of a Gilroy station). Because the substantially higher costs associated with these options, the Authority withdrew them from further consideration.

In 2017, the City of Gilroy requested the Authority consider an alignment along US 101 through Gilroy. The Authority evaluated three Gilroy US 101 Alignment variants along US 101, all of which would transition from Monterey Road north of Buena Vista Avenue to US 101 and then split into either an east of US 101, US 101 median, or west of US 101 alignment. South of downtown Gilroy, the alignments would cross over US 101 and then cross the Soap Lake floodplain to Tunnel 1. The Authority evaluated these alignment variants against the downtown and east Gilroy alignment options using the following criteria: intermodal connectivity, pedestrian and vehicular accessibility, TOD implementation, economic benefit, construction impacts, and parking requirements (Richard 2017).[3] Relative to the downtown alignments, the US 101 alignment and its variants were ranked lower for intermodal connectivity, pedestrian activity, TOD implementation, economic benefit, construction impacts, and parking requirements. Vehicular accessibility was similar. Accordingly, the Authority concluded that a US 101 alignment through Gilroy did not provide any substantial benefit over the downtown alignments included for evaluation in the Final EIR/EIS and thus did not warrant further consideration.

The Authority initially developed and evaluated four maintenance facility options in the PAA, SAAs, and 2013 Checkpoint B report. The maintenance requirements of HSR operations and

[2] The cost estimates for the Monterey Corridor Subsection were developed for cut-and-cover and bored tunnel sections.

[3] The criteria used in evaluating the Gilroy US 101 Alignment variants were refined from the initial list of screening criteria reflecting specific concerns in this corridor.

blended service envisioned in the 2016 Business Plan included the need for equipment and infrastructure maintenance facilities located near Gilroy. The Authority also determined that Maintenance Facility Option “A” (Coyote Creek) and Maintenance Facility “B” (Coyote Creek) would have greater effects on Coyote Creek Regional Park, Important Farmland, and wildlife movement in Coyote Valley than the design options carried forward. Due to operational requirements and greater environmental effects, these design options were withdrawn from further consideration. Maintenance Facility Option “C” (east Gilroy) and Maintenance Facility Option “D” (south of Gilroy) were determined practicable and compatible with the alignments carried forward into the Final EIR/EIS and were accordingly identified to carry forward into the Final EIR/EIS as the East Gilroy LMF/MOIF and South Gilroy LMF/MOIF, respectively. Subsequently, the 2018 Business Plan identified Brisbane as the LMF for San Francisco to San Jose Project Section and changing the East Gilroy and South Gilroy facilities to an MOWF. In addition, the consideration and evaluation of a Blended, At-Grade design between San Jose Diridon Station and Downtown Gilroy Station identified a second south of Gilroy MOWF site. The East Gilroy MOWF, South Gilroy MOWF, and South Gilroy MOWF for Alternative 4 were thus carried forward into the Final EIR/EIS.

Table 5 shows the design options considered for this subsection and the rationale for inclusion or withdrawal from further consideration in this Final EIR/EIS. With elimination of the other design options, four designs for the Morgan Hill and Gilroy Subsection were included in the alternatives being considered in this Final EIR/EIS: (1) Viaduct to Downtown Gilroy via Morgan Hill Bypass (including the South Gilroy MOWF); (2) Embankment to Downtown Gilroy (including the South Gilroy MOWF); (3) Viaduct to East Gilroy via Morgan Hill Bypass (including the East Gilroy MOWF); and (4) Blended, At-Grade to Downtown Gilroy (including the South Gilroy MOWF. These design options are described in greater detail in Section 2.5).

Table 5 Morgan Hill and Gilroy Subsection: Design Options Considered

Design Option	Description	Determination	Rationale
Design options to be evaluated in detail in the Final EIR/EIS			
1. Viaduct to Downtown Gilroy via Morgan Hill Bypass	Viaduct along Monterey Rd median from San Jose, then crossing Coyote Valley east to west side of US 101 around Morgan Hill, then west to Monterey Rd through San Martin, then low viaduct through downtown Gilroy. Includes Maintenance Facility Site D, south of Gilroy	To be evaluated in detail in EIR/EIS	This option was added in response to input from Morgan Hill and Gilroy and to reduce environmental effects in the vicinity of Coyote Creek Regional Park. A viaduct rather than an at-grade embankment would increase permeability for wildlife movement in the Coyote Valley, an important area for migration of various species including elk. The viaduct alignment west of US 101 would avoid residential and commercial displacements in downtown Morgan Hill and displacement of the Morgan Hill Aquatic Center and adjacent soccer fields, and would reduce the structural complexity and expense of crossing over US 101. This option would avoid effects on undeveloped land by siting the HSR station in downtown Gilroy, rather than using an East Gilroy Station option. This option would include a maintenance facility that meets operations and maintenance requirements, and avoids impacts upon parkland, wildlife movement, and agricultural land in Coyote Valley. This option would also reduce environmental effects for most resources, relative to the options that are withdrawn.
2. Embankment to Downtown Gilroy	Embankment east of UPRR along Monterey Rd and through Downtown Gilroy. Includes Maintenance Facility Site D, south of Gilroy	To be evaluated in detail in EIR/EIS	This option is potentially practicable and is carried forward for further analysis because it meets the project's purpose and need; it does not have the logistical, feasibility, and high cost issues of some of the withdrawn options; and it would avoid or minimize effects on Section 4(f) recreational resources including Coyote Creek Regional Park. This option would avoid the visual effects of an aerial option, but would have greater construction effects and disruption than an aerial option. This option would include a maintenance facility that meets operations and maintenance requirements, and avoids impacts upon parkland, wildlife movement, and agricultural land in Coyote Valley.
3. Viaduct to East Gilroy via Morgan Hill Bypass	Viaduct along Monterey Rd median from San Jose, then crossing Coyote Valley eastward to west side of US 101 around Morgan Hill, then westward to Monterey Rd through San Martin, then eastward across US 101 to east Gilroy station site. Includes Maintenance Facility Site C, east of Gilroy	To be evaluated in detail in EIR/EIS	This option was added in response to input from Morgan Hill and to reduce environmental effects in the vicinity of Coyote Creek Regional Park. A viaduct rather than an at-grade embankment would increase permeability for wildlife movement in the Coyote Valley, an important area for migration of various species including elk. The viaduct alignment west of US 101 would avoid residential and commercial displacements in downtown Morgan Hill and displacement of the Morgan Hill Aquatic Center and adjacent soccer fields, and would reduce the structural complexity and expense of crossing over US 101. This option would reduce conversion of raw land relative to options that follow a longer stretch of US 101. This option would avoid the land displacements of a guideway and station in downtown Gilroy and avoid acquisition of land owned by the UPRR for a downtown station site; it would reduce environmental effects on many resources relative to the options that are withdrawn. This option would include a maintenance facility that meets operations and maintenance requirements, and avoids impacts upon parkland, wildlife movement, and agricultural land in Coyote Valley.

Design Option	Description	Determination	Rationale
4. Blended, At-Grade to Downtown Gilroy	Blended, At-Grade within the UPRR railroad right-of-way and through downtown Gilroy. Includes Maintenance Facility south of Gilroy	To be evaluated in detail in EIR/EIS	This option is potentially practicable and is carried forward for further analysis because it meets the project's purpose and need; it does not have the logistical, feasibility, and high cost issues of some of the withdrawn options; and it would avoid or minimize disruption and noise impacts on existing local communities, benefit rail operations, and avoid the visual and spatial disruption associated with constructing a dedicated guideway on embankment or viaduct. This option would include a maintenance facility that meets operational and maintenance requirements and would avoids impact on parkland, wildlife movement, and agricultural land in Coyote Valley.
Design options withdrawn from further consideration			
5. US 101 Alignment to Downtown Gilroy	Follows US 101 to south of San Martin Airport, crosses over to Monterey Rd to a station in downtown Gilroy and maintenance facility south of Gilroy	Dismissed from further evaluation	Withdrawn because this alignment has greater environmental effects than options carried forward on the following resources: aquatic features, California red-legged frog, California tiger salamander, least Bell's vireo, tricolored blackbird, steelhead, San Joaquin kit fox, Bay checkerspot butterfly, and Metcalf Canyon jewelflower. It would require conversion of a greater extent of 100-year floodplains, parks, and agricultural land than the options carried forward. It would displace portions of the Morgan Hill Aquatic Center and associated soccer fields in Morgan Hill and would require a tunnel and trench to cross US 101 with associated disruption of local land use and infrastructure.
6. US 101 Alignment to East Gilroy	Follows US 101 to a station and maintenance facility in East Gilroy	Withdrawn in Checkpoint B Addendum 2017	Withdrawn because this alignment has greater environmental effects than the options carried forward on the following resources: aquatic features, California red-legged frog, California tiger salamander, least Bell's vireo, tricolored blackbird, steelhead, Bay checkerspot butterfly, San Joaquin kit fox, Metcalf Canyon jewelflower, and Santa Clara Valley dudleya. The US 101 to East Gilroy option would also convert a greater extent of important agricultural land than the options carried forward and would displace portions of the Morgan Hill Aquatics Center and associated soccer fields and portions of Coyote Creek Regional Park.
7. East of UPRR to East Gilroy	Embankment east of UPRR along Monterey Rd to San Martin, then east across US 101 to East Gilroy	Withdrawn in Checkpoint B Addendum 2017	Withdrawn because this alignment has greater environmental effects than the options carried forward on the following resources: California red-legged frog, least Bell's vireo, Swainson's hawk, tricolored blackbird, steelhead, Bay checkerspot butterfly, San Joaquin kit fox, Metcalf Canyon jewelflower, Santa Clara Valley dudleya, and built environment resources. The footprint for this option would require more conversion of 100-year floodplain, important agricultural land, and residential housing than the options carried forward. The East of UPRR to East Gilroy option would also affect a greater extent of land in conservation easements. These effects are associated with a relatively larger at-grade footprint. This option would also create substantial disruption to local infrastructure use and land uses as it crosses over from east of the UPRR right-of-way to east of US 101 north of Gilroy.

Design Option	Description	Determination	Rationale
8. West of Coyote Creek to Downtown Gilroy	From Monterey Rd, transitions to a US 101 alignment south of Coyote Creek Pkwy, then transitions back to Monterey Rd south of San Martin Airport	Withdrawn in Checkpoint B Addendum 2017	Withdrawn because this alignment has greater environmental effects than the options carried forward on the following resources: aquatic features, California red-legged frog, California tiger salamander, least Bell's vireo, Swainson's hawk, tricolored blackbird, steelhead, Bay checkerspot butterfly, San Joaquin kit fox, Metcalf Canyon jewelflower, Santa Clara Valley dudleya, and built environment cultural resources. This option would convert a greater amount of 100-year floodplain and important agricultural land than the options carried forward. This option would require demolition of more residences (in number and square footage) than the options carried forward. This option would also displace portions of the Morgan Hill Aquatics Center and associated soccer fields and portions of Coyote Creek Regional Park. It would require a combination of tunnel and trench to cross under US 101, with substantial disruption to local land uses and cost.
9. West of Coyote Creek to East Gilroy	From Monterey Rd, transitions to a US 101 alignment south of Coyote Creek Pkwy then to east Gilroy station	Withdrawn in Checkpoint B Addendum 2017	Withdrawn because this alignment has greater environmental effects than the options carried forward on the following resources: aquatic features, California red-legged frog, least Bell's vireo, tricolored blackbird, steelhead, Bay checkerspot butterfly, San Joaquin kit fox, Metcalf Canyon jewelflower, and Santa Clara Valley dudleya. The at-grade and embankment crossover between the Monterey corridor and US 101 would obstruct wildlife movement in the Coyote Valley. This option would also convert more important agricultural land, 100-year floodplain, conservation easements, and parks (both number and acreage) than the options carried forward, and would displace portions of the Morgan Hill Aquatics Center and associated soccer fields
10. Gilroy Station Loop	Mainline track along east Gilroy alignment with spur track to downtown Gilroy; two-track downtown Gilroy station and grade-separated flyovers where mainline and spur meet north and south of Gilroy	Withdrawn in the PAA and Checkpoint B 2013	Withdrawn from further analysis due to prohibitive cost and visual effects, this option would result in the combined cost and effects of building both an east Gilroy alignment and a downtown Gilroy alignment. This alignment option would have the greatest aesthetic/visual effects of all alignment options in this subsection due to the double alignment.
11. Foothills	Alignment along the east side of Santa Clara Valley in the Morgan Hill and Gilroy area	Withdrawn in 2005 Statewide Program EIR/EIS	Withdrawn from further investigation in the 2005 Statewide Program EIR/EIS because it would have potentially substantial effects on sensitive habitat through the foothills and would have high visual effects. The Morgan Hill (Foothills) and the Morgan Hill (east of US 101) station sites were eliminated from further investigation in the 2005 Statewide Program EIR/EIS because they would have poor connectivity and accessibility and would not meet the basic program objectives. No new information has been identified by the Authority subsequent to the Program EIR/EIS that would change the prior conclusion.

Design Option	Description	Determination	Rationale
12. Downtown Gilroy Tunnel	Tunnel in downtown Gilroy (~4 miles)	Originally considered in 2013; reconsidered due to public outreach in 2017; withdrawn	Withdrawn from further analysis due to prohibitive cost; assuming cut-and-cover cost of $270 million per mile and bored tunnel cost of $310 million per mile, cost could be $1.1–1.3 billion, not including cost of underground Gilroy station. Costs for tunnel options far exceed embankment and viaduct options carried forward (estimated cost of viaduct for 4 miles would be $500 million assuming $125 million per mile). Tunnel could have substantial effects on groundwater hydrology and supply due to shallow water table, as well as substantial disruption to downtown Gilroy during construction of cut-and-cover tunnel.
13. Morgan Hill to Gilroy Tunnel	Tunnel from north of Morgan Hill to south of Gilroy (15 miles)	Considered due to public outreach in 2017; withdrawn	Withdrawn from further analysis due to prohibitive cost; assuming cut-and-cover cost of $270 million per mile and bored tunnel cost of $310 million per mile, cost could be $4.0–4.7 billion, not including cost of underground Gilroy station. Costs for tunnel options far exceed embankment and viaduct options carried forward (estimated cost for viaduct for 16 miles, including Morgan Hill Bypass, would be $2.0 billion, excluding Gilroy station, assuming $125 million per mile). Tunnel could have substantial effects on groundwater hydrology and supply due to shallow water table, as well as substantial disruption to downtown Gilroy during construction of cut-and-cover tunnel.
14. Gilroy US 101 Alignment	From Buena Vista Avenue, transition to US 101, then along the east side, median, or west side of US 101 to south of downtown	Considered due to public outreach in 2017; withdrawn	A US 101 alignment through Gilroy does not meet the Authority's and CPUC's station area policy on TOD. Only the two existing downtown Gilroy alignments meet TOD requirements. Through a qualitative analysis, potential variant alignments along US 101 do not offer any benefits over the existing downtown alignments. Although the downtown Gilroy alignments may be disruptive during construction, the long-term economic, pedestrian, vehicular, and intermodal connectivity benefits are quite substantial. Among the US 101 variants, the west of US 101 alignment has the least amount of impacts. However, it is still a still highly disruptive alignment that involves many straddle-bent structures, disruption to a PG&E high-voltage power line, impacts on several residential and industrial properties, and impacts on a public park. In light of these infrastructure impacts, the US 101 Gilroy alignment would not be consistent with the City's desire to minimize impacts on residences and businesses. Additionally, the Authority does not consider any of the US 101 Gilroy alignment variants analyzed as likely to be considered the Least Environmentally Damaging Practicable Alternative.
▪ Maintenance Facility "A"	Adjacent to Monterey Rd on the east side between Morgan Hill and San Jose; would work with west of Coyote Creek alignments only	Withdrawn in Checkpoint B Addendum 2017	Withdrawn because the location does not meet operations and maintenance requirements, would encroach on Coyote Creek Regional Park land and agricultural land, and would obstruct wildlife movement in the constrained corridor of Coyote Valley.
▪ Maintenance Facility "B"	Adjacent to Monterey Rd on the east side between Morgan Hill and San Jose; would work with Monterey Rd alignments only	Withdrawn in Checkpoint B Addendum 2017	Withdrawn because the location does not meet operations and maintenance requirements, would encroach on Coyote Creek Regional Park land and agricultural land, and would obstruct wildlife movement in the constrained corridor of Coyote Valley.

Pacheco Pass Subsection Design Options Considered

The Authority and FRA considered three design options for the Pacheco Pass Subsection, as illustrated on Figure 15.

The Bay Area to Central Valley EIR/EIS (and the Revised EIR and Partially Revised EIR) identified the SR 152 corridor over Pacheco Pass as the preferred route for connecting the Bay Area and Central Valley portions of the HSR system. In the PAA, SAAs, and 2013 Checkpoint B Summary Report, the Authority identified two potential design options for the route. The Close Proximity to SR 152 design would entail a combination of embankment, viaduct, and tunnels along SR 152. The RPA is the same as the Close Proximity to SR 152 option where it crosses over SR 152, but diverges to the north at San Luis Reservoir to cross at the narrower part of the Cottonwood Creek arm of the reservoir. Both design options were recommended to be carried forward in the 2013 Checkpoint B Summary Report.

After reinitiating design and environmental work on the Project Section in late 2015, the Authority continued to consult with the U.S. Department of the Interior, Bureau of Reclamation, which (along with the California Department of Water Resources) urged complete avoidance of the San Luis Reservoir, and the California Department of Fish and Wildlife, which urged minimization of any surficial encroachment within the Cottonwood Creek Wildlife Area. The Authority subsequently developed a new option, the Tunnel, which would include a 13.5-mile tunnel and avoid any encroachment into the San Luis Reservoir or surficial encroachment into the Cottonwood Creek Wildlife Area. Once the Tunnel design was determined to be practicable, the other two designs were withdrawn from further consideration because they would have substantially greater effects on aquatic resources, special-status species habitat, and 4(f) resources than the new tunnel option. The analysis of the two withdrawn options and the new tunnel option are documented in the 2017 Checkpoint B Summary Report Addendum 3 (Authority 2017). In 2017, the Authority continued to consult with stakeholders and refine the design to reduce impacts on known resources including Romero Creek and the operations of Romero Ranch. The alignment included three crossings of Romero Creek and a traversal of Romero Ranch. The Authority subsequently adjusted the alignment northward (half in tunnel and half at the eastern end of the subsection) to provide one crossing of Romero Creek and to reduce encroachments on highly sensitive Romero Creek species and sensitive habitat as well as on ranch calving pastures and headquarters. Once the Romero Ranch realignment was determined to be practicable, the other alignment was withdrawn from further consideration because it would have substantially greater effects on creek species and sensitive habitat than the new alignment.

Table 6 shows the design options considered for this subsection and the rationale for inclusion or withdrawal from further consideration in this Final EIR/EIS. With elimination of the other design options, one design for the Pacheco Pass Subsection is included in the alternatives being considered in this Final EIR/EIS: Tunnel. This design option is described in greater detail in Section 2.5.

MARCH 2019

Figure 15 Design Options Considered in the Pacheco Pass Subsection

Table 6 Pacheco Pass Subsection: Design Options Considered

Design Option	Description	Determination	Rationale
Design option to be evaluated in detail in the Final EIR/EIS			
1. Tunnel	Predominantly a 13.5-mile tunnel north of SR 152	To be evaluated in detail in EIR/EIS	This option was added because it would avoid crossing the San Luis Reservoir and associated potential effects on water storage capacity and recreational uses, and would avoid surficial use of the Cottonwood Creek Wildlife Area (a Section 4(f) property). Subsequent refinements reduced the crossing of Romero Creek from three to one and provided for the continued operation of Romero Ranch and the movement of wildlife. The two options the Authority proposes to withdraw would affect the reservoir, requiring major steps to maintain the ongoing safety of the reservoir and to avoid decreases in water storage capacity, and would alter the ground surface within the Cottonwood Creek Wildlife Area, a use that would affect recreation and wildlife resource values. The Tunnel option would use more tunneling compared to at-grade or viaduct guideway, with an associated reduction of effects on the surface landscape.
Design options withdrawn from further consideration			
2. Close proximity to SR 152	Combination of embankment, viaduct, and tunnels along SR 152	Withdrawn in 2017 Checkpoint B Addendum	Withdrawn because it would encroach upon the San Luis Reservoir with associated effects on water storage capacity. This option has greater environmental effects than the Tunnel option on aquatic resources, California red-legged frog, California tiger salamander, least Bell's vireo, Swainson's hawk, tricolored blackbird, steelhead, San Joaquin kit fox, blunt-nosed leopard lizard, and giant garter snake. The option would have more extensive effects on 100-year floodplains, important agricultural land, lands under conservation easement, parks (both in number and acreage), the Cottonwood Creek Wildlife Area, and the San Luis Reservoir State Recreation Area.
3. Refined Program Alignment (RPA)	Combination of embankment, viaduct, and tunnels farther from SR 152.	Withdrawn in 2017 Checkpoint B Addendum	Withdrawn because it would encroach upon the San Luis Reservoir with associated effects on water storage capacity and recreational uses. The RPA has greater effects on aquatic resources, California red-legged frog, California tiger salamander, least Bell's vireo, Swainson's hawk, tricolored blackbird, steelhead, San Joaquin kit fox, and blunt-nosed leopard lizard. This option would convert more 100-year floodplain and important agricultural land and would affect more parks (number and acreage) and more acreage of the Cottonwood Creek Wildlife Area and the San Luis Reservoir State Recreation Area (which is avoided by the Tunnel option).

San Joaquin Valley Subsection Design Options Considered

The Authority and FRA considered three horizontal design options for the San Joaquin Valley Subsection, as illustrated on Figure 16.

In the PAA, SAAs, and 2013 Checkpoint B Summary Report, the Authority and FRA analyzed design options for the complete San Jose to Merced Project Section. Subsequently, the Authority and FRA decided to analyze the Central Valley Wye alternatives separately in a Supplemental EIR/EIS to the Merced to Fresno EIR/EIS and to focus on the alignments west of the Central Valley Wye in this Final EIR/EIS.

During the PAA, SAA, and 2013 Checkpoint B Summary Report analyses, three primary routes were considered east of the Pacheco Pass subsection: a central route predominantly along Henry Miller Road to Carlucci Road and then various Central Valley Wye options; a northern route using SR 140; and a southern route through Firebaugh.

The northern route, GEA North/Merced, would proceed northeast from near I-5 across SR 33 and then along SR 140 east toward Merced. The Authority determined that this option would result in substantially greater effects on aquatic resources than the alignment along Henry Miller Road; would be the only option to affect the North Grasslands Wildlife Area; would have high visual intrusiveness associated with a river crossing within a state park; and would add 4 minutes of travel time between San Francisco and Los Angeles, likely making it inconsistent with the travel time objective under Proposition 1A of 2 hours 40 minutes between the Transbay Terminal in San Francisco and Los Angeles Union Station.

The southern route, South of GEA, would proceed south along I-5 to past SR 165, then east through Firebaugh to meet the north-south route between Madera and Fresno. The Authority determined that this option would have the greatest effect on aquatic resources of all options considered in this subsection and would have high cost and logistical issues due to its extensive environmental effects and additional miles of alignment compared to other options considered.

Public meetings, Community Working Group meetings, Technical Working Group meetings, and stakeholder and agency meetings were conducted in 2016 and 2017, during which the public expressed concern about the potential environmental effects of the Henry Miller Road to Carlucci Road option. Impacts on farmlands, properties, dairies, wetlands, wildlife, and water infrastructure were of particular concern. As part of the Program EIR/EIS Tier 1 environmental process, the Authority committed to 3 miles of an elevated profile adjacent to the GEA and to the purchase of 10,000 acres of conservation easements to avoid and reduce impacts to wildlife species. The Authority also consulted in 2016 and 2017 with irrigation districts, the San Luis and Delta-Mendota Water Authority and U.S. Department of the Interior, Bureau of Reclamation on design refinements to be included in the project to minimize infrastructure conflicts and land use displacement/disruptions. Although the Henry Miller alignment would affect farmlands and dairies, as noted above, the alternatives that avoided Henry Miller Road would have had substantially higher impacts on aquatic resources, which would make them difficult, if not impossible to permit by the U.S. Army Corps of Engineers.

Several vertical design options were also considered by the Authority for the San Joaquin Valley Subsection during preliminary engineering, including the following:

- *Addressing Bird/Wildlife Issues with Barriers/Enclosures or Tunnel*: Due to concerns about potential effects of elevated vertical alignments (embankment or viaduct) along Henry Miller Road on birds and other wildlife due to visual effects, noise effects, and bird strike effects within the GEA, the Authority explored three different approaches to addressing these impacts. The first approach, which has been incorporated into the project through Mitigation Measure BIO-MM#80, is to build additional structures in the San Joaquin Valley Subsection in sensitive wildlife areas to address these impacts. Structures would be designed with the goal of reducing or eliminating the visual presence of the moving train and reducing noise. Opaque noise barriers would be built in the GEA Important Bird Area (IBA) near Volta, between Stations B4550+00 and B4630+00. The second approach would be occur for approximately 3.4 miles in the GEA IBA, centered approximately at Mud Slough between

Stations B4914+00 and B5095+00, where the rail design would be modified to enclose the train's operating envelope and overhead contact system. The Authority also considered a third approach that would use an underground tunnel in sensitive wildlife areas in the GEA. Tunneling is a cost-prohibitive approach because it is substantially more expensive than aboveground embankment or viaduct approaches, even when including aboveground mitigation in the form of noise barriers or enclosures. As discussed in Volume 2, Appendix 2-I for tunnel options for the Monterey Corridor, cut-and-cover tunnel options can be approximately 2 times and bored tunnel options can be approximately 2.5 times more costly than a viaduct option. As a result, the Authority determined a tunnel alternative for portions of the San Joaquin Valley Subsection would be not feasible for reasons of cost.

- *Additional Viaduct Sections:* The Authority also considered a potential viaduct crossing of the existing Whitworth Road overcrossing (near the I-5 California Highway Patrol [CHP] Inspection/Weigh Station) and a viaduct section instead of embankment west of I-5. A horizontal alignment closer to the CHP Inspection/Weigh Station that allowed a lower HSR profile would require reconstruction and realignment of the Whitworth Road interchange, resulting in additional impacts on prime farmland compared to the horizontal and vertical alignment in the Draft EIR/EIS. The viaduct alignment to the west of I-5 had impacts similar to the horizontal and vertical alignment in the Draft EIR/EIS, so it did not provide any environmental advantages. Thus, this additional viaduct alignment option was dismissed from further consideration because it did not reduce any environmental impacts associated with the proposed alignment.

The Authority concluded that the issues raised by public concerns were previously considered in the 2013 Checkpoint B Summary Report, prior Tier 1 commitments and additional design refinements were responsive to concerns raised earlier and in 2016 and 2017 and that the prior conclusions regarding the design options to be carried forward or withdrawn from further consideration remained valid.

Table 7 shows the design options considered in this subsection and the rationale for inclusion or withdrawal from further consideration in this Final EIR/EIS. The central route (Henry Miller Road to Carlucci Road) was determined to be practicable and to result in less effects on aquatic resources than the other two options and was carried forward for analysis in this EIR/EIS. This design option is described in greater detail in Section 2.5.

MARCH 2019

Figure 16 Horizontal Design Options Considered in the San Joaquin Valley Subsection

Table 7 San Joaquin Valley Subsection: Design Options Considered

Design Option	Description	Determination	Rationale
Design option to be evaluated in detail in Final EIR/EIS			
1. Predominantly Henry Miller Rd to Carlucci Rd	Mostly at-grade alignment with some viaduct or embankment	To be evaluated in detail in EIR/EIS	Lesser effects on wetlands than northern and southern alignments.
Design options withdrawn from further consideration			
2. Grasslands Ecological Area (GEA) North/ Merced	Across SR 33 to SR 140 to Merced	Withdrawn in the PAA and 2013 Checkpoint B Report	Withdrawn from further analysis because the potential effects on aquatic resources would be substantially greater than those of the alignment along Henry Miller Rd, and it would be the only option to affect the North GEA. This option would result in high visual intrusiveness by adding an HSR river crossing within a state park. Further, this option would add 4 minutes of travel time between San Francisco and Los Angeles, likely making it inconsistent with the travel time objective of Proposition 1A (2 hours 40 minutes between Los Angeles Union Station and San Francisco). Because it is inconsistent with Proposition 1A, this option does not meet the project's purpose and need.
3. South of GEA	South along I-5 past SR 165, then east through Firebaugh to SR 99 corridor between Madera and Fresno	Not included in program-level corridors, but analyzed and withdrawn in the PAA and 2013 Checkpoint B Report	The South of GEA option was not included in one of the program-level corridors. This option was withdrawn from further analysis because it would have the greatest effect on aquatic resources of options considered and would have high cost and logistical issues due to its extensive environmental effects and additional miles of alignment compared to the design option carried forward.
4. GEA Tunnel	Tunnel along Henry Miller Road for areas adjacent to sensitive wildlife areas in the GEA	Considered and eliminated as part of preliminary engineering	Tunneling is a cost-prohibitive approach because it is substantially more expensive than aboveground embankment or viaduct approaches, even when including aboveground mitigation in the form of noise barriers or enclosures. As a result, the Authority determined a tunnel alternative for portions of the San Joaquin Valley Subsection would be not feasible for reasons of cost.

Design Option	Description	Determination	Rationale
5. Viaduct Crossing of the Whitworth Road overcrossing of I-5/Viaduct west of I-5	Viaduct crossing and viaduct west of I-5 instead of embankment	Considered and eliminated as part of preliminary engineering/environmental evaluation	A horizontal alignment closer to the CHP Inspection/Weigh Station that allowed a lower HSR profile would require reconstruction and realignment of the Whitworth Road interchange, resulting in additional impacts on prime farmland compared to the horizontal and vertical alignment in the Draft EIR/EIS. The viaduct alignment to the west of I-5 had impacts similar to the horizontal and vertical alignment in the Draft EIR/EIS, so it did not provide any environmental advantages. Thus, this additional viaduct alignment option was dismissed from further consideration because it did not reduce any environmental impacts associated with the proposed alignment.

APPENDIX 2-J: REGIONAL AND LOCAL PLANS AND POLICIES

APPENDIX 2-J: REGIONAL AND LOCAL PLANS AND POLICIES

Since publication of the Draft Environmental Impact Report (EIR)/Environmental Impact Statement (EIS), the following substantive changes have been made to this appendix:

- This appendix was updated to include *Envision: San José 2040 General Plan* (City of San Jose 2011) policies ES-3.1 and ES 3.24 in Table 11 and the *Santa Clara Valley Agricultural Plan* (County of Santa Clara and Santa Clara Valley Open Space Authority 2018), *Santa Clara Valley GreenPrint* (Santa Clara Valley Open Space Authority 2014), and *Pajaro River Watershed Integrated Regional Water Management Plan* (Pajaro River Watershed Integrated Regional Water Management 2014) in Table 14.
- Table 6 was updated to note that the Santa Clara County General Plan also addresses biological resources under the Resource Conservation chapter and land uses relevant to biological resources under the Land Use chapter of Part 3 of the General Plan in Book B, which addresses Rural Unincorporated Area Issues & Policies. Additional summary detail was added to the description of Santa Clara County Code of Ordinances, Title C—Construction, Development and Land Use, Division C16, Tree Preservation and Removal.

The San Jose to Central Valley Wye project extent travels through Santa Clara, San Benito, and Merced counties and the cities of Santa Clara, San Jose, Morgan Hill, Gilroy, and Los Banos. This appendix provides a list of relevant regional and local plans and policies considered in the preparation of this analysis by resource area. The plans, goals, and policies are presented geographically following the proposed alignment from San Jose to Carlucci Road. All plans and policies have been adopted unless otherwise noted.

Transportation

Table 1 Regional and Local Plans and Policies Relevant to Transportation

Plan and Policies	Summary
Regional	
Plan Bay Area 2040 (2017)	The Association of Bay Area Governments (ABAG) and the Metropolitan Transportation Commission (MTC) adopted *Plan Bay Area 2040* on July 26, 2017 as the Bay Area's long-term regional transportation plan and sustainable communities strategy. The plan includes the following goals and targets relevant to transportation: Goal: Transportation System Effectiveness ▪ Target 11: Increase non-auto mode share ▪ Target 12: Reduce vehicle operating and maintenance costs due to pavement conditions ▪ Target 13: Reduce per-rider transit delay due to aged infrastructure
Merced County Regional Transportation Plan (2016)	The Merced County Association of Governments (MCAG) adopted *Regional Transportation Plan 2014-2040* on September 25, 2014; and an amended version on May 19, 2016 as the County's long-term regional transportation plan and sustainable communities strategy. The plan includes the following goals and targets relevant to transportation: Goal: A rail system that provides safe and reliable service for passengers. ▪ 3.1. Maintain adequate passenger service on Amtrak San Joaquin route. 3.1.1. Monitor the activities of Amtrak to assure passenger rail services in Merced County. ▪ 3.2. Establish a High Speed Rail system connecting Merced and Los Banos to Sacramento and the Bay Area. 3.2.1. Support the High Speed Rail planning process and actively provide comments and input.

Plan and Policies	Summary
	Goal: Provide a transportation system that enables safe movement of goods in and through Merced County. ▪ 4.1. Provide an adequate regional road system for goods movement. 4.1.1. Support and participate in the Valley-wide Goods Movement Study. 4.1.2. Work with the Freight Advisory Committee to enhance and maintain a viable transportation system for freight and goods movement. Goal: A regional transportation system for bicyclists and pedestrians. ▪ 6.1. Develop and construct bike and walkway facilities in urban areas and other communities where non-motorized systems do not currently exist. 6.1.1. Construct class I, II and III bike routes as designated in the local and regional plans. 6.1.2. Actively pursue bicycle and pedestrian related funding sources to implement local and regional plans. ▪ 6.2. Prepare and/or update a regional active transportation / non-motorized plan every five years. 6.2.1. Create an Advisory Committee or use existing groups for bike planning and project implementation recommendations. 6.2.2. Implement the projects and programs in the plan. ▪ 6.3. Develop and construct walkway facilities in urban areas and other communities where pedestrian systems do not currently exist. 6.3.1. Actively pursue pedestrian related funding sources to implement local and regional plans. Goal: Develop and support financing strategies that provide for a continuous implementation of the Regional Transportation Plan projects and strategies. ▪ 10.1. Develop and adopt policies that will provide adequate funding resources for all transportation modes and strategies. 10.1.1. Seek voter approval of ballot measure for a 1 percent or ½ percent per dollar increase in the sales tax, for transportation system maintenance and improvements. 10.1.2. Implement and manage a regional transportation development fee program for priority road and transit improvement projects. 10.1.3. Provide technical assistance to local jurisdictions in the development of transportation financing mechanisms. 10.1.4. Consider cost efficiency in project evaluation criteria. Goal: Reduce per capita greenhouse gas emissions through compact growth and alternative transportation strategies. ▪ 12.2 Prioritize funding for complete street projects on existing corridors. Prioritize investment in active travel, including investments in necessary infrastructure (sidewalks, streetlights, curb and gutter, bike lanes, and other pedestrian safety measures) to promote increased walking and biking. Establish and implement a complete streets policy as aggressively as possible that requires its member jurisdictions to accommodate all transportation users through the incorporation of sidewalks, streetlights, curb and gutter and bicycle infrastructure in all projects, prioritizing existing streets and roads. ▪ 12.6 Prioritize vanpools and ridesharing. Prioritize funding for vanpool and ridesharing programs to expand them and encourage their use. Investigate creative transit options for rural communities such as informal ridesharing and subsidized ridesharing to supplement paratransit. Increase efforts to encourage employers to give or increase

Plan and Policies	Summary
	incentives for employees to rideshare. Investigate the feasibility of dedicating high-occupancy vehicle (HOV) lanes on highways and multi-lane roadways. ▪ 12.9 Transit. Improve access to public transit in rural and urban areas. Re-Evaluate and update the definitions of "unmet transit needs" and "reasonable to meet" to broaden and expand service to rural areas. While continuing to invest in existing urban service, identify new funding sources for improvements to service in rural areas.
Moving Forward 2035 Monterey Bay (2017)	The Association of Monterey Bay Area Governments (AMBAG) adopted *Moving Forward 2035 Monterey Bay* on January 11, 2017 as Monterey Bay's long-term regional transportation plan and sustainable communities strategy. The plan includes the following goals and targets relevant to transportation: Goal: Access and Mobility ▪ Provide convenient, accessible, and reliable travel options while maximizing productivity for all people and goods in the region. Goal: Economic Vitality ▪ Raise the region's standard of living by enhancing the performance of the transportation system. Goal: Healthy Communities ▪ Protect the health of our residents; foster efficient development patterns that optimize travel, housing, and employment choices and encourage active transportation. Goal: Social Equity ▪ Provide an equitable level of transportation services to all segments of the population. Goal: System Preservation and Safety ▪ Preserve and ensure a sustainable and safe regional transportation system.
Caltrain Strategic Plan (2014)	The *Caltrain Strategic Plan* was adopted on September 4, 2014 and establishes a roadmap for the next 10 years to reinforce Caltrain's existing commitments and service as a comprehensive policy framework from 2015 to 2024. The plan is organized into focus areas with goals and objectives. Focus Area 5: Transportation & Land Use, includes the following goals and objectives applicable to transportation: Goal A. Improve connectivity to local and regional transportation systems. 1. Explore mutually beneficial ways to plan and coordinate services with local transit providers. 2. Prioritize partnerships and efforts related to key intermodal stations including the Transbay Transit Center, Millbrae, and San Jose Diridon. 3. Improve physical, electronic and web-based intermodal way finding and transfer information. 4. Participate in and influence regional initiatives related to the integration of fares and payment, information systems and marketing. Goal B. Improve multimodal station access. 1. Develop a station access plan based on the Caltrain Access Policy Statement. 2. Reduce the incidence of "bike bumps" by complementing the bikes onboard program with improved capacity. 3. Pursue strategies that enhance first- and last-mile connections to stations. Goal C. Encourage transit supportive development at and around stations. 1. Adopt a transit-oriented development policy. 2. Participate in and influence local station area planning efforts along the corridor. 3. Develop Peninsula Corridor Joint Powers Board (PCJPB) real estate assets in a way that supports the system financially and operationally with local land use goals.

Plan and Policies	Summary
	Goal D. Integrate with California's statewide rail network. 1. Support implementation of the Caltrain/HSR blended system in the Peninsula Corridor with consideration of local community interests and concerns. 2. Continue to accommodate freight and passenger tenants whose operations are compatible with Caltrain and blended system service, and support compatibility between passenger and freight service to the extent possible. 3. Partner with [California High-Speed Rail Authority], [Transbay Joint Powers Authority], and the region, define roles and responsibilities, and implement the blended system.
Santa Clara County	
Santa Clara County General Plan (1994)	The *Santa Clara County General Plan* was adopted on December 20, 1994. It establishes the overall policy framework for countywide land use and urban development, including transportation. The plan includes the following policies relevant to the transportation: Transportation and Energy Conservation (TR) ▪ C-TR 1: Santa Clara County should develop and maintain an adequate, balanced, and integrated transportation system that is affordable and convenient to use and that is capable of meeting projected future demand. ▪ C-TR 2: An adequate transportation system for Santa Clara County should be considered essential for improving overall quality of life, including: a. Continued economic development and increased living standards; b. Enhanced environmental quality; and c. Improved livability of urbanized areas. ▪ C-TR 3: In order to safeguard future mobility and achieve other transportation-related goals and objectives stated in the Vision of General Plan, the following set of coordinated strategies should guide decision-making and implementation efforts on a sub-regional basis: a. Develop urban land use patterns that support travel alternatives; b. Manage travel demand, system operation, and congestion levels; c. Expand system capacity and improve system integration; and d. Support new transportation technologies. ▪ C-TR 4: Overall transportation planning for Santa Clara County should be integral and consistent with the goals and objectives of comprehensive, countywide planning regarding urban growth management, compact and mixed use development patterns, environmental quality, and social and economic well-being. ▪ C-TR 5: The transportation plans and the land use plans, specific plans, and redevelopment plans of local jurisdictions should be consistent and mutually reinforcing in order to enhance transportation infrastructure investment. ▪ C-TR 8: Urban design concepts and site development standards which facilitate use of transit and other travel alternatives should be adopted and implemented by local jurisdictions, to provide adequate: a. Accessibility to transit and transit facilities; b. Pedestrian and bicycle pathways and facilities, both on and between individual sites; and c. Building design, orientation, on-site services and amenities which support the use of travel alternatives. ▪ C-TR 10: Transportation System Management measures should be employed to ensure maximum operating efficiency of the existing system of roads and highways, including but not limited to the following:

Plan and Policies	Summary
	a. Signal synchronization, signal pre-emptions for transit vehicles; b. Ramp metering; and c. Traffic surveillance and traffic advisory signals. ▪ C-TR 12: It is the goal of this plan to achieve a level-of-service (LOS) no lower than D at peak travel periods on city streets, county roads, expressways and state highways. However, in certain instances, a lower level of service may be acceptable when LOS D cannot practically be achieved. ▪ C-TR 15: Increase the overall physical capacity of the transportation system to meet projected demand, primarily through the following means: a. Increased transit system capacity and service levels for light rail, passenger rail, and bus transit; b. Increased paratransit, bike and pedestrian facilities and service; and c. Roadway capacity improvements to improve interchanges and complete the commuter lane network. ▪ C-TR 16: Provide a balanced and integrated transportation system, which will allow for alternative means of travel and opportunities for transfer between alternative means. ▪ C-TR 17: Development of the local transportation system should be coordinated with the regional and inter-regional transportation systems to ensure they are fully integrated with each other. ▪ C-TR 18: The entire transportation system should be fully accessible to and be planned and designed to be responsive to the special needs of seniors, school children, low-income, the physically challenged and transit disabled in accordance with the Americans with Disabilities Act of 1990. ▪ C-TR 20: An integrated system of local, regional and inter-regional rail service should be developed. ▪ C-TR 21: Local transit systems should be integrated with the local and regional transit systems of adjacent counties. ▪ C-TR 22: The use of existing railroad rights-of-way for transit and alternative transportation (i.e., bicyclists and pedestrians) should be encouraged. ▪ C-TR 24: Support the use of the rail transit system by establishing a feeder system that would enable travelers to access rail stations without the use of their private vehicle. ▪ C-TR 25: Priority should be given to sustaining a base level of service on major grid bus lines. ▪ C-TR 29: Improve transit accessibility to schools. ▪ C-TR 35: A bicycle transit system should be provided that is safe and convenient for the user and which will provide for the travel needs of bicyclists. ▪ C-TR 36: Facilities should be provided to make bicycle and pedestrian travel more safe, direct, convenient and pleasant for commuting and other trips to activity centers and to support the use of other commute alternatives. ▪ C-TR 42: Development and application of advanced transportation-related technologies should be supported to meet current and future travel demand, minimize economic productivity losses due to roadway congestion, and increase travel safety.
Santa Clara Countywide Bicycle Plan (2008)	The Santa Clara Valley Transportation Authority (VTA) first established a Countywide Bicycle Plan in 2000, with the most recent updates made in 2008. The primary purpose of the plan is the create easier and safer bicycle travel between cities in Santa Clara County by establishing a network of bikeway corridors and identifying locations where new and improved bike connections are needed. The plan includes the following goals and policies relevant to transportation:

Plan and Policies	Summary
	Goal A. Transportation Planning and Programming ▪ Policy 1: Plan and implement a seamless bicycle and pedestrian travel network that is continuous across city boundaries and county boundaries with a goal of a 10 percent bicycle mode share for commute trips by 2035. ▪ Policy 2: Include bicycle and pedestrian facilities in applicable transportation plans, programs, and studies. ▪ Policy 3: Coordinate with other federal, state, regional, county and local agencies to fund and implement bicycle projects in Santa Clara County. ▪ Policy 4: Fully integrate bicycle access to and within the transit system. ▪ Policy 5: Utilize multi-modal transportation demand models that are based on person-trips and that can forecast bicycle trips, pedestrian trips and transit trips in addition to motor vehicle trips. Goal B. Land Use Planning ▪ Encourage existing developments to provide bicycle/pedestrian connections to link neighborhoods and residential areas with schools, commercial services, employment centers, recreational areas and transit centers. ▪ Policy 2: Encourage new developments to include bicycle and pedestrian such as trails and bicycle lanes. ▪ Policy 3: Encourage new developments to provide mobility for pedestrians and bicyclists by providing non-motorized connections and access ways such as cul-de-sac connections, pathways and other short-cuts to schools, transit centers and other adjacent destinations. ▪ Policy 4: Ensure that existing bicycle facilities and access are maintained and preserved. Goal D. Design and Construction – Infrastructure ▪ Policy 1. Ensure that Member Agency construction or rehabilitation projects incorporate best practices for bicycle and pedestrian facilities when and where appropriate. ▪ Policy 2: Implement proactive strategies to identify and remove obstacles and hazards to bicycle travel. ▪ Policy 3: Consider roadway designs to enhance traffic safety. ▪ Policy 4: Establish guidelines for and encourage the use of bicycle-safe and friendly roadway and bike path design and operation.
City of Santa Clara	
City of Santa Clara 2010–2035 General Plan (2010)	The Santa Clara City Council adopted the *City of Santa Clara 2010–2035 General Plan* on November 16, 2010. The plan represents a long-range vision supported by strategies and policies for managing changing priorities and development pressures. The plan includes the following goals and policies relevant to transportation: 5.1.1 Prerequisite Goals and Policies ▪ 5.1.1-G4: Development of a multimodal transportation system that reduces the reliance on owning and driving single-occupant vehicles. 5.3.1 General Land Use Goals and Policies ▪ 5.3.1-G1: Reduced dependence on the single-occupant automobile. ▪ 5.3.1-G3: Development that minimizes vehicle miles traveled, capitalizes on public investment in transit and infrastructure, and is compatible with surrounding uses. ▪ 5.3.1-P9: Require that new development provide adequate public services and facilities, infrastructure, and amenities to serve the new employment and residential growth.

Plan and Policies	Summary
	▪ 5.3.1-P12: Encourage convenient pedestrian connections within new and existing developments. ▪ 5.3.1-P15: Require new developments and major infrastructure projects to include adequate rights-of-way to accommodate all modes of transportation. ▪ 5.3.1-P29: Encourage design of new development to be compatible with, and sensitive to, nearby existing and planned development, consistent with other applicable General Plan policies. 5.3.4 Mixed Land Use Goals and Policies ▪ 5.3.4-P15: Maximize opportunities to connect streets, bicycle facilities and pedestrian pathways to improve accessibility between mixed-use development and surrounding neighborhoods, parks, open spaces, transit and public amenities. Provide clear signage, high visibility, adequate lighting and special paving to enhance pedestrian and bicycle facilities. 5.3.5 Office and Industrial Land Use Goals and Policies ▪ 5.3.5-P11: Construct sidewalks in industrial areas, with priority along streets served by existing and planned transit services. 5.4.2 Downtown Focus Area Goals and Policies ▪ 5.4.2-G4: Pedestrian and transit priority for mobility in the Downtown Focus Area ▪ 5.4.2-P10: Integrate established and new uses through pedestrian connections, streetscape, and complementary architecture and site design. 5.4.3 Santa Clara Station Focus Area Goals and Policies ▪ 5.4.3-G3: A link between the Santa Clara Station and a variety of transit options that offer viable transportation alternatives throughout the City and the region. ▪ 5.4.3-G4: Pedestrian and bicycle priority within the Santa Clara Station Focus Area with transit and vehicular priority to access the station. ▪ 5.4.3-P13: Provide new street, bicycle, and pedestrian networks that encourage visibility, accommodate multiple modes of travel and maximize connections, particularly through large sites and to the Downtown and Santa Clara University. ▪ 5.4.3-P14: Encourage alternative modes of travel to and from the Station, including biking, walking and shuttles. 5.8.1 General Mobility and Transportation Goals and Policies ▪ 5.8.1-G2: Transportation networks that provide a safe, efficient, convenient and integrated system to move people and goods. ▪ 5.8.1-G3: Transportation networks that promote a reduction in the use of personal vehicles and vehicle miles traveled. ▪ 5.8.1-P1: Create accessible transportation network systems to meet the needs of all segments of the population, including youth, seniors, persons with disabilities and low-income households. ▪ 5.8.1-P2: Link all City transportation networks, including pedestrian and bicycle circulation, to existing and planned regional networks. ▪ 5.8.1-P3: Identify opportunities to connect people to supportive services, public amenities and transportation. ▪ 5.8.1-P4: Expand transportation options and improve alternate modes that reduce greenhouse gas emissions. 5.8.2 Roadway Network Goals and Policies ▪ 5.8.2-G3: A roadway network designed to accommodate alternate transportation models in addition to vehicles.

Plan and Policies	Summary
	▪ 5.8.2-G4: Technological advances applied to the roadway infrastructure to maximize the use of the existing roadway and support efficient traffic flow. ▪ 5.8.2-P1: Require that new and retrofitted roadways implement "Full-Service Streets" standards, including minimal vehicular travel lane widths, pedestrian amenities, adequate sidewalks, street trees, bicycle facilities, transit facilities, lighting and signage, where feasible. ▪ 5.8.2-P8: Minimize disruption of traffic flow resulting from truck traffic and deliveries, particularly during commute hours. ▪ 5.8.2-P9: Require all new development to provide streets and sidewalks that meet City goals and standards, including new development in employment areas. ▪ 5.8.2-P11: Implement street standards that remove barriers and increase accessibility. ▪ 5.8.2-P12: Coordinate transportation planning with emergency service providers to ensure continued emergency service operations and services. 5.8.2 Transit Network Goals and Policies ▪ 5.8.2-G1: Transit services that are accessible to all segments of the City's population. ▪ 5.8.3-G2: A transit network that supports a reduction in automobile dependence for residents, employees and visitors. ▪ 5.8.3-G3: Transit options that are available to provide commuter services throughout the City. ▪ 5.8.3-P1: Support a coordinated regional transit system that circles the South Bay and the Peninsula including existing and planned Bay Area Rapid Transit (BART), Altamont Commuter Express (ACE), Caltrain, VTA and HSR facilities. ▪ 5.8.3-P2: Support continued and upgraded Caltrain, VTA, ACE, and Capitol Corridor transit facilities and services. ▪ 5.8.3-P5: Facilitate implementation of the transit system defined in the transit network classifications and illustrated on the Transit Network Diagram in Figure 5.7-2. ▪ 5.8.3-P6: Encourage additional multimodal transit centers and stops in order to provide convenient access to commuter rail, buses, shuttle and taxi services. ▪ 5.8.3-P7: Provide transit stops at safe, efficient and convenient locations to maximize ridership, including near employment centers, higher-density residential developments and Downtown. ▪ 5.8.3-P8: Require new development to include transit stop amenities, such as pedestrian pathways to stops, benches, travel information and shelters. ▪ 5.8.3-P12: Improve the existing public transit system and support expanded services to increase ridership. 5.8.4 Bicycle and Pedestrian Network Goals and Policies ▪ 5.8.4-P2 Provide a system of pedestrian and bicycle friendly facilities that supports the use of alternative travel modes and connects to activity centers as well as residential, office and mixed-use developments. ▪ 5.8.4-P5 Design streets to include detached sidewalks with planting strips or wider, attached sidewalks with tree-wells to encourage pedestrian use and safety, as well as to remove barriers and increase accessibility. ▪ 5.8.4-P6 Require new development to connect individual sites with existing and planned bicycle and pedestrian facilities, as well as with on-site and neighborhood amenities/services, to promote alternate modes of transportation. ▪ 5.8.4-P8 Require new development and public facilities to provide improvements, such as sidewalks, landscaping and bicycling facilities, to promote pedestrian and bicycle use.

Plan and Policies	Summary
	▪ 5.8.4-P9 Encourage pedestrian- and bicycle-oriented amenities, such as bicycle racks, benches, signalized mid-block crosswalks, and bus benches or enclosures. ▪ 5.8.4-P11 Provide pedestrian crossings that are well-marked using measures, such as audio/visual warnings, bulb-outs and median refuges, to improve safety. ▪ 5.8.4-P12 Include pedestrian and bicycle facilities when making improvements or modifications to railroad crossings, grade separations, interchanges and freeways. ▪ 5.8.4-P13 Promote pedestrian and bicycle safety through "best practices" or design guidelines for sidewalks, bicycle facilities, landscape strips and other buffers, as well as crosswalk design and placement. ▪ 5.8.4-P15 Work with school districts to implement a "Safe Routes to Schools" program to encourage children to walk to school. 5.8.5 Transportation Demand Management Goals and Policies ▪ 5.8.5-G1 Transportation demand management programs for all new development in order to decrease vehicle miles traveled and single occupant vehicle use. ▪ 5.8.5-P1 Require new development and City employees to implement transportation demand management programs that can include site-design measures, including preferred carpool and vanpool parking, enhanced pedestrian access, bicycle storage and recreational facilities. ▪ 5.8.5-P3 Encourage all new development to provide on-site bicycle facilities and pedestrian circulation. Air Quality Goals and Policies ▪ 5.10.2-P1 Support alternative transportation modes and efficient parking mechanisms to improve air quality. ▪ 5.10.2-P2 Encourage development patterns that reduce vehicle miles traveled and air pollution.
City of San Jose	
Envision: San José 2040 General Plan (2011)	The *Envision: San José 2040 General Plan* was adopted in November 2011. The plan includes strategies to achieve desired growth, while taking on a growing environmental and economic leadership role. The plan includes the following goals, policies, and actions are relevant to transportation: Goal LU-1 – General Land Use: Establish a land use pattern that fosters a more fiscally and environmentally sustainable, safe, and livable city. ▪ Policy LU-1.2: Encourage Walking. Create safe, attractive, and accessible pedestrian connections between developments and to public streets to minimize vehicular miles travels. ▪ Policy LU-1.3: Create safe, attractive, and accessible pedestrian connections between developments and to adjacent public streets to minimize vehicular miles traveled. Goal LU-3 – Downtown: Strengthen Downtown as a regional job, entertainment, and cultural destination and as the symbolic heart of San Jose. ▪ Policy LU-3.5: Balance the need for parking to support a thriving Downtown with the need to minimize the impacts of parking upon a vibrant pedestrian and transit oriented urban environment. Provide for the needs of bicyclists and pedestrians including adequate bicycle parking areas and design measures to promote bicyclist and pedestrian safety. Goal LU-9 – High-Quality Living Environments: Provide high quality living environments for San Jose's residents. ▪ Policy LU-9.1: Create a pedestrian-friendly environment by connecting new residential development with safe, convenient, accessible, and pleasant pedestrian facilities.

Plan and Policies	Summary
	Provide such connections between new development, its adjoining neighborhood, transit access points, schools, parks, and nearby commercial areas. Consistent with Transportation Policy TR-2.11, prohibit the development of new cul-de-sacs, unless it is the only feasible means of providing access to a property or properties, or gated communities, that do not provide through- and publicly-accessible bicycle and pedestrian connections. Goal TR-1 – Balanced Transportation System: Complete and maintain a multimodal transportation system that gives priority to the mobility needs of bicyclists, pedestrians, and public transit users while also providing for the safe and efficient movement of automobiles, buses, and trucks. ▪ Policy TR-1.1: Accommodate and encourage use of non-automobile transportation models to achieve San Jose's mobility goals and reduce vehicle trip generation and vehicle miles traveled (VMT). ▪ Policy TR-1.2: Consider impacts on overall mobility and all travel modes when evaluating transportation impacts of new developments or infrastructure projects. ▪ Policy TR-1.3 Increase substantially the proportion of commute travel using modes other than the single-occupant vehicle. […] ▪ Policy TR-1.5: Design, construct, operate, and maintain public streets to enable safe, comfortable, and attractive access and travel for motorists and for pedestrians, bicyclists, and transit users of all ages, abilities, and preferences. ▪ Policy TR-1.6: Require that public street improvements provide safe access for motorists and pedestrians along development frontages per current City design standards. ▪ Policy TR-1.7: Require that private streets be designed, constructed and maintained to provide safe, comfortable, and attractive access and travel for motorists and for pedestrians, bicyclists, and transit users of all ages, abilities, and preferences. ▪ Policy TR-1.8: Actively coordinate with regional transportation, land use planning, and transit agencies to develop a transportation network with complementary land uses that encourage travel by bicycling, walking and transit, and ensure that regional greenhouse gas emission standards are met. ▪ Policy TR-1.10: Require needed public street right-of-way dedication and improvements as development occurs. The ultimate right-of-way shall be no less than the dimensions as shown on the Functional Classification Diagram except when a lesser right-of-way will avoid significant social, neighborhood or environmental impacts and perform the same traffic movement function. Additional public street right-of-way, beyond that designated on the Functional Classification Diagram, may be required in specific locations to facilitate left-turn lanes, bus pullouts, and right-turn lanes in order to provide additional capacity at some intersections. ▪ Action TR-1.13: Reduce vehicle capacity on streets with projected excess capacity by reducing either the number of travel lanes or the roadway width, and use remaining public right-of-way to provide wider sidewalks, bicycle lanes, transit amenities, and/or landscaping. Establish criteria to identify roadways for capacity reduction (i.e., road diets) and conduct engineering studies and environmental review to determine implementation feasibility and develop implementation strategies. Goal TR-2 – Walking and Bicycling: Improve walking and bicycling facilities to be more convenient, comfortable, and safe, so that they become primary transportation modes in San Jose. ▪ Policy TR-2.2: Provide a continuous pedestrian and bicycle system to enhance connectivity throughout the City by completing missing segments. Eliminate or minimize physical obstacles and barriers that impede pedestrian and bicycle movement on City streets. Include consideration of grade-separated crossings at railroad tracks and

Plan and Policies	Summary
	freeways. Provide safe bicycle and pedestrian connections to all facilities regularly accessed by the public, including the Mineta San José International Airport. ▪ Policy TR-2.3: Construct crosswalks and sidewalks that are universally accessible and designed for use by people of all abilities. ▪ Policy TR-2.6: Require that all new traffic signal installations, existing traffic signal modifications, and projects included in San José's Capital Improvement Plan include installation of bicycle detection devices where appropriate and feasible. ▪ Policy TR-2.7: Give priority to pedestrian improvement projects that: improve pedestrian safety; improve pedestrian access to and within the Urban Villages and other growth areas; and that improve access to parks, schools, and transit facilities. ▪ Policy TR-2.8: Require new development where feasible to provide on-site facilities such as bicycle storage and showers, provide connections to existing and planned facilities, dedicate land to expand existing facilities or provide new facilities such as sidewalks and/or bicycle lanes/paths, or share in the cost of improvements. ▪ Policy TR-2.9: Coordinate and collaborate with the VTA, PCJPB, Amtrak, ACE, and local shuttle operators to permit bicyclists to transport bicycles and provide appropriate amenities on-board all commuter trains, buses, and shuttles. Coordinate with local transit operators to provide secure bicycle parking facilities at all park-and-ride lots, train stations, and major bus stops. ▪ Policy TR-2.10: Coordinate and collaborate with local School Districts to provide enhanced, safer bicycle and pedestrian connections to school facilities throughout San José. ▪ Policy TR-2.11: Prohibit the development of new cul-de-sacs, unless it is the only feasible means of providing access to a property or properties, or gated communities that do not provide through and publicly accessible bicycle and pedestrian connections. Pursue the development of new through bicycle and pedestrian connections in existing cul-de-sac areas where feasible. ▪ Policy TR-2.12: Consider alternative public right of way materials for roadway, sidewalks, park strips, crosswalks, and trails etc. to enhance the pedestrian and bicyclist experience as well as provide other benefits such as storm water management and hydro-modification control. ▪ Action TR-2.18: Provide bicycle storage facilities as identified in the San José Bicycle Master Plan. ▪ Action TR-2.20: Continue to participate in and support the recommendations of the Safe Routes to School program. As part of the on-going Safe Routes to School program, work with School Districts to increase the proportion of students who walk or bike to school by improving the safety of routes to school, by educating students and parents about the health and environmental benefits of walking and bicycling, and by creating incentives to encourage students to walk and bike. ▪ Action TR-2.21: Identify locations where traffic signal phases can be modified or added or where alternative intersection control can be utilized to enhance efficiency and safety for pedestrian service. Goal TR-3 – Maximize Use of Public Transit: Maximize use of existing and future public transportation services to increase ridership and decrease the use of private automobiles. ▪ Policy TR-3.1: Pursue development of Bus Rapid Transit (BRT), bus, shuttle, and fixed guideway (i.e., rail) services on designated streets and connections to major destinations. ▪ Policy TR-3.2: Ensure that roadways designated as Grand Boulevards adequately accommodate transit vehicle circulation and transit stops. Prioritize bus mobility along Stevens Creek Boulevard, The Alameda, and other heavily traveled transit corridors.

Plan and Policies	Summary
	▪ Policy TR-3.3: As part of the development review process, require that new development along existing and planned transit facilities consist of land use and development types and intensities that contribute toward transit ridership. In addition, require that new development is designed to accommodate and to provide direct access to transit facilities. ▪ Policy TR-3.4: Maintain and improve access to transit stops and stations for mobility challenged population groups such as youth, the disabled, and seniors. ▪ Action TR-3.6: Collaborate with Caltrans and VTA to prioritize transit mobility along the Grand Boulevards identified on the Growth Areas Diagram. Improvements could include installing transit signal priority, queue jump lanes at congested intersections, and/or exclusive bus lanes. ▪ Action TR-3.7: Regularly collaborate with BART to coordinate planning efforts for the proposed BART extension to San José/Santa Clara with appropriate land use designations and transportation connections. ▪ Action TR-3.8: Collaborate with transit providers to site transit stops at safe, efficient, and convenient locations, and to develop and provide transit stop amenities such as pedestrian pathways approaching stops, benches and shelters, nighttime lighting, traveler information systems, and bike storage to facilitate access to and from transit stops. ▪ Action TR-3.9: Ensure that all street improvements allow for easier and more efficient bus operations and improved passenger access and safety, while maintaining overall pedestrian and bicycle safety and convenience. Goal TR-4 – Passenger Rail Service: Provide maximum opportunities for upgrading passenger rail service for faster and more frequent trains, while making this improved service a positive asset to San Jose that is attractive, accessible, and safe. ▪ Policy TR-4.2: Work collaboratively with the California High-Speed Rail Authority to bring high speed rail to San José in a timely manner. ▪ Policy TR-4.4: Work cooperatively with the California High-Speed Rail Authority to ensure that rail corridors within the city are planned and constructed in a manner that enhances the character of the surrounding neighborhoods. ▪ Action TR-4.5: As appropriate, regularly coordinate with rail operators in San José on the following matters: o Maintenance of rail lines, landscaping, and easements. o Vehicle and pedestrian safety near at-grade rail crossings. o Rail electrification to increase the frequency of train service and reduce environmental impacts. o Grade separations (either above-ground or underground) to improve street connectivity and pedestrian and bicycle mobility at ground level. o The establishment of timed transfers with other transit providers in the area. o Analysis and mitigation of the potential negative impacts resulting from increased train service, corridor expansion, and the eventual upgrading of a rail line. Goal TR-5 – Vehicular Circulation: Maintain the City's street network to promote the safe and efficient movement of automobile and truck traffic while also providing for the safe and efficient movement of bicyclists, pedestrian, and transit vehicles. ▪ Policy TR-5.3: The minimum overall roadway performance during peak travel periods should be level of service "D" except for designated areas. How this policy is applied and exceptions to this policy are listed in the following bullets: o Vehicular Traffic Mitigation Measures. Review development proposals for their impacts on the level of service and require appropriate mitigation measures if development of the project has the potential to reduce the level of service to "E" or

Plan and Policies	Summary
	worse. These mitigation measures typically involve street improvements. Mitigation measures for vehicular traffic should not compromise or minimize community livability by removing mature street trees, significantly reducing front or side yards, or creating other adverse neighborhood impacts. ○ Downtown. In recognition of the unique position of the Downtown as the transit hub of Santa Clara County, and as the center for financial, business, institutional and cultural activities, development within the Downtown is exempted from traffic mitigation requirements. Intersections within and on the boundary of this area are also exempted from the level of service "D" performance criteria. ○ Special Strategy Areas. In recognition of the unique characteristics and particular goals of Special Strategy Areas, intersections identified as Protected Intersections within these areas, may be exempt from traffic mitigation requirements. Special Strategy Areas are identified in the City's adopted General Plan and include Urban Villages, Transit Station Areas, and Specific Plan Areas. ▪ Policy TR-5.5: Require that new development, which includes new public or private streets, connect these streets with the existing public street network and prohibit the gating of private streets with the intention of restricting public access. Furthermore, where possible, require that the street network within a given project consists of integrated short blocks to facilitate bicycle and pedestrian travel and access. Goal TR-6 – Goods Movement: Provide for safe and efficient movement of goods to support commerce and industry. ▪ Policy TR-6.1: Minimize potential conflicts between trucks and pedestrian, bicycle, transit, and vehicle access and circulation on streets with truck travel. ▪ Policy TR-6.2: Maintain primary freight routes that provide for direct access for goods movement to industrial and employment areas. ▪ Policy TR-6.6: Support the efficient and safe movement of goods by rail where appropriate and promote the continued operation of freight rail lines that serve industrial properties. Goal TR-9 – Tier I Reduction of VMT: Reduce VMT by 10 percent, from 2009 levels, as an interim goal. ▪ Policy TR-9.1: Enhance, expand and maintain facilities for walking and bicycling, particularly to connect with and ensure access to transit and to provide a safe and complete alternative transportation network that facilitates non-automobile trips. ▪ Action TR-1.13: Reduce vehicle capacity on streets with projected excess capacity by reducing either the number of travel lanes or the roadway width, and use remaining public right-of-way to provide wider sidewalks, bicycle lanes, transit amenities and/or landscaping. Establish criteria to identify roadways for capacity reduction (i.e. road diets) and conduct engineering studies to determine implementation feasibility and develop implementation strategies. ▪ Action: TR-3.5: Work with the VTA and other public transit providers to increase transit frequency and service along major corridors and to major destinations like Downtown and North San José. Goal TR-12 – Intelligent Transportation System (ITS): Develop a sustainable ITS system to effectively manage, operate, and maintain the current and future transportation network for all models of travel. A robust and efficient ITS system will provide added opportunities for reducing congestion and greenhouse gas emissions, and increasing safety and the quality of life for all users. ▪ Policy TR-12.2: Enhance the safety and effectiveness of transit service, bicycle, and pedestrian travel as alternative modes using advanced ITS systems. ▪ Action TR-12.4: Provide enhanced management of new, efficient streetlights for energy savings, sustainability, and safety along corridors and at intersections.

Plan and Policies	Summary
	▪ Action TR-12.8: Implement technology on select roadways (primary bikeways) to support bicycling as the preferred mode of transportation, such as advanced detection, signal priority timing, and public information kiosks. ▪ Action TR-12.9: Implement technology to aid pedestrians walking across intersections. Consider devices such as countdown timers and accessible pedestrian signals, which include audible and vibrating push buttons for disabled users.
Diridon Station Area Final Plan (2014)	The *Diridon Station Area Plan* was adopted in 2014. The Diridon Station Area Plan, 2014–2040 analyzes the expansion of the existing Diridon Station and the development of land uses within the 250-acre project boundary surrounding the station. The following goals and policies are relevant to the project: Connectivity Objective: ▪ Establish and strengthen connections to surrounding districts and within the planning area for pedestrians, bicyclists, and motorists, with emphasis on east-west connectivity across SR 87 and the rail corridor. Transportation Objective: ▪ Prioritize pedestrian circulation and transit. Improve pedestrian and bicycle connection to Guadalupe River from the area. Station Area Transportation Strategies: ▪ Facilitate pedestrian access and safety through pedestrian enhancements, including the provision of crosswalks at all intersections, wider sidewalks, and high quality pedestrian amenities along transit corridors ▪ Promote easy walking access from the station to commercial developments ▪ Encourage improved bicycle and trail connectivity and provide enhanced bicycle parking opportunities within the Station Area ▪ Ensure increased transit connectivity within and to/from the Station Area and provide for transit amenities at stops that improve the comfort and convenience for transit riders ▪ Promote the development of the Station Area's street and intersection network that supports the proposed intensification of land uses, while providing mobility for all travel modes and users Proposed Station Area Transportation Strategies: ▪ Walking o Promote walking connections from surrounding neighborhoods and employment centers to the Plan area by providing a continuous network of sidewalks, paseos, and pathways. o Facilitate pedestrian access and safety through pedestrian enhancements, including the installation of wider sidewalks along key pedestrian corridors. o Provide enhanced crosswalks at signalized intersections and key pedestrian crossings through the use of pedestrian bulb-outs, median refuge islands, and/or special paving treatments o Consider mid-block crosswalks and/or pedestrian signals at high-use uncontrolled crossings, as appropriate o Consider a pedestrian "scramble" signal phasing locations with high pedestrian volumes. o Enhance pedestrian underpass connections through installation of ramps, pedestrian-scale lighting, wider sidewalks, and public art. ▪ Bicycling o Provide a network of bicycle priority streets that provide linkages through the Plan area.

Plan and Policies	Summary
	○ Provide bicycle lanes (also known as Class II facilities) on streets with available right-of-way and higher traffic volumes. ○ Enhance the safety and comfort of the bicycle network through the use of colored bike lanes, "sharrow" markings, separated bike lands, signage, and/or other specialized treatments. ○ Develop trail connections along the Los Gatos Creek and Guadalupe River. ○ Where appropriate, provide grade-separated crossings along the Los Gatos Creek and Guadalupe River Trails to enhance connectivity and safety of the trail network. ○ Provide sufficient bicycle parking facilities for short-term and long-term purposes. ○ With the Station Area as its focus, promote usage of the existing bike share station and overall expansion of the program to encourage cycling as a primary mode and facilitate use of transit without having to transport a bicycle. ○ Support the expansion of Diridon Station's bicycle parking supply with the aim of creating a major bicycle parking facility, such as the 4th and King Bike Station in San Francisco. ▪ Transit ○ Enhance bus stops with appropriate amenities (shelters, benches, lighting, real-time passenger information) to improve the overall comfort and safety for transit riders. ○ Support rail transit operators (including VTA, Caltrain, ACE, Amtrak, and BART) to improve service and amenities that increase daily ridership and reduce potential negative effects on the community. ○ Consider implementing an additional shuttle route connecting Diridon Station and Mineta San Jose International Airport. ▪ Complete Streets ○ Improve the street grid system by creating new street connections and shorter blocks to promote additional travel options and reduce walking distances to destinations. ○ Provide adequate width for all sidewalk uses, including loading and unloading from on-street parking, walking traffic, window shopping traffic, bicycle parking, and street furniture. ○ Provide street trees to separate the pedestrian walkway from the bicycle and/or vehicle travel way, and to add identity and enhance the aesthetics of an area. ○ Provide pedestrian-scale lighting on key streets, crosswalks, and mid-block crossings. ○ Provide amenities such as pedestrian kiosks, benches, newspaper racks, trash cans, bus shelters, cafe tables, hanging flower baskets, and chairs to increase the number of opportunities for people to socialize and spend leisure time outdoors along public streets. ○ Incorporate "green street" features such as pervious surfaces, open channels, and vegetated drainage swales at appropriate locations. ○ Remove existing pork-chop islands to enhance public safety. ○ Provide continuous sidewalk improvements along major arterial streets. Close gaps between pedestrian connections. ▪ Parking Objective: ○ Disperse parking in different locations in the planning area and beyond to ensure easy walking access to destinations
San Jose Bike Plan 2020 (2009)	The City of San Jose prepared the San Jose Bike Plan 2020 in 2009. The Plan defines a network of bikeways that includes both on-street and off-street bikeways, and recommends policies, projects, and programs that encourage and facilitate bicycling within San Jose.

Plan and Policies	Summary
	This includes providing guidance for projects on the bikeway network, a regular maintenance program for bicycle facilities, recommendations on City policies regarding bicycle parking and supportive facilities (such as showers), and general policy guidance on facilitating bicycling.
City of Morgan Hill	
Morgan Hill 2035 General Plan (2016)	The *Morgan Hill 2035 General Plan* was adopted in July 2016 and establishes the overall policy framework for countywide land use and urban development. The following goals and policies are relevant to the project: **Circulation System and Complete Streets** Goal TR-1: A balanced, safe and efficient circulation system for all segments of the community, meeting local needs and accommodating projected regional and sub-regional traffic while protecting neighborhoods. ▪ Policy TR 1.1 System Efficiency: Plan, construct and maintain a coordinated and efficient system of local streets and highways throughout the community, meeting local needs and accommodating projected regional and subregional traffic while protecting neighborhoods from cut-through traffic. ▪ Policy TR 1.2 Highway 101 Widening: Plan for roadway system right-of-way based on the assumption that Highway 101 will be 8-lanes wide through the city by 2030. ▪ Policy TR 1.3 Transportation Safety: Implement strategies to ensure safe and appropriate operation of all components of the transportation system, such as programs to lower crash rates and reduce the number of transportation-related injuries in the city through education, enforcement, engineering strategies, physical improvements, and operational systems. Prioritize strategies that improve safety for students, pedestrians and bicyclists. Goal TR-2: A system designed for a healthy, active community based on complete streets, smart growth, and Sustainable Communities strategies; reflecting a balanced, safe, multi-modal transportation system for all users, especially in Downtown where pedestrian, bicycle, and transit facilities will be emphasized along with vehicular facilities. ▪ Policy TR 2.1 Multi-Model System for All Users: A balanced multi-modal system offers viable choices for residents, employees, customers, visitors, and recreational users. Use smart growth and Sustainable Communities principles throughout the city to provide a balanced transportation system which assures access to all, and which integrates all appropriate modes of transportation into an effectively functioning system, including such modes as auto, ride sharing, public rail and bus transit, bicycling and walking. ▪ Policy TR 2.2 Integrated Land Use/Transportation Planning: Integrate planning for land use and transportation development by ensuring that the timing, amount, and location of urban development is consistent with the development of the transportation system capacity. Promote environmental objectives that support smart growth and Sustainable Communities principles, such as safe and uncongested neighborhoods, a pedestrian-friendly vibrant downtown that emphasizes non-auto transportation modes, energy conservation, reduction of air and noise pollution, and the integrity of scenic and/or hillside areas. **Local Roadways and Level of Service** Goal TR-3: A coordinated, continuous network of streets and roads. ▪ Policy TR-3.4. As the LOS Policy and design criteria for roadway improvements, use a Tiered LOS Standard as follows: o LOS F in the Downtown at Main/Monterey, along Monterey Road between Main and Fifth Street, and along Depot Street at First through Fifth Streets [...]

Plan and Policies	Summary
	○ LOS D for intersections and segments elsewhere; except [for] LOS E for identified freeway ramps/zones, road segments and intersections that (1) provide a transition to and are located on the periphery of downtown; (2) are freeway zone intersections; and/or (3) where achieving LOS D could result in interim intersection improvements which would be "over-built" once the city's circulation network has been completed, and/or would involve unacceptable impacts on existing buildings or existing or planned transportation facilities including roads, sidewalks, bicycle and transit facilities; and/or would involve extraordinary costs to acquire land and existing buildings and build the improvement in relation to benefits achieved; and/or the facility would be widened beyond requirements to serve local traffic, in that the facility accommodates a significant component of peak hour sub-regional and regional through traffic. ○ In order to reduce the incentive for regional travel to be drawn off the freeway and onto local neighborhood streets, protect neighborhoods, avoid overbuilding intersections, and to create an incentive for using alternate modes of travel, LOS E during peak hours of travel is acceptable for the following identified freeway ramps, road segments and intersections: – Main Avenue and Del Monte Avenue – Main Avenue and Depot Street – Dunne Avenue and Del Monte Avenue – Dunne Avenue and Monterey Avenue – Dunne Avenue and Church Street; also until closed: Dunne Avenue and Depot Street – Cochrane Road and Monterey Road – Tennant Avenue and Monterey Road – Tennant Avenue and Butterfield Boulevard – Cochrane Road Freeway Zone: from Madrone Parkway/Cochrane Plaza to Cochrane/DePaul Drive – Dunne Avenue Freeway Zone: from Walnut Grove/East Dunne to Condit/East Dunne – Tennant Avenue Freeway Zone: from Butterfield/Tennant to Condit/Tennant – Freeway Ramps ▪ Policy TR3.5 Mitigation and Environmental Review Requirements: For roadway transportation facilities, when future traffic studies determine that an intersection, roadway segment, or freeway ramp/zone level of service will fall below its adopted standard, then the transportation studies will identify appropriate mitigation measures to ensure that the applicable level of service standard is attained. If a proposed traffic mitigation measure requires improvements for vehicular transportation that are beyond the jurisdiction of the City of Morgan Hill; and/or lead to an over-built intersection; and/or would have unacceptable impacts on existing buildings, or existing or planned transportation facilities and/or alternate modes of transportation, including roads, sidewalks, bicycle and transit facilities, the City may (but would not be required to) impose alternative mitigation measures that do not create the unacceptable impacts. [...] ▪ Policy TR-3.6 Unacceptable Impacts from Mitigation Measures: Measures. The types of impacts from identified vehicular traffic mitigation measures that may be determined by the City to be unacceptable include, but are not limited to the following: ○ Those that would encourage substantial neighborhood or community cut-through traffic;

Plan and Policies	Summary
	○ Those that would eliminate or reduce the width of a sidewalk below minimum City standard, where there is not sufficient planned public right-of-way to relocate the sidewalk; ○ Those that would eliminate a bicycle lane or reduce its width below City standard, where there is not sufficient planned public right-of-way to relocate the bicycle lane; ○ Those that would create unsafe pedestrian, bicycle, or vehicular operating conditions; ○ Those that would eliminate a bus stop or a parking lane that accommodates a bus stop, which cannot be relocated; ○ Those that would require acquisition of substantial existing buildings, and/or extraordinarily high cost of land acquisition, or an extraordinarily high project cost in relation to benefits achieved. ▪ Policy TR-3.7: Alternate Mitigation Measures and Conditions of Approval: Alternate mitigation measures and/or conditions of approval may include, but not be limited to making improvements to other facilities that assist with maintaining or improving projected levels of service, payment of an in-lieu fee to the City to be used to improve other components of the City's transportation system, developer installation of transportation improvements, and/or incorporation of physical features and operational programs into a project that support Trip Reduction/Travel Demand Management goals. ▪ Policy TR-3.8 Monitoring for Safety and Congestion: Improvements. While mitigation measures may not be required because level of service would not fall below an applicable LOS E or F standard, the City, developers, property owners, and others are not precluded from identifying and implementing improvements and strategies to improve level of service and reduce congestion. ▪ Policy TR-3.11 Arterial Roadways: Require the following streets to be built to arterial standards in the locations and at the number of lanes shown on the Circulation Element Map, and encourage the County to improve county arterial roadways to appropriate arterial standards in unincorporated areas. As described by the "Planned Transportation System (2030)" description of the major planned roads in this Circulation Element, the nature of the arterials will range from a 2-lane minor arterial, 2-lane major arterial, 2-lane multi-modal arterial, 4-lane or 6-lane major arterial, and 4-lane multi-modal arterial. North/South Arterial Roadways ○ Butterfield Boulevard (Cochrane Road to Monterey Road) ○ Hill/Peet Road Corridor (Cochrane Road to Tennant Avenue) ○ Monterey Road (the current 4-lane arterial may be narrowed to a 2-lane arterial) ○ Murphy Avenue/Mission View Drive Corridor (Cochrane Road to Maple Avenue) ○ Santa Teresa/Hale Corridor East/West Arterial Roadways ○ Cochrane Road (Monterey Road to Peet Road) ○ Dunne Avenue (Santa Teresa Corridor to Gallop Drive) ○ Edmundson Avenue (Santa Teresa Corridor to Monterey Road) ○ Main Avenue (Hale Avenue to Hill Road Corridor) ○ Madrone Parkway (west and east of Monterey Road) ○ Llagas Road Connection (Hale/Santa Teresa Corridor to Monterey/Old Monterey) ○ East Middle (Monterey Road to Murphy Avenue – outside City of Morgan Hill Sphere of Influence) ○ Tennant Avenue (Monterey Road to Hill Road) ○ Watsonville Road (connected to Butterfield Corridor)

Plan and Policies	Summary
	▪ Policy TR-3.12 Collector Roadways: Require the following streets to be built to collector standards in the locations designated on the Circulation Element Map, and encourage the County to improve these roadways to collector standards in unincorporated areas: o North/South Collector Roadways – Church Street (Dunne Avenue to Tennant Avenue) – Condit Road – Del Monte Street (Llagas Road to Wright Avenue, Dunne Avenue to Cosmo Avenue) – Depot Street – DeWitt Avenue (Dunne Avenue to Spring Avenue) – Foothill Avenue – La Alameda Drive – Murphy Avenue/Mission View Drive – Corridor (north of Cochrane Road) – Old Monterey Road (Llagas Road to Monterey Road) – Olive Avenue – Olympic Drive – Peak Avenue – Saddleback Drive – Serene Drive - East Lane – Sutter Boulevard – Trail Drive – Vista de Lomas Avenue – Walnut Grove Drive / Juan Hernandez (Tennant Avenue to Diana Avenue) o East/West Collector Roadways – Barrett Avenue (Juan Hernandez Drive to Butterfield Boulevard and Church Street to Monterey Road) – Burnett Avenue (Monterey Road to Vista de Lomas Avenue) – Central Avenue (Butterfield Boulevard to East Lane) – Cochrane Road (Peet Road to Malaguerra Drive) – Cosmo Avenue – Diana Avenue (Butterfield Boulevard to Laurel Road, Condit Road to Hill Road Corridor) – East Dunne Avenue (Gallop Drive to Jackson Oaks Drive) – West Dunne Avenue (Santa Teresa Corridor to DeWitt Avenue) – Fountain Oaks Drive – Half Road (Condit Road to Hill Road Corridor) – Hill Road (Tennant Avenue to Maple Avenue) – La Crosse Drive – Llagas Road (Old Monterey Road to Woodland Acres) – Main Avenue (Hale Avenue to Peak Avenue) – Native Dancer Drive – San Pedro Avenue (Spring Avenue Connector to Laurel Road, Condit Road to Hill Road)

Plan and Policies	Summary
	– Spring Avenue (Santa Teresa Corridor to San Pedro Avenue Connector) – Tennant Avenue (Hill Road to Foothill Avenue) – Vineyard Boulevard (La Crosse Drive to Tennant Avenue) – Wright Avenue (Monterey Road to Peak Avenue) ▪ Policy TR-3.18 Grade-Separated Railroad Crossings: Plan for the construction of grade-separated crossings of the Union Pacific railroad to improve emergency vehicle response times, and minimize conflicts between railroad trains and on-road vehicles. California Public Utilities Commission approval is required to modify an existing highway rail crossing or to construct a new crossing. Grade-separated crossings should be encouraged at Dunne Avenue (Depot Street to be re-routed through the existing Community and Cultural Center parking lot to create an intersection with Church Street either prior to or in conjunction with the grade separation project). ▪ Policy TR-3.19 Monterey Road Functionality: Give special consideration to the design of Monterey Road, balancing its functions as an arterial street, a "main street" accommodating downtown activities, and as an access road to the downtown and the major commercial areas of the city. Goal TR-4: Emphasis on transportation improvements in the Butterfield, Hale/Santa Teresa, and Monterey corridors. ▪ Policy TR-4.1 Right-of-Way for Butterfield Boulevard: Establish, maintain, and implement an adequate right-of-way for a major multi-modal arterial along Butterfield Boulevard, with four lanes extending from Cochrane Road to its connection with Watsonville Road at Monterey Road in the south end of town; and with two lanes extending north of Cochrane Road to connect with Madrone Parkway. ▪ Policy TR-4.2 Monterey Road Extension. Connect Monterey: Road to Butterfield Boulevard to the north end of town - generally in the vicinity of Cochrane Road at the north. Goal TR-5 Adequate off-street parking ▪ Policy TR-5.1 Adequate Parking Supply: Ensure that all developments provide adequate and convenient parking. In the Downtown, implement the Parking Resources Supply and Management Strategy in order to monitor and ensure provision of a public parking supply adequate to serve non-residential uses, with no on-site requirement for non-residential development. Continue to identify and implement policies and pricing strategies that encourage alternatives to single-occupant vehicle use. ▪ Policy TR-5.4 Long-Term On-Street Parking Prohibition: Prohibit long-term on-street parking in the industrial and commercial areas of the city. **Transit** Goal TR-6: A safe and efficient transit system that reduces congestion by providing viable non-automotive modes of transportation. ▪ Policy TR-6.4: Make existing and future commuter bus service convenient and accessible: Coordinate with the Monterey Road streetscape planning process to plan for and implement optimal locations for bus stops, shelters and turnouts in and near the Downtown area. ▪ Policy TR-6.7: Advanced Technologies. Use advanced technologies to enhance and improve transit safety and mobility. ▪ Policy TR-6.8: Transit for Changing Needs. Expand public transit as needed to meet the changing needs of the area for local and regional access, including methods such as bus, dial-a-ride, paratransit, and rail, where appropriate, for all users. Goal TR-7: Well-planned high-speed rail service that minimizes negative local impacts. ▪ Policy TR-7.3: Rail Crossings. The City recognizes that rail crossings are essential to provide connections from neighborhoods to destinations such as schools, parks, and

Plan and Policies	Summary
	services. The convenience of rail crossings should be balanced with the need to minimize safety and circulation impacts. ▪ Policy TR-7.4: Preferred Alignment. The City supports the alignment of high-speed rail along Highway 101 within the City of Morgan Hill, Placement of the high-speed rail alignment through downtown would be contrary to the City's vision and goals for its Downtown as expressed in the General Plan and Downtown Specific Plan. **Bikeways** Goal TR-8: A useable and comprehensive bikeway system that safety connects neighborhoods with workplaces and community destinations. ▪ Policy TR-8.8 Priorities for Bikeways Implementation: Where feasible, implement the bikeways system concurrent with adjacent development. Establish priorities for bikeways implementation based on improving safety and enhancing both commute and recreational cycling. These priorities shall be considered in directing resources and efforts to obtain funding for implementation. Priorities shall be regularly reviewed and updated as implementation proceeds. Current priorities for implementation of the bikeways plan include the following: o Live Oak High School Access o Little Llagas Creek Trail o Santa Teresa and Monterey Highway Corridor Improvements o East West Connection to Coyote Creek Trail **Pedestrian Network** Goal TR-9: Expanded pedestrian opportunities ▪ Policy TR-9.1: Private Development Connections. Ensure adequate pedestrian access in all developments, with special emphasis on pedestrian connections in the downtown area, in shopping areas, and major work centers, including sidewalks in industrial areas in accordance with the Trails and Natural Resources Master Plan. **Transportation Demand Management** Goal TR-10: A transportation system that incorporates strategies and technologies to manage traffic efficiently and reduce automotive vehicle trips.
City of Gilroy	
City of Gilroy 2002–2020 General Plan (2002)	The *City of Gilroy 2002-2020 General Plan* was adopted in June 2002. The following goals and policies are relevant to the project: **Traffic Circulation and Parking** GOAL: (a) A functional and balanced transportation system that provides access for all, is compatible with existing and proposed land uses, and minimizes emissions of air pollutants; (b) A coordinated multi-modal system that accommodates private motor vehicles, pedestrians, bicycles and mass transit. ▪ Policy 12.02 System Function and Neighborhood Protection. Ensure that the existing and proposed highways, streets, bikeways and pedestrian paths serve the functions they are intended to serve, while protecting the character of residential neighborhoods. ▪ Policy 12.08 Standard LOS. Maintain traffic conditions at LOS C or better at Gilroy intersections and roadways, allowing some commercial and industrial areas (as specified on the 'Level of Service D Areas' Map, page 6-11) to operate at LOS D or better. Exceptions to this standard will be allowed only where the City Council determines that the improvements needed to maintain the City's standard level of service at specific locations are infeasible. ▪ Policy 12.10 Land Use and Congestion. Promote land use planning that helps to reduce auto-mobile trips, thereby reducing congestion and helping to achieve air quality goals. In particular, strive for a balance of jobs and housing in future development to provide

Plan and Policies	Summary
	Gilroy residents the opportunity to work within Gilroy, and reduce long distance commuting both to and from Gilroy. [...] **Transit** GOAL: Local and regional public transit systems that are responsive to the changing needs of Gilroy area residents. ▪ Policy 13.03 Transit-Oriented Development: Encourage higher density residential and mixed use developments in close proximity to transit services, especially in the vicinity of the Downtown Caltrain station and multi-modal transit center. ▪ Policy 13.04 Regional Transit Services. Support regional transit operations that serve the Gilroy area through coordination of planning efforts and development policies that promote transit use. **Bicycle and Pedestrian Circulation** GOAL: Bicycling and walking as significant transportation modes, promoting personal health and recreational enjoyment while minimizing energy consumption and environmental degradation. ▪ Policy 14.02 Land Use Planning to Promote Walking and Biking: Promote compact, mixed use development patterns that encourage pedestrian and bicycle travel and transit use. For example, providing commercial services such as day care centers, restaurants, banks and stores near employment centers can reduce auto trips by promoting pedestrian travel. Providing neighborhood commercial and park uses within residential developments can reduce short auto trips by making pedestrian and bicycle trips feasible. Support implementation of the Neighborhood Districts, infill development, and mixed use development in the Downtown for their potential air quality benefits, as well as their other community benefits. ▪ Policy 14.03 Bicycle and Pedestrian Paths and Facilities. Correct deficiencies, expand existing facilities, and provide for the design of safer, convenient and attractive bicycle and pedestrian facilities whenever possible. Proposed roadways will be planned to accommodate bicycle traffic in accordance with the bikeway designations set forth in the City's Bicycle Transportation Plan. Similarly, greenbelts, linear parks, public easements and drainages reserved in public open space will be planned to accommodate bike and pedestrian traffic if they are so designated in the Bicycle Transportation Plan. ▪ Policy 14.04 Crossings. Design street crossings to provide for the safety needs of bicyclists and pedestrians. River and other crossings by bridges will be designed to accommodate bike lanes or paths in accordance with the designations set forth in the Bicycle Transportation Plan. Bridges for the exclusive use of pedestrians and bicycles should be considered whenever barriers exist which impede convenient and safe access. ▪ Action 14.A Trail and Pathway Implementation. Work with the County in implementing trails and bike paths planned locally as part of the County-wide network in the County Trails and Pathways Master Plan. New development along designated trail or bikeway corridors should be required to dedicate land and construct the designated facility. ▪ Action 14.I Bike Paths for Emergency Access. Design bike paths to be wide enough for emergency vehicles where other emergency routes do not exist, located and designed to enhance the personal safety of bicyclists. Use removable bollards or other devices to prevent vehicles other than emergency and maintenance vehicles from using the bike paths. ▪ Action 14.J Bikeway Planning and Design Criteria. Follow the criteria for bikeways outlined in the California Department of Transportation's publication Planning and Design Criteria for Bikeways in California.
City of Gilroy Bicycle/Pedestrian	The City of Gilroy published the Gilroy Bicycle/Pedestrian Transportation Plan in February 2002. The plan aims to facilitate programs that encourage bicycle ridership and pedestrian

Plan and Policies	Summary
Transportation Plan (2002)	activity, coordinate planning for bikeways and bicycle facilities with other modes of transportation, encourage multi-modal and multi-agency coordination, and provide a framework for incremental improvements to the bicycle and pedestrian networks in Gilroy. The plan includes the following policies relevant to transportation: Goal 5: Improve and promote bicycle access to public transportation facilities with bikeways and storage facilities. Objective: Reduce the conflict between bicycles and other modes of travel, and thereby decrease the number of collisions involving bicycles. Policies: System Continuity ▪ Plan a bikeway network to integrate with other City and regional bicycle routes and other modes of transportation (Park and Ride lots, transit facilities, train stations etc.) in order to encourage and support the use of bicycling and reduce the use of motor vehicles. ▪ Pan bicycle paths or lanes as part of new development and new roadway construction, consistent with provisions of this Plan and based on the bikeways map.
San Benito County	
San Benito County 2035 General Plan (2015)	San Benito County published the San Benito County 2035 General Plan in July 2015. The plan includes the following policies relevant to transportation: Section 6: Circulation Element Goal C-1: To provide an adequate road system that is safe, efficient, reliable, and within the County's ability to finance and maintain. ▪ C-1.1 Intermodal Connectivity: The County shall ensure that, whenever possible, roadway, highway, public transit systems, and pedestrian and bicycle trails are interconnected with other modes of transportation. Goal C-2: To provide a safe, continuous, and accessible system of facilities for bicycle and pedestrian travel in appropriate areas of the county. Goal C-3: To promote a safe and efficient public transit system that provides a viable travel alternative to automobiles, maximizes mobility, and reduces roadway congestion and greenhouse gas emissions. ▪ C-3.1 Transit-Supportive Land Use: The County shall encourage transit lines, stops, and facilities in locations where land uses and density would support transit use. ▪ C-3.2 Future Connections to High-Speed Rail: The County shall pursue potential opportunities to connect transit to future high-speed rail if a high-speed rail station is built in Gilroy and ensure that proposed connection alignments are carefully planned to maximize accessibility and minimize related environmental impacts associated with visual obstructions and noise, as appropriate. ▪ C-3.3 Connections to Gilroy Transit Center: The County shall encourage the use of shuttles/transit services at the Gilroy Transit Center to connect to appropriate and carefully planned locations that maximize use and minimize impacts to existing communities. The County shall also encourage the expansion of passenger rail between the Gilroy Caltrain Station and Hollister. ▪ C-3.9 Consistency with RTP: The County shall require all new development proposals to be consistent with and implement the San Benito County Regional Transportation Plan transit policies.
San Benito Regional Transportation Plan (2014)	The Council of San Benito County Government prepared a countywide regional transportation plan in June 2014. The plan includes the following policies relevant to transportation: Goal: Access and Mobility

Plan and Policies	Summary
	▪ Policy Objective: Provide convenient, accessible, and reliable travel options while maximizing productivity for all people and goods in the region. Goal: Economic Vitality ▪ Policy Objective: Raise the region's standard of living by enhancing the performance of the transportation system. Goal: Healthy Communities ▪ Policy Objective: Protect the health of our residents; foster efficient development patterns that optimize travel, housing, and employment choices and encourage active transportation. Goal: Social Equity ▪ Policy Objective: Provide an equitable level of transportation services to all segments of the population Goal: System Preservation and Safety ▪ Policy Objective: Preserve and ensure a sustainable and safe regional transportation system
Merced County	
2030 Merced County General Plan (2013)	Merced County adopted the 2030 Merced County General Plan in December 2013. The plan establishes the overall policy framework for countywide land use and urban development. In addition to the land use policies, the Merced County General Plan addresses transportation, housing, resource conversation, open space, health and safety, and noise. The plan includes the following policies relevant to transportation: ▪ Policy AG-2.16: High Speed Rail Line Location. Coordinate with the California High Speed Rail Authority to locate the high speed rail lines along existing major transportation corridors, such as SR 99 or 152, to minimize the conversion of productive agricultural land to non-agricultural uses. Transportation and Circulation Element Goal CIR-1: Maintain an efficient roadway system for the movement of people and goods that enhances the physical, economic, and social environment while being safe, efficient, and cost-effective. ▪ Policy CIR-1.3: Transportation Efficiency. Encourage transportation programs that result in more efficient energy use, reduce greenhouse gas emissions and noise levels, and improve air quality. ▪ Policy CIR-1.5: County Level of Service Standards. Implement a Countywide roadway system that achieves the following LOS standards during peak traffic periods: a) For roadways located within rural areas: LOS "C" or better. b) For roadways located outside Urban Communities that serve as connectors between Urban Communities: LOS of "D" or better. c) For roadways located within Urban Communities: LOS of "D" or better. ▪ Policy CIR-1.6: Level of Service "E" Exception. Allow a level of service "E" or worse only on a minor component of the circulation system (such as a left turn movement from a local roadway) if the major component of the circulation system (such as a through movement on a collector or arterial roadway) would be significantly compromised in the process of improving the level of service of the minor component. ▪ Policy CIR-1.21: Agricultural Operations. Require adequate right-of-way to accommodate increases in vehicular traffic on rural roads that serve agricultural tourism, value-added agriculture, and/or other unique agriculture-related land uses and pursue improvements as funding and resources allow.

Plan and Policies	Summary
	▪ Policy CIR-1.23: At-Grade Railroad Crossing Guidelines. Work with California Public Utilities Commission and the affected railroads to monitor the effects of development, and implement necessary and applicable design improvements at railroad crossings. Goal CIR-3: Maintain a public transit system that provides an alternative to automobile travel, supports ridesharing, and meets the needs of the entire community. ▪ Policy CIR-3.1: Multi-Modal Transportation. Encourage multi-modal transportation opportunities within Urban Communities. ▪ Policy CIR-3.2: Transit Improvements. Continue to support transit efforts by the Merced County Association of Governments, Dial-A-Ride, UC Merced Transit, other public entities, private social service providers, and other various private charter services to improve and expand public transit throughout the County. ▪ Policy CIR-3.8: New Transit Hubs. Identify and develop new regional transit hubs at major commercial centers, employers, or institutions. Goal CIR-4: Maintain and expand a safe, continuous, and easily accessible bicycle and pedestrian circulation system. Goal CIR-5: Maintain and expand a rail transportation system that provides safe, efficient, and reliable movement of freight and passengers within and through Merced County. ▪ Policy CIR-5.1: Freight and Passenger Rail Services. Support the continued operation and improvements to existing freight and passenger rail lines and terminals. ▪ Policy CIR-5.3: Rail Service Coordination. Encourage coordination of passenger rail services with other public transportation. ▪ Policy CIR-5.4: At-Grade Rail Crossing. Encourage alternatives to at-grade rail crossings at existing and future roads. ▪ Policy CIR-5.5: Railroad Corridor Preservation. Work with other agencies to plan railroad corridors that facilitate the preservation of important rail line right-of-way for future rail expansion or other appropriate transportation facilities. ▪ Policy CIR-5.7: High Speed Rail. Coordinate with the California High Speed Rail Authority, the cities, and other local agencies in efforts to properly locate the High Speed Rail corridors throughout Merced County, including at least one station and a heavy maintenance facility.
City of Los Banos 2030 General Plan Update (2009)	The *City of Los Banos 2030 General Plan Update* was adopted in 2009 and establishes the overall policy framework for citywide land use and urban development. The following goals and policies are relevant to the project: ▪ C-G-1 Promote safe and efficient vehicular circulation. ▪ C-G-6 Maintain acceptable levels of service (LOS) D and ensure that future development and the circulation system are in balance. ▪ C-G-14 Participate in the planning process for the California High-Speed Train.

Air Quality and Greenhouse Gases

Table 2 Regional and Local Plans and Policies Relevant to Air Quality and Greenhouse Gases

Plan and Policies	Summary
Regional	
Plan Bay Area 2040	The Association of Bay Area Governments and the Metropolitan Transportation Commission adopted Plan Bay Area 2040 as the Bay Area's long-term regional transportation and land use blueprint in 2017. The following goals and objectives are relevant to the project: ▪ Target #1: Reduce per-capita CO2 emissions from cars and light-duty trucks by **15%**. ▪ Target #3: Reduce adverse health impacts associated with air quality, road safety, and physical inactivity by 10%.
San Joaquin Valley Blueprint Planning Process Summary Report (2010)	The *San Joaquin Valley Blueprint Planning Process Summary Report* was prepared in 2010. The following goals and policies are relevant to the project: ▪ Principle 12: Support actions that encourage environmental resource management.
Moving Forward 2035 Monterey Bay (2017)	The Association of Monterey Bay Area Governments adopted *Moving Forward 2035 Monterey Bay* as the region's long-term regional transportation in 2014 and amended it in 2017. The following goals and objectives are relevant to the project: ▪ Policy 3: Environment – Promote environmental sustainability and protect the natural environment.
2014-2020 Regional Transportation Plan and Sustainable Communities Strategy for Merced County (2016)	The Merced County Association of Governments adopted *2014-2020 Regional Transportation Plan and Sustainable Communities Strategy for Merced County* as the County's long-term regional transportation in 2014 and amended it in 2016. The following goals and objectives are relevant to the project: ▪ 8.1. Coordinate transportation planning with air quality planning at the technical and policy level.
Santa Clara County	
Santa Clara County General Plan (1994)	The *Santa Clara County General Plan* was adopted in 1994. The following goals and policies are relevant to the project: ▪ Policy C-TR 11 Santa Clara County shall participate in updating and implementing the Congestion Management Plan, the provisions of which as set forth by law: a. establish priority for air quality goals and objectives and development of alternatives to automobile travel; and b. allow additional road capacity to be created only when all feasible automobile travel demand measures have been implemented. ▪ Policy C-RC 80 Sub-regional/countywide planning for Santa Clara County should place major emphasis on the inter-related goals, strategies and policies for improving energy efficiency in transportation, air quality, and reducing traffic congestion.

Plan and Policies	Summary
City of Santa Clara	
City of Santa Clara 2010–2035 General Plan (2010)	The *City of Santa Clara 2010–2035 General Plan* was adopted in November 2010. The following goals and policies are relevant to the project: ▪ 5.10.2-P1 Support alternative transportation modes and efficient parking mechanisms to improve air quality. ▪ 5.10.2-P2 Encourage development patterns that reduce vehicle miles traveled and air pollution. ▪ 5.10.2-P3 Encourage implementation of technological advances that minimize public health hazards and reduce the generation of air pollutants. ▪ 5.10.2-P4 Encourage measures to reduce greenhouse gas emissions to reach 30 percent below 1990 levels by 2020. ▪ 5.10.2-P6 Require "Best Management Practices" for construction dust abatement. ▪ 5.8.1-P4 Expand transportation options and improve alternate modes that reduce greenhouse gas emissions. ▪ 5.10.3-P15 Explore opportunities for alternative energy "fueling stations" and promote participation in shuttle services that use new technology vehicles to reduce greenhouse gas emissions.
City of San Jose	
Envision: San José 2040 General Plan (2011)	The *Envision: San José 2040 General Plan* was adopted in 2011. The following goals and policies are relevant to the project: ▪ MS-1.7 Encourage retrofits for existing buildings throughout San José to use green building principles in order to mitigate the environmental, economic, and social impact of those buildings, to achieve greenhouse gas reductions, and to improve air and water quality. ▪ MS-4.1 Promote the use of building materials that maintain healthful indoor air quality in an effort to reduce irritation and exposure to toxins and allergens for building occupants. ▪ MS-4.2 Encourage construction and pre-occupancy practices to improve indoor air quality upon occupancy of the structure. ▪ MS-10.1 Assess projected air emissions from new development in conformance with the Bay Area Air Quality Management District (BAAQMD) CEQA Guidelines and relative to state and federal standards. Identify and implement feasible air emission reduction measures. ▪ MS-10.2 Consider the cumulative air quality impacts from proposed developments for proposed land use designation changes and new development, consistent with the region's Clean Air Plan and State law. ▪ MS-10.3 Promote the expansion and improvement of public transportation services and facilities, where appropriate, to both encourage energy conservation and reduce air pollution. ▪ MS-10.4 Encourage effective regulation of mobile and stationary sources of air pollution, both inside and outside of San José. In particular, support Federal and State regulations to improve automobile emission controls. ▪ MS-10.7 Encourage regional and statewide air pollutant emission reduction through energy conservation to improve air quality.

Plan and Policies	Summary
	▪ MS-10.8 Minimize vegetation removal required for fire prevention. Require alternatives to discing, such as mowing, to the extent feasible. Where vegetation removal is required for property maintenance purposes, encourage alternatives that limit the exposure of bare soil. ▪ MS-10.9 Foster educational programs about air pollution problems and solutions. ▪ MS-11.2 For projects that emit toxic air contaminants, require project proponents to prepare health risk assessments in accordance with BAAQMD-recommended procedures as part of environmental review and employ effective mitigation to reduce possible health risks to a less than significant level. Alternatively, require new projects (such as, but not limited to, industrial, manufacturing, and processing facilities) that are sources of TACs to be located an adequate distance from residential areas and other sensitive receptors. ▪ MS-11.3 Review projects generating significant heavy duty truck traffic to designate truck routes that minimize exposure of sensitive receptors to TACs and particulate matter. ▪ MS-11.4 Encourage the installation of appropriate air filtration at existing schools, residences, and other sensitive receptor uses adversely affected by pollution sources. ▪ MS-11.5 Encourage the use of pollution absorbing trees and vegetation in buffer areas between substantial sources of TACs and sensitive land uses. ▪ MS-13.1 Include dust, particulate matter, and construction equipment exhaust control measures as conditions of approval for subdivision maps, site development and planned development permits, grading permits, and demolition permits. At minimum, conditions shall conform to construction mitigation measures recommended in the current BAAQMD CEQA Guidelines for the relevant project size and type. ▪ MS-13.2 Construction and/or demolition projects that have the potential to disturb asbestos (from soil or building material) shall comply with all the requirements of the California Air Resources Board's air toxics control measures (ATCMs) for Construction, Grading, Quarrying, and Surface Mining Operations. ▪ MS-13.3 Require subdivision designs and site planning to minimize grading and use landform grading in hillside areas. ▪ EC-7.7 Determine for any development or redevelopment site that is within 1,000 feet of a known, suspected, or likely geographic ultramafic rock unit (as identified in maps developed by the Department of Conservation – Division of Mines and Geology) or any other known or suspected locations of serpentine or naturally occurring asbestos, if naturally occurring asbestos exists and, if so, comply with the Bay Area Air Quality Management District's Asbestos Air Toxic Control Measure requirements. ▪ TR-1.8 Actively coordinate with regional transportation, land use planning, and transit agencies to develop a transportation network with complementary land uses that encourage travel by bicycling, walking and transit, and ensure that regional greenhouse gas emission standards are met.
Midtown Specific Plan (1992)	The *Midtown Specific Plan* was adopted in 1992. The following goals and policies are relevant to the project: ▪ Policy 4.3: Future development should incorporate energy-conserving devices to promote conservation.

Plan and Policies	Summary
Diridon Station Area Plan (2014)	The *Diridon Station Area Plan* was adopted in 2014. No goals and policies are directly relevant to the air quality or greenhouse gas analysis of the project.
Communications Hill Specific Plan (1992)	The *Communications Hill Specific Plan* was adopted in1992. The following goals and policies are relevant to the project: ▪ Minimize the potential adverse impacts of the Communications Hill area development on the immediate surrounding neighborhood.
City of Morgan Hill	
Morgan Hill 2035 General Plan (2016)	The *Morgan Hill 2035 General Plan* was adopted in 2016. The following goals and policies are relevant to the project: ▪ Policy NRE-10.1 Regional and Subregional Cooperation. Cooperate with regional agencies in developing and implementing air quality management plans. Support subregional coordination with other cities, counties, and agencies in the Santa Clara Valley and adjacent areas to address land use, jobs/housing balance, and transportation planning issues as a means of improving air quality. ▪ Policy NRE-10.2 State and Federal Regulation. Encourage effective regulation of mobile and stationary sources of air pollution and support State and federal regulations to improve automobile emission controls. ▪ Policy NRE-10.3 Automobile Emissions. Encourage the use of and infrastructure for alternative fuel, hybrid, and electric vehicles. Encourage new and existing public and private development to include electric vehicle charging stations. ▪ Policy NRE-10.4 Reduced Automobile Use. To reduce air pollution the frequency and length of automobile trips and the amount of traffic congestion by controlling sprawl, promoting infill development, and encouraging mixed uses and higher density development near transit. Support the expansion and improvement of alternative modes of transportation. Encourage development project designs that protect and improve air quality and minimize direct and indirect air pollutant emissions by including components that reduce vehicle trips. ▪ Policy NRE-11.2 TACs and Existing Sensitive Uses. Encourage the installation of appropriate air filtration mechanisms at existing schools, residences, and other sensitive receptors adversely affected by existing or proposed pollution sources. ▪ Policy NRE-11.3 Health Risk Assessments. For proposed development that emits toxic air contaminants, require project proponents to prepare health risk assessments in accordance with Bay Area Air Quality Management District procedures as part of environmental review and implement effective mitigation measures to reduce potential health risks to less-than-significant levels. Alternatively, require these projects to be located an adequate distance from residences and other sensitive receptors to avoid health risks. Consult with the Bay Area Air Quality Management District to identify stationary and mobile toxic air contaminant sources and determine the need for and requirements of a health risk assessment for proposed developments. ▪ Policy NRE-11.4 Truck Routes. For development projects generating significant heavy duty truck traffic, designate truck routes that minimize exposure of sensitive receptors to toxic air contaminants and particulate matter. ▪ Policy NRE-11.5 Truck Idling. For development projects generating significant truck traffic, require signage to remind drivers that the State truck idling law limits truck idling to five (5) minutes.

Plan and Policies	Summary
	▪ Policy NRE-11.5 Truck Idling. For development projects generating significant truck traffic, require signage to remind drivers that the State truck idling law limits truck idling to five (5) minutes. ▪ Policy NRE-11.6 Vegetation Buffers. Encourage the use of pollution-absorbing trees and vegetation in buffer areas between substantial sources of toxic air contaminants and sensitive receptors. ▪ Policy NRE-12.1 Best Practices. Requirement that development projects implement best management practices to reduce air pollutant emissions associated with construction and operation of the project. ▪ Policy NRE-12.2 Conditions of Approvals. Include dust, particulate matter, and construction equipment exhaust control measures as conditions of approval for subdivision maps, site development and planned development permits, grading permits, and demolition permits. At a minimum, conditions shall conform to construction mitigation measures recommended in the current Bay Area Air Quality Management District CEQA Guidelines. ▪ Policy NRE-12.3 Control Measures. Require construction and demolition projects that have the potential to disturb asbestos (from soil or building material) to comply with all the requirements of the California Air Resource Board's air toxics control measures (ATCMs) for Construction, Grading, Quarrying, and Surface Mining Operations. ▪ Policy NRE-12.4 Grading. Require subdivision designs and site planning to minimize grading and use landform grading in hillside areas. ▪ Policy NRE-15.1 Greenhouse Gas Emission Reduction Targets. Maintain a greenhouse gas reduction trajectory that is consistent with the greenhouse gas reduction targets of Executive Orders B-30-15 (40 percent below 1990 levels by 2030) and S-03-05 (80 percent below 1990 levels by 2050) to ensure the City is consistent with statewide efforts to reduce greenhouse gas emissions. ▪ Policy NRE-15.2 Linking Land Use and Transportation. Encourage land use and transportation patterns that reduce dependence on automobiles. ▪ Policy NRE-15.3 Climate Action Plan. Utilize policies in this General Plan denoted with the green leaf symbol as the City's greenhouse gas emissions reduction strategy. ▪ Policy NRE-15.4 Sustainable Land Use. Promote land use patterns that reduce the number and length of motor vehicle trips. ▪ Policy NRE-15.10 VMT Reduction. Continue to work with the Santa Clara Valley Transportation Authority on regional transportation solutions that will reduce vehicle miles traveled and greenhouse gas emissions.
City of Gilroy	
City of Gilroy 2002–2020 General Plan (2002)	The *City of Gilroy 2002–2020 General Plan* was adopted in 2002. The following goals and policies are relevant to the project: ▪ Policy 21.01 "Sensitive Receptors." Use land use planning and project siting to separate air pollution sources (such as freeways, arterials, industrial sites, etc.) from residential areas and other "sensitive receptors" (such as schools, hospital, and nursing homes) that would be adversely affected by close proximity to air pollutants. ▪ Policy 21.02 Landscaping to Reduce Pollutants. Promote the use of trees and plants in landscaping to reduce air pollutant levels. ▪ Policy 21.04 Regional Collaboration. Cooperate with the Bay Area Air Quality Management District and other agencies that deal with issues related to air quality (e.g., the Metropolitan Transportation Commission and the Association

Plan and Policies	Summary
	of Bay Area Governments) to develop and implement regional air quality strategies. Also, support subregional coordination with other cities, counties and agencies in Santa Clara Valley and adjacent areas to address land use, jobs/housing balance, and transportation planning issues as a means of improving air quality. ▪ Policy 21.05 Air Quality Impacts from Construction Activity. Reduce the air quality impacts associated with construction activity by reducing the exhaust emissions through appropriate mitigation actions. ▪ Policy 21.06 Traffic Control Measures. Implement the Transportation Control Measures recommended by the Bay Area Air Quality Management District in the 2000 Clean Air Plan to reduce pollutant emissions. ▪ Policy 12.09 LOS and Air Quality. Maintain the City's Standard Level of Service whenever feasible to minimize traffic congestion and thereby minimize exposure to carbon monoxide, since vehicles generate less air pollutant emissions at higher speed. ▪ Policy 14.01 Non-Auto Modes of Travel. Emphasize non-auto travel modes of transportation as a key strategy for achieving air quality goals. For example, encourage bicycle riding to school from an early age by providing safer bikeways between residential areas and schools and encourage the schools to provide secured bike racks and/or lockers.
Downtown Gilroy Specific Plan (2005)	The *Downtown Gilroy Specific Plan* was adopted in 2005. No goals and policies are directly relevant to the air quality or greenhouse gas analysis of the project.
San Benito County	
San Benito County 2035 General Plan (2015)	The *San Benito County 2035 General Plan* was adopted in 2015. The following goals and policies are relevant to the project: ▪ HS-5.1 New Development. The County shall use the CEQA process to ensure development projects incorporate feasible mitigation measures to reduce construction and operational air quality emissions, and consult with the Monterey Bay Unified Air Pollution Control District early in the development review process. ▪ HS-5.2 Sensitive Land Use Locations. The County shall ensure adequate distances between sensitive land uses and facilities or operations that may produce toxic or hazardous air pollutants or substantial odors. ▪ HS-5.3 Early Coordination with the Air Quality Control District. The County shall notify and coordinate with the Monterey Bay Unified Air Pollution Control District when industrial developments are proposed within the county to ensure applicants comply with applicable air quality regulations and incorporate design features and technologies to reduce air emissions. ▪ HS-5.4 PM10 Emissions from Construction. The County shall require developers to reduce particulate matter emissions from construction (e.g., grading, excavation, and demolition) consistent with standards established by the Monterey Bay Unified Air Pollution Control District. ▪ HS-5.6 New Construction Mitigation. The County shall work in coordination with the Monterey Bay Unified Air Pollution Control District to minimize air emissions from construction activities associated with proposed development. ▪ HS-5.7 Greenhouse Gas Emission Reductions. The County shall promote greenhouse gas emission reductions by supporting carbon efficient farming methods (e.g., methane capture systems, no-till farming, crop rotation, cover cropping); supporting the installation of renewable energy technologies; and

Plan and Policies	Summary
	protecting grasslands, open space, oak woodlands, riparian forest and farmlands from conversion to urban uses. ▪ HS-5.8 GHG Reduction Targets. The County acknowledges that the state endeavors to achieve 1990 greenhouse gas (GHG) emission levels, and establish a long-term goal to reduce GHG emissions by 80 percent below 1990 levels by 2050. The County will encourage projects that support these goals, recognizing that these goals can be met only if the state succeeds in decarbonizing its fuel supply. ▪ AD-2.5 Air Quality Management Coordination. The County shall continue to coordinate with the Monterey Bay Unified Air Pollution Control District (MBUAPCD) and affected agencies and neighboring jurisdictions in the North Central Coast Air Basin to ensure regional cooperation on cross-jurisdictional and regional transportation and air quality issues, and to establish parallel air quality programs and implementation measures. ▪ PFS-2.1 Efficient Operations. The County shall maintain facilities and service standards and conduct operations in a manner that meets community needs in an efficient manner, conserves resources, and reduces the County's contribution to greenhouse gas emissions.
Merced County	
2030 Merced County General Plan (2013)	The *2030 Merced County General Plan* was adopted in 2013. The following goals and policies are relevant to the project: ▪ Policy ED-1.7: Improving Merced County's Quality of Life (SO/PI). Economic development efforts shall include consideration of improving air quality, developing an educated workforce, promoting safe/crime-free communities, protecting water quality, and increasing recreational opportunities as a means to improve the quality of life for residents and workers and to attract new industries to the County. ▪ Policy LU-10.9: Air Quality Management Coordination (IGC). Coordinate with the San Joaquin Valley Air Pollution Control District and affected agencies and neighboring jurisdictions in the San Joaquin Valley Air Basin to ensure regional cooperation on cross-jurisdictional and regional transportation and air quality issues, and to establish parallel air quality programs and implementation measures, such as trip reduction ordinances and indirect source programs. ▪ Policy LU-10.10: San Joaquin Valley Air Pollution Control District Consultation (IGC). Consult with the San Joaquin Valley Air Pollution Control District during CEQA review for discretionary projects that have the potential for causing adverse air quality impacts. Ensure that development projects are submitted to the District for CEQA comments and review of air quality analysis. ▪ Policy CIR-1.3: Transportation Efficiency (RDR) Encourage transportation programs that result in more efficient energy use, reduce greenhouse gas emissions and noise levels, and improve air quality. ▪ Policy AQ-1.1: Energy Consumption Reduction (RDR) Encourage new residential, commercial, and industrial development to reduce air quality impacts from energy consumption. ▪ Policy AQ-1.6: Air Quality Improvement (SO) Support and implement programs to improve air quality throughout the County by reducing emissions related to vehicular travel and agricultural practices. ▪ Policy AQ-2.1: Air Quality Plan Compliance (RDR) Require all development projects to comply with applicable regional air quality plans and policies. ▪ Policy AQ-2.3: Cumulative Impacts (RDR). Encourage the reduction of cumulative air quality impacts produced by projects that are not significant by

Plan and Policies	Summary
	themselves, but result in cumulatively significant impacts in combination with other development. ▪ Policy AQ-2.4: Mitigation (RDR). Require that local and regional air quality impacts identified during CEQA review for projects reviewed and approved by the County are consistently and fairly mitigated. ▪ Policy AQ-2.5: Innovative Mitigation Measures (RDR, IGC, JP). Encourage innovative mitigation measures and project redesign to reduce air quality impacts by coordinating with the San Joaquin Valley Air Pollution Control District, project applicants, and other interested parties. ▪ Air Quality Element Goal AQ-3. Improve air quality through improved public facilities and operations and to serve as a model for the private sector. ▪ Policy AQ-4.6: Non-Motorized Transportation (RDR). Encourage non-motorized transportation corridors within and between communities. ▪ Policy AQ-4.7: Planning Integration (RDR). Require land use, transportation, and air quality planning to be integrated for the most efficient use of resources and a healthier environment. ▪ Policy AQ-5.1: Residential Buffers (RDR). Require effective buffers between residential and other sensitive land uses, and nonresidential land uses that generate hazardous air emissions such as highways (e.g., I-5 and SR-99), trucking centers, gasoline dispensing facilities, and dry cleaners. Effective buffers shall be determined by requiring consultation with the SJVAPCD for any project that may have a health risk impact, including those projects that would otherwise appear to be exempt from CEQA requirements.

Noise and Vibration

Table 3 Regional and Local Plans and Polices Relevant to Noise and Vibration

Plan/Policy Document	Summary
Santa Clara County	
Santa Clara County General Plan (1994)	The *Santa Clara County General Plan* was adopted in 1994 with amendments published in 2016. The general plan includes the following strategies, policies, and implementation recommendations relevant to noise and vibration: **Strategy 1: Prevent or Minimize Noise Conflicts** ▪ Policy C-HS 24: Environments for all residents of Santa Clara County free from noises that jeopardize their health and well-being should be provided through measures which promote noise and land use compatibility. ▪ Policy C-HS 25: Noise impacts from public and private projects should be mitigated. o Implementation C-HS(i) 24: Where necessary, construct sound walls or other noise mitigations. o Implementation C-HS(i) 25: Prohibit construction in areas which exceed applicable interior and exterior standards, unless suitable mitigation measures can be implemented.
Santa Clara County Ordinance Code (2016)	The Santa Clara Ordinance Code was originally adopted in 1972. The Code establishes the following sections of Division B11, Chapter VIII, Control of Noise and Vibration, relevant to noise and vibration:

Plan/Policy Document	Summary
	Section B11-152. – Exterior noise limits Maximum permissible sound levels by receiving land use: ▪ The noise standards for the various receiving land use categories as presented in [the following bullets, derived from Table B11-152] will apply to all property within any zoning district: o One and Two-Family Residential – 45 dBA between 10 pm to 7 am, and 55 dBA between 7 am to 10 pm; o Multiple Family Dwelling – 50 dBA between 10 pm and 7 am; o Residential Public Space – 55 dBA between 7 am to 10 pm; o Commercial – 60 dBA between 10 pm and 7 am, and 65 dBA between 7 am to 10 pm; o Light Industrial -- 70 dBA at all times; and o Heavy Industrial – 75 dBA at all times. ▪ No person may operate or cause to be operated any source of sound at any location within the unincorporated territory of the County or allow the creation of any noise on property owned, leased, occupied or otherwise controlled by the person, which causes the noise level when measured on any other property either incorporated or unincorporated, to exceed: a) The noise standard for that land use as specified [above] for a cumulative period of more than 30 minutes in any hour; or b) The noise standard plus five dB for a cumulative period of more than 15 minutes in any hour; or c) The noise standard plus ten dB for a cumulative period of more than five minutes in any hour; or d) The noise standard plus 15 dB for a cumulative period of more than one minute in any hour; or e) The noise standard plus 20 dB or the maximum measured ambient, for any period of time. **Sec. B11-153. - Interior noise standards** Maximum permissible dwelling interior sound levels: ▪ The interior noise standards for multifamily residential dwellings as presented in [the following bullet, derived from Table B11-153] will apply, unless otherwise specifically indicated, within all dwellings: o Multi-Family Dwelling – 35 dBA allowable interior noise level between 10 pm and 7 pm, and 45 dBA between 7 am and 10 pm. ▪ No person will operate or cause to be operated within a dwelling unit any source of sound or allow creation of any noise which causes the noise level when measured inside a neighboring receiving dwelling unit to exceed: a) The noise standard as specified [above] for a cumulative period of more than five minutes in any hour; or b) The noise standard plus five dB for a cumulative period of more than one minute in any hour; or c) The noise standard plus ten dB or the maximum measured ambient, for any period of time. ▪ If the measured ambient level exceeds that permissible within any of the noise limit categories above, the allowable noise exposure standard will be increased in five-dB increments in each category as appropriate to reflect the ambient noise level.

Plan/Policy Document	Summary
	Section B11-154. – Prohibited acts ▪ Construction/demolition a) Operating or causing the operation of any tools or equipment used in construction, drilling, repair, alteration or demolition work between weekdays and Saturday hours of 7 p.m. and 7 a.m., or at any time on Sundays or holidays, that the sound therefrom creates a noise disturbance across a residential or commercial real property line, except for emergency work of public service utilities or by variance. b) Where technically and economically feasible, construction activities will be conducted in a manner that the maximum noise levels at affected properties will not exceed those listed in the following schedule: i. Mobile equipment. Maximum noise levels for nonscheduled, intermittent, short-term operation (less than ten days) of mobile equipment: [See full ordinance for table of maximum noise levels] ii. Stationary equipment. Maximum noise levels for repetitively scheduled and relatively long-term operation (periods of ten days or more) of stationary equipment are as follows: [See full ordinance for table of maximum noise levels] ▪ Vibration a) Operating or permitting the operation of any device that creates a vibrating or quivering effect that: i. Endangers or injures the safety or health of human beings or animals; or ii. Annoys or disturbs a person of normal sensitivities; or iii. Endangers or injures personal or real properties.
City of Santa Clara	
City of Santa Clara 2010-2035 General Plan (2010)	The City of Santa Clara adopted the 2010-2035 General Plan on November 16, 2010. Updates were published in 2013 and 2014. The general plan includes the following environmental quality goals and policies which are applicable to noise and vibration: Goals ▪ 5.10.6-G1 Noise sources restricted to minimize impacts in the community. ▪ 5.10.6-G2 Sensitive uses protected from noise intrusion. Policies ▪ 5.10.6-P2 Incorporate noise attenuation measures for all projects that have noise exposure levels greater than General Plan “normally acceptable” levels. ▪ 5.10.6-P6 Discourage noise sensitive uses, such as residences, hospitals, schools, libraries and rest homes, from areas with high noise levels, and discourage high noise generating uses from areas adjacent to sensitive uses. ▪ 5.10.6-P10 Encourage transit agencies to develop and apply noise reduction technologies for their vehicles to reduce the noise and vibration impacts of Caltrain, Bay Area Rapid Transit, future High Speed Rail, light rail and bus traffic.
Santa Clara City Code (2017)	The Santa Clara City Code is current through Ordinance 1969, passed in 2017. Chapter 9.10, Regulation of Noise and Vibration, is relevant to noise and vibration: **9.10.040 Noise or sound regulation:** [. . .] The maximum noise or sound levels are set forth, as follows: ▪ Category 1: Single Family and Duplex Residential – 55 dBA between 7 am to 10 pm, and 50 dBA between 10 pm to 7 am;

Plan/Policy Document	Summary
	▪ Category 2: Multiple Family Residential – 55 dBA between 7 am to 10 pm; 50 dBA between 10 pm and 7 am; ▪ Category 3: Commercial, Office – 65 dBA between 7 am and 10 pm, and 60 dBA between 10 pm and 7 am; ▪ Light Industrial -- 70 dBA at all times; and ▪ Heavy Industrial – 75 dBA at all times. **9.10.050 Vibration regulation:** [. . .] Vibration [should not exceed] the vibration perception threshold of an individual at the closest property line point to the vibration source on the real property affected by the vibration.
City of San Jose	
Envision San Jose 2040 General Plan (2011)	The *Envision*: *San Jose 2040 General Plan* was adopted in 2011. The Plan establishes the following goals and policies relevant to noise and vibration: **Goal EC-1 – Community Noise Levels and Land Use Compatibility.** Minimize the impact of noise on people through noise reduction and suppression techniques, and through appropriate land use policies. ▪ **Policy EC-1.1:** Locate new development in areas where noise levels are appropriate for the proposed uses. Consider federal, state and City noise standards and guidelines as a part of new development review. **Interior Noise Levels** ▪ The City's standard for interior noise levels in residences, hotels, motels, residential care facilities, and hospitals is 45 dBA DNL. […] **Exterior Noise Levels** ▪ The City's acceptable exterior noise level objective is 60 dBA DNL or less for residential and most institutional land uses. The acceptable exterior noise level objective is established for the City, except in the environs of the San José International Airport and the Downtown, as described below: ▪ For new multi-family residential projects, the residential component of mixed-use development, [and single family residential uses] use a standard of 60 dBA DNL in usable outdoor activity areas [. . .] ▪ **Policy EC-1.2:** Minimize the noise impacts of new development on land uses sensitive to increased noise levels (Categories 1, 2, 3 and 6) by limiting noise generation and by requiring use of noise attenuation measures such as acoustical enclosures and sound barriers, where feasible. The City considers significant noise impacts to occur if a project would: ○ Cause the DNL at noise sensitive receptors to increase by five dBA DNL or more where the noise levels would remain "Normally Acceptable"; or ○ Cause the DNL at noise sensitive receptors to increase by three dBA DNL or more where noise levels would equal or exceed the "Normally Acceptable" level. ▪ **Policy EC-1.7:** Require construction operations within San José to use best available noise suppression devices and techniques and limit construction hours near residential uses per the City's Municipal Code. The City considers significant construction noise impacts to occur if a project located within 500 feet of residential uses or 200 feet of commercial or office uses would: ○ Involve substantial noise generating activities (such as building demolition, grading, excavation, pile driving, use of impact equipment, or building framing) continuing for more than 12 months. For such large or complex projects, a construction noise logistics plan that specifies hours of construction, noise and vibration minimization measures, posting or notification of construction schedules, and designation of a noise disturbance

Plan/Policy Document	Summary
	coordinator who would respond to neighborhood complaints will be required to be in place prior to the start of construction and implemented during construction to reduce noise impacts on neighboring residents and other uses. ▪ **Policy EC-1.9:** Require noise studies for land use proposals where known or suspected loud intermittent noise sources occur which may impact adjacent existing or planned land uses. For new residential development affected by noise from heavy rail, light rail, BART or other single-event noise sources, implement mitigation so that recurring maximum instantaneous noise levels do not exceed 50 dBA Lmax in bedrooms and 55 dBA Lmax in other rooms. **Goal EC-2 – Vibration. Minimize vibration impacts on people, residences, and business operations.** ▪ **Policy EC-2.1:** Near light and heavy rail lines or other sources of ground-borne vibration, minimize vibration impacts on people, residences, and businesses through the use of setbacks and/or structural design features that reduce vibration to levels at or below the guidelines of the Federal Transit Administration. Require new development within 100 feet of rail lines to demonstrate prior to project approval that vibration experienced by residents and vibration sensitive uses would not exceed these guidelines. ▪ **Policy EC-2.2:** Require new sources of ground-borne vibration, such as transit along fixed rail systems or the operation of impulsive equipment, to minimize vibration impacts on existing sensitive land uses to levels at or below the guidelines of the Federal Transit Administration. ▪ **Policy EC-2.3:** Require new development to minimize vibration impacts to adjacent uses during demolition and construction. For sensitive historic structures, a vibration limit of 0.08 in/sec PPV (peak particle velocity) will be used to minimize the potential for cosmetic damage to a building. A vibration limit of 0.20 in/sec PPV will be used to minimize the potential for cosmetic damage at buildings of normal conventional construction.
San Jose Municipal Code (2017)	The San Jose Municipal Code, codified through Ordinance No. 29912, was last adopted in May 2017. The Code includes the following titles and chapters relevant to noise and vibration: **Chapter 20.100: Administration and Permits** The City of San José does not establish quantitative noise limits for demolition or construction activities occurring in the City. According to San José Municipal Code, the legal hours of construction within 500 feet of a residential unit are limited to the hours of 7:00 a.m. to 7:00 p.m. on Monday through Friday. The City's Municipal Code also contains a Zoning Ordinance that limits noise levels generated by stand-by/backup and emergency generators. The noise level emitted by these generators shall not exceed 55 decibels at the property line of residential properties. The standards and criteria for stand-by/ backup generators are set as follows: ▪ Maximum noise levels, based upon a noise analysis by an acoustical engineer, will not exceed the applicable noise standards set forth in Title 20.80.2030. ▪ Testing of generators is limited to 7 a.m. to 7 p.m., Monday through Friday.
City of Morgan Hill	
Morgan Hill 2035 General Plan (2016)	The Morgan Hill 2035 General Plan was adopted in 2016. The Plan includes the following goals and policies relevant to noise and vibration: **Goal SSI-8. Prevention of noise from interfering with human activities or causing health problems Policies**

Plan/Policy Document	Summary
	▪ **Policy SSI-8.1: Exterior Noise Level Standards.** Require new development projects to be designed and constructed to meet acceptable exterior noise level standards, as follows: ○ Apply a maximum exterior noise level of 60 dBA Ldn in residential areas where outdoor use is a major consideration (e.g., backyards in single-family housing developments and recreation areas in multi-family housing projects). Where the City determines that providing an Ldn of 60 dBA or lower cannot be achieved after the application of reasonable and feasible mitigation, an Ldn of 65 dBA may be permitted. ○ Indoor noise levels should not exceed an Ldn of 45 dBA in new residential housing units. ○ Noise levels in new residential development exposed to an exterior Ldn 60 dBA or greater should be limited to a maximum instantaneous noise level (e.g., trucks on busy streets, train warning whistles) in bedrooms of 50 dBA. Maximum instantaneous noise levels in all other habitable rooms should not exceed 55 dBA. The maximum outdoor noise level for new residences near the railroad shall be 70 dBA Ldn, recognizing that train noise is characterized by relatively few loud events. ▪ **Policy SSI-8.3: Commercial and Industrial Noise Level Standards**. Evaluate interior noise levels in commercial and industrial structures on a case-by-case basis based on the use of the space. ▪ **Policy SSI-8.4: Office Noise Level Standards.** Interior noise levels in office buildings should be maintained at 45 dBA Leq (hourly average) or less, rather than 45 dBA Ldn (daily average). ▪ **Policy SSI-8.5: Traffic Noise Level Standards.** Consider noise level increases resulting from traffic associated with new projects significant if: a) the noise level increase is 5 dBA Ldn or greater, with a future noise level of less than 60 dBA Ldn, or b) the noise level increase is 3 dBA Ldn or greater, with a future noise level of 60 dBA Ldn or greater. ▪ **Policy SSI-8.6: Stationary Noise Level Standards.** Consider noise levels produced by stationary noise sources associated with new projects significant if they substantially exceed existing ambient noise levels. ▪ **Policy SSI-9.3: Sound Wall Design.** The maximum height of sound walls shall be eight feet [. . .]
Morgan Hill Municipal Code (2017)	The Morgan Hill Municipal Code was originally published in 1987. The current code is updated through Ordinance Number 2256 N.S., enacted June 28, 2017. The following sections from Chapter 8.28, Noise, of Title 8, Health and Safety, of the municipal code are applicable to noise and vibration: **8.28.040 - Enumeration of unlawful noises.** Unlawful noises include: **D.1. Construction activities as limited below**. "Construction activities" are defined as including but not limited to excavation, grading, paving, demolition, construction, alteration or repair of any building, site, street or highway, delivery or removal of construction material to a site, or movement of construction materials on a site. Construction activities are prohibited other than between the hours of seven a.m. and eight p.m., Monday through Friday and between the hours of nine a.m. to six p.m. on Saturday. Construction activities may not occur on Sundays or federal holidays. […] **I. Noises Adjacent to Schools, Courts, Churches and Hospitals**. The creation of any excessive noise on any street adjacent to any school, institution of learning, church or court while the same is in use or adjacent to any hospital, which noise

Plan/Policy Document	Summary
	unreasonably interferes with the workings of such institution or which disturbs or unduly annoys patients in the hospital; provided, conspicuous signs are displayed in such streets indicating that the street is adjacent to a school, hospital or court; **J. Pile Drivers, Hammers and Similar Equipment.** The operation, between the hours of eight p.m. and seven a.m. of any pile driver, steam shovel, pneumatic hammer, derrick, steam or electric hoist or other appliance, the use of which is attended by loud or unusual noise.
City of Gilroy	
The City of Gilroy 2002-2020 General Plan (2002)	The City of Gilroy 2002-2020 General Plan was adopted in 2002. The Plan includes the following goals and policies relevant to noise and vibration from Chapter 8, Community Resources and Potential Hazards. **GOAL:** Protection of Gilroy residents from exposure to excessive noise and its effects through appropriate mitigation measures and responsive land use planning, especially in regard to noise-sensitive land uses such as schools, hospitals, and housing for seniors. ▪ **Policy 26.02: Maximum Permissible Noise Levels.** Ensure that outdoor and indoor noise levels are within the maximum permitted levels (see Figure A- 27). ▪ **Policy 26.04: Acoustical Design.** Consider the acoustical design of projects in the development review process to reduce noise to an acceptable level. Ensure that noise mitigation features are designed and implemented in an aesthetically pleasing and consistent manner. ▪ **Policy 26.05: Earth Berms.** Require landscaped earth berms as an alternative to soundwalls where feasible to buffer noise along major thoroughfares adjacent to residential areas. Where an earth berm is not feasible, a masonry wall screened with drought tolerant, low maintenance landscaping should be required.
Gilroy Municipal Code (2017)	The Gilroy Municipal Code is current through Ordinance 2017-03, passed in 2017. The Code includes the following chapters relevant to noise and vibration. **Chapter 16, Offences—Miscellaneous** **Section 16.38 Hours of construction** of the Gilroy Municipal Code states the following regarding construction noise: (a) Unless otherwise provided for in a validly issued permit or approval, construction activities shall be limited to the hours of 7 a.m. and 7 p.m., Monday through Friday and 9 a.m. to 7 p.m. on Saturday. Construction activities shall not occur on Sundays or city holidays, which include: New Years Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day and Christmas. "Construction activities" are defined as including but not limited to, excavation, grading, paving, demolitions, construction, alteration or repair of any building, site, street or highway, delivery or removal of construction material to a site, or movement of construction materials on a site. […] **Chapter 30, Zoning Ordinance** **30.41.31 Specific provisions—Noise.** It shall be unlawful to generate noise within the city limits that exceeds the limits established in this section. (b) Maximum Outdoor Noise Levels. (2) Commercial and Industrial Noise Impacting Residentially Zoned Properties. Noise emanating from properties that are zoned for uses other than residential is limited to a maximum of 70 dBA (L10) measured at the

Plan/Policy Document	Summary
	residential property line. Such noise is limited to the hours of 7 a.m. to 10 p.m., and prohibited between the hours of 10 p.m. and 7 a.m.
San Benito County	
San Benito County 2035 General Plan (2015)	The San Benito County 2035 General Plan was adopted in 2015. The Plan includes the following goals and policies relevant to noise and vibration: **Health and Safety** **Goal HS-8:** To protect the health, safety, and welfare of county residents through the elimination of annoying or harmful noise levels. ▪ **Policy HS-8.1 Project Design.** The County shall require new development to comply with the noise standards shown in the tables in Figure A-29 through proper site and building design, such as building orientation, setbacks, barriers (e.g., earthen berms), and building construction practices. The County shall only consider the use of soundwalls after all design-related noise mitigation measures have been evaluated or integrated into the project or found infeasible. ▪ **Policy HS-8.2 Acoustical Analysis.** The County shall require an acoustical analysis to be performed prior to development approval where proposed land uses may produce or be exposed to noise levels exceeding the "normally acceptable" criteria (e.g. "conditionally acceptable", "normally unacceptable") shown in Table 9-2. Land uses should be prohibited from locating, or required to mitigate, in areas with a noise environment within the "unacceptable" range. ▪ **Policy HS-8.3 Construction Noise.** The County shall control the operation of construction equipment at specific sound intensities and frequencies during day time hours between 7 a.m. and 6 p.m. on weekdays and 8 a.m. and 5 p.m. on Saturdays. No construction shall be allowed on Sundays or federal holidays. ▪ **Policy HS-8.7 Acceptable Vibration Levels.** The County shall require construction projects anticipated to generate a significant amount of vibration to ensure acceptable interior vibration levels at nearby noise-sensitive uses based FTA criteria. ▪ **Policy HS-8.10 Reduction in Noise Levels at Existing Land Uses**. Reduce traffic noise levels where expected to significantly impact sensitive receptors through the installation of noise control measures such as quiet pavement surfaces, noise barriers, traffic calming measures, and interior sound insulation treatments. ▪ **Policy HS-8.12 Construction Noise Control Plans.** Require all construction projects to be constructed within 500 feet of sensitive receptors to develop and implement construction noise control plans that consider the following available controls in order to reduce construction noise levels as low as practical: ○ Utilize 'quiet' models of air compressors and other stationary noise sources where technology exists; ○ Equip all internal combustion engine-driven equipment with mufflers, which are in good condition and appropriate for the equipment; ○ Locate all stationary noise-generating equipment, such as air compressors and portable power generators, as far away as possible from adjacent land uses; ○ Locate staging areas and construction material areas as far away as possible from adjacent land uses; ○ Prohibit all unnecessary idling of internal combustion engines; ○ Notify all abutting land uses of the construction schedule in writing; and ○ Designate a "disturbance coordinator" (e.g. contractor foreman or authorized representative) who would be responsible for responding to any local complaints about construction noise. The disturbance coordinator will determine the cause of

Plan/Policy Document	Summary
	the noise complaint (e.g., starting too early, bad muffler, etc.) and will require that reasonable measures warranted to correct the problem be implemented. Conspicuously post a telephone number for the disturbance coordinator at the construction site and include it in the notice sent to neighbors regarding the construction schedule.
San Benito County Ordinance Code (2016)	The San Benito County Ordinance Code, codified through Ordinance 937, was most recently adopted in 2015. The Code includes Chapter 19.39, Noise Control Regulations, of Title 19, Land Use and Environmental Regulations, relevant to noise and vibration: **Article IV. Sound Level Restrictions** **19.39.030 MAXIMUM PERMISSIBLE SOUND PRESSURE LEVELS.** No person shall operate, or permit to be operated, on private property any source of sound in such a manner as to create: (A) A sound pressure level which exceeds the limits set forth for the receiving land use category in Table 1 [summarized in the following bullets] which may be measured at or within the real property boundary of the receiving land use, or its vertical extension: ▪ Rangeland, Productive Rural Lands, and Rural Transitional -- 45 dBA day and 35 dBA night ▪ Single Family Residential, Residential Multiple, and Planned Unit Development – 50 dBA day, 40 dBA night ▪ Commercial – 65 dBA day and 55 dBA night ▪ Controlled Manufacturing, Light Industrial, and Heavy Industrial – 70 dBA day and 60 dBA night (B) A sound pressure level which exceeds the limits set forth for the receiving land use category in Table A- 5 for more than 15 minutes in 60 minutes which may be measured at or within the real property boundary of the receiving land use, or its vertical extension; or (C) An equivalent A-weighted sound level that exceeds the limits set forth for the receiving land use category in Table A- 5 which may be measured at or within the real property boundary of the receiving land use or its vertical extension. (D) A sound level that exceeds the ambient sound level by 5 dB which may be measured at or within the real property boundary of the receiving land use or its vertical extension.
Frazier Lake Airpark Comprehensive Land Use Plan (2001)	The Frazier Lake Airpark Comprehensive Land Use Plan was adopted by the San Benito County Airport Land Use Commission in 2001. The following compatibility guidelines are relevant to noise and vibration: **4.3.1 Noise Compatibility:** The objective of noise compatibility criteria is to minimize the number of people exposed to frequent and/or high levels of aircraft noise. ▪ The maximum CNEL considered clearly acceptable for residential uses in the vicinity of the Airport is 55 dB CNEL. ▪ Noise level compatibility standards for other types of land uses shall be applied in the same manner as the above residential noise level criteria. Table 4-1 presents acceptable noise levels for other land uses in the vicinity of the Airport. ▪ Single-event noise levels should be considered when evaluating the compatibility of highly noise sensitive land uses such as schools, libraries, and outdoor theaters. Single-event noise levels are especially important in the areas regularly overflown by aircraft, but which do not produce significant CNEL contours.

Plan/Policy Document	Summary
Merced County	
2030 Merced County General Plan (2013)	The 2030 Merced County General Plan was adopted in 2013. The Plan includes the following goals and policies relevant to noise and vibration: **Public Facilities and Services** ▪ **Policy PFS-8.7: Incompatible Land Uses near Schools.** Coordinate with school districts to reduce the effects of incompatible land uses and noise adjacent to school facilities. **Health and Safety** **Goal HS-7:** Protect residents, employees, and visitors from the harmful and annoying effects of exposure to excessive noise. ▪ **Policy HS-7.4: New Noise or Groundborne Vibration Generating Uses.** Require new commercial and industrial uses to minimize encroachment on incompatible noise or groundborne vibration sensitive land uses. Also consider the potential for encroachment by residential and other noise or groundborne vibration sensitive land uses on adjacent lands that could significantly impact the viability of the commercial or industrial areas. ▪ **Policy HS-7.5: Noise Generating Activities.** Limit noise generating activities, such as construction, to hours of normal business operation. ▪ **Policy HS-7.9: Transportation Project Construction/Improvements.** Require transportation project proponents to prepare all acoustical analysis for all roadway and railway construction projects in accordance with Policy HS-7.2; additionally, rail projects shall require the preparation of a groundborne vibration analysis in accordance with Policy HS-7.2. Consider noise mitigation measures to reduce traffic and/or rail noise levels to comply with Table HS-1 standards if pre-project noise levels already exceed the noise standards of Table HS-1 and the increase is significant. The County defines a significant increase as follows: ○ Pre-Project Noise Environment of Less than 60 dB – 5+ dB would result in a significant increase ○ Pre-Project Noise Environment of between 60 - 65 dB – 3+ dB would result in a significant increase ○ Pre-Project Noise Environment greater than 65 dB – 1.5+ dB would result in a significant increase ▪ **Policy HS-7.11: Train Whistle Noise.** Support improvements to at-grade crossings in urban areas in order to eliminate the need for train whistle blasts near or within communities.
Merced County Ordinance Code (2016)	The Merced County Ordinance Code is current through Ordinance 1951, passed in 2017. The Code includes Chapter 10.60, Noise Control, of Title 10, Public Health and Safety, relevant to noise and vibration: **10.60.030 Sound level limitations.** A. No person shall cause, suffer, allow, or permit the operation of any sound source on private property in such a manner as to create a sound level that results in any of the following, when measured at or within the real property line of the receiving property: 1. Exceeds the background sound level by at least 10 dBA during daytime hours (7 a.m. to 10 p.m.) and by at least 5 dBA during nighttime hours (10 p.m. to 7 a.m.). The background sound level for purposes of this section shall be determined as set forth in Section 10.60.060; or

Plan/Policy Document	Summary
	2. Exceeds 65 dBA Ldn on residential real property or 70 dBA Ldn on nonresidential real property; or 3. Exceeds 75 dBA Lmax on residential real property or 80 dBA Lmax on nonresidential real property. B. The following are exempt from the sound level limits of Section 10.60.030(A): 5. Noise from construction activity, provided that all construction in or adjacent to urban areas shall be limited to the daytime hours between 7a.m. and 6 p.m., and all construction equipment shall be properly muffled and maintained.

CNEL = community noise equivalent level

Electromagnetic Fields and Electromagnetic Interference

Table 4 Regional and Local Plans and Policies Relevant to Electromagnetic Fields and Electromagnetic Interference

Plans and Policies	Summary
City of Santa Clara	
Santa Clara City Code, Title 12 Chapter 40 Sec 450	▪ This section of the Santa Clara City Code provides the following exception regarding underground utilities for facilities transmitting electric energy in excess of specified voltages and for mass transit conveyances: ▪ Poles, overhead wires, and associated overhead facilities used for the transmission of electric energy with potential difference of more than fifty thousand (50,000) volts or any overhead circuit with a current carrying capacity of four hundred (400) amperes or more at twelve thousand (12,000) volts line to line or direct current facilities used for mass transit conveyances shall be exempt from the provisions of this article.
City of Gilroy	
Gilroy City Code Chapter 30 Article XXXV Subsection 30.35.16.i 2016	▪ The Gilroy City Code includes a number of sections concerning RF EMF and EMI that relate to the HSR project: ▪ A plan for safety/security considerations, consistent with section 30.35.19 (Non-ionizing Electromagnetic Radiation or NIER exposure). A detailed description of the proposed measures to ensure that the public would be kept at a safe distance from any NIER transmission source associated with the proposed wireless communication facility, consistent with the NIER standards of the FCC or any potential future superseding standards, must be submitted as part of the application. The submitted plans must also show that the outer perimeter of the facility site (or NIER hazard zone in the case of rooftop antennas) will be posted with bilingual NIER hazard warning signage that also indicates the facility operator and an emergency contact. The emergency contact shall be someone available on a twenty-four (24) hour a day

Plans and Policies	Summary
	basis who is authorized by the applicant to act on behalf of the applicant regarding an emergency situation. For the protection of emergency response personnel, each wireless communication facility shall have an on-site emergency shut-off switch to de-energize all RF-related circuitry/componentry at the base station site (including a single shut-off switch for all facilities at a co-location site), or some other type of emergency shut-off by emergency personnel acceptable to the local fire chief, unless the applicant can prove that the FCC public exposure limits cannot be exceeded in the vicinity of the proposed facility, even if firefighters or other personnel work in close proximity to the antenna(s) or other RF radiation emitting devices/components
Subsection 30.36.17.f	▪ Compliance with FCC Rules. All telecommunication facilities shall comply at all times with all FCC rules, regulations, and standards
Subsection 30.35.19.a	▪ No telecommunication facility shall be located or operated in such a manner that it poses, either by itself or in combination with other such facilities, a potential threat to public health. To that end, no telecommunication facility or combination of facilities shall produce at any time power densities that exceed the FCC-adopted standard for human exposure, as amended, or any more restrictive standard subsequently adopted or promulgated by the city, county, the State of California, or the federal government
Subsection 30.35.19.b	▪ Initial compliance with this requirement shall be demonstrated for any facility through submission, at the time of application for the necessary permit or entitlement, of NIER (nonionizing electromagnetic radiation calculations) specifying NIER levels where the levels produced are projected to be highest. If these calculated NIER levels exceed eighty percent (80%) of the NIER standard established by this article, the applicant shall hire a qualified electrical engineer licensed by the State of California to measure NIER levels at said location after the facility is in operation. A report of these measurements and the findings with respect to compliance with the established NIER standard shall be submitted to the planning manager. NIER monitoring shall to be conducted utilizing the monitoring protocol described in section 30.35.11. Said facility shall not commence normal operations until it complies with this standard. Proof of said compliance shall be a certification provided by the engineer who prepared the original report. In order to assure the objectivity of the analysis, the city may require, at the applicant's expense, independent verification of the results of the analysis. Because of their intermittent nature, facilities solely for personal use, such as citizens band radio antenna or antenna operated by a federally licensed amateur radio operator as part of the amateur radio service, or for the incidental use of a co-located commercial activity, shall be required to comply with applicable FCC rules for NIER emissions, but they shall be routinely exempt from the submission requirements in this article
Subsection 30.35.19.c	▪ Within ninety (90) days of operation, every telecommunication facility and all broadcast radio and television facilities shall demonstrate continued compliance with the NIER standard established by this article. Every two (2) years a report listing each transmitter and antenna present at the facility and the effective radiated power radiated shall be submitted to the planning manager. If either the equipment or effective radiated power has changed, calculations specifying NIER levels where said levels are projected to be highest shall be prepared. NIER calculations shall also be prepared every time the adopted NIER standard changes. If calculated levels in either of these cases exceed eighty percent (80%) of the standard established by this article, the operator of the facility shall hire a qualified electrical engineer licensed by the State of California to measure the actual NIER levels produced. A report of these calculations, required measurements, if any, and the author's/engineer's findings with respect to compliance with the current NIER standard shall be submitted to the planning manager within ninety (90) days of facility approval and every two (2) years

Plans and Policies	Summary
	thereafter. In the case of a change in the standard, the required report shall be submitted within ninety (90) days of the date said change becomes effective
San Benito County	
San Benito County Code of Ordinances 7.11	▪ The San Benito County Code of Ordinances, passed in 2013, includes the following relevant electromagnetic policies: o 7.11.001: To provide a uniform and comprehensive set of standards for the orderly development, operation and maintenance of wireless telecommunications facilities consistent with applicable federal standards. The standards contained in this chapter are designed to promote public health, safety and welfare and the aesthetic quality of the county as forth in the policies of the general plan. It is also the intent of the county to provide the community with the benefits of this technology without unduly restricting service providers. o 7.11.012: Wireless communications facilities operating alone and in conjunction with other telecommunications facilities shall not generate electromagnetic frequency (EMF) radiation in excess of the guidelines for permissible human exposure to EMF as adopted by the Federal Communications Commission (FCC).
Merced County	
2030 Merced County General Plan (2013)	Merced County adopted the *2030 Merced County General Plan* on December 10, 2013. The general plan includes the following policies: ▪ Policy PFS-5.4: Require mitigation of electrical interference to adjacent land uses in the placement of electrical and other transmission facilities. ▪ Policy PFS-5.7: Coordinate with local gas and electric utility companies in the design and location, and appropriate expansion, of gas and electric systems, while minimizing impacts to agriculture and minimizing noise, electromagnetic, visual, and other impacts on residents.
City of Los Banos	
Los Banos Municipal Code, Title 9, Chapter 3, Article 21	The Los Banos Municipal Code includes the following relevant electromagnetic policy: ▪ Any device which radiates radio frequency energy shall be so operated as not to cause interference with any activity carried on beyond the boundary line of the property upon which the device is located. No radiation of any kind shall be emitted which is dangerous to human beings. (§ 5.25, Ord. 342, as amended by § 182, Ord. 1095, eff. November 20, 2010)

Sources: Merced County 2013a.
ANSI = American National Standards Institute

Public Utilities and Energy

Table 5 Regional and Local Plans and Policies Relevant to Public Utilities and Energy

Plan/Policy Document	Summary
Regional	
Plan Bay Area (2017)	▪ The Association of Bay Area Governments (ABAG) and the Metropolitan Transportation Commission (MTC) adopted Plan Bay Area 2040 on July 26, 2017 as the Bay Area's long-term regional transportation plan and sustainable communities strategy. The document includes the following goals relevant to public utilities and energy: ▪ Target #9a: Increase non-auto mode share by 10 percentage points (to 26 percent of trips). ▪ Climate Initiatives Program. Invest in strategies that reduce transportation-related emissions and vehicle miles traveled and encourage the use of cleaner fuels.
Santa Clara County	
Santa Clara County General Plan (1994)	The *Santa Clara County General Plan* was adopted in 1994. The general plan includes the following goals relevant to public utilities and energy: ▪ Strategy #1: Reduce Transportation Energy Demand and Oil-Dependency o C-RC 79: Energy use and fossil fuel dependency in the transportation sector should be reduced by the following general means: a) Growth management policies and implementation to minimize increases in the extent of the urbanized area and to promote balanced, compact urban development; b) Land use and development standards which support alternative transportation modes; c) Travel demand management and transportation system operational efficiency; expanded transit service; d) Increased availability and use of alternative fuels. o C-RC 80: Sub-regional/countywide planning for Santa Clara County should place major emphasis on the inter-related goals, strategies and policies for improving energy efficiency in transportation, air quality, and reducing traffic congestion. ▪ Strategy #2: Conserve Energy in Residential and Other Sectors o C-RC 81: Energy conservation in existing buildings and homes, particularly those pre-dating adoption of energy-efficiency building code standards, should be improved and encouraged. o C-RC 82: Alternatives to non-renewable energy sources should be encouraged and implemented in the design of new buildings and incorporated in the redesign and reconstruction of older buildings. o C-RC 83: Industrial and agricultural processes should be modified wherever feasible to take advantage of energy savings, to reduce operational costs, and to enhance competitiveness. ▪ Strategy #3: Increase Consumer and General Public Awareness Through Education o C-RC 84: Countywide efforts to promote energy efficiency and conservation awareness should be continued and coordinated through public utilities, community organizations, the educational system, industries, and government. Direction and assistance of local gas and electric utilities should be sought in the development of education programs.

Plan/Policy Document	Summary
Santa Clara Valley Water District 2015 Urban Water Management Plan (2016)	The State of California set a goal of reducing urban water use by 20 percent with adoption of the Water Conservation Act of 2009 (SB X7-7). Retail urban water suppliers are required to determine baseline water use during their baseline period and also target water use for the years 2015 and 2020 in order to help achieve the statewide 20 percent reduction. The *Santa Clara Valley Water District 2015 Urban Water Management Plan* established the following policies to support the state goal: ▪ Policy E-2.1.5: "Maximize water use efficiency, water conservation and demand management opportunities" including BMPs or DMMs. ▪ Water Supply Objective 2.1.1 "…maintain and develop groundwater to optimize reliability…" and in consideration of water shortage management objectives established in the Plan.
Santa Clara County Countywide Integrated Waste Management Plan (1995)	The *Santa Clara County Countywide Integrated Waste Management Plan* was adopted in November 1995. The following goals, objectives, and policies are relevant to public utilities and energy: ▪ Goal #1: The highest priority shall be given to the prevention of waste, and secondary priority to the recycling, composting, and transformation of waste materials. Materials which cannot be recycled or composted shall be landfilled in an environmentally safe and effective manner. New technologies in integrated waste management techniques shall be evaluated and the use of effective methods and technologies shall be encouraged. ▪ Goal #5: Efforts shall be made to reduce the amount and hazard of special wastes generated to maximize recycling, reuse, and composting of special waste generated in the County, and to ensure environmentally safe disposal of the special waste generated which cannot be reused, recycled, or composted. ▪ Objective #1: The Cities and the County will implement an integrated waste management system designated to divert a percentage of the waste stream from landfill disposal. Specifically, the combined jurisdictions of the county will divert at least 25 percent of the 1990 base year materials by 1995, and 50 percent by the year 2000.
City of Santa Clara	
City of Santa Clara General Plan (2014)	The City of Santa Clara adopted the *City of Santa Clara General Plan Housing Element and Land Use Policies* in December 2014. The following policies are relevant to public utilities and energy: ▪ Prerequisite Goal 5.1.1-G 3: Adequate planning and implementation of infrastructure, services, amenities and public facilities for new neighborhoods and intensified development. ▪ Prerequisite Goal 5.1.1-G 4: Development of a multimodal transportation system that reduces the reliance on owning and driving single-occupant vehicles. ▪ Prerequisite Goal 5.1.1-G 5: A balanced community in terms of jobs, housing, supporting infrastructure and public services. ▪ Policy 5.1.1-P 18: Prior to 2023, evaluate the potential effects of climate change trends and identify any available mechanisms to address sea level rise, if any. ▪ Conservation Goal 5.10.1-G 3: Adequate solid waste disposal capacity through effective programs for recycling and composting. ▪ Conservation Goal 5.10.1-G 4: Adequate wastewater treatment and conveyance capacities. ▪ Energy Goal 5.10.3-G 3: Adequate energy service to residents, businesses, and municipal operations.

Plan/Policy Document	Summary
	▪ Water Goal 5.10.4-G 1: A reliable, safe supply of potable water adequate to meet present and future needs.
City of Santa Clara Climate Action Plan (2013)	The City of Santa Clara adopted the *City of Santa Clara Climate Action Plan* in 2013. The Climate Action Plan supports the statewide goal of reducing GHG emissions to 1990 levels by 2020. The Climate Action Plan establishes the following goals and policies relevant to public utilities and energy: ▪ Goal: Maximize the efficient use of energy throughout the community. ▪ Goal: Reduce GHG-intensive water use practices. ▪ Goal: Establish land uses and transportation options that minimize single-occupant vehicle use.

City of Santa Clara Municipal Code (2003, 2017)	The Santa Clara Municipal Code was adopted in 2003, with the most recent update made in 2017. The code includes the following policies relevant to public utilities and energy:
	▪ Title 5, Business Licenses and Regulation, Chapter 5.20.180 Removal or relocation of facilities: Utilities shall remove or relocate without expense to the City any facilities installed, used, or maintained under the franchise when made necessary by any lawful change of grade, alignment, or width of any public street, way, alley, or place, including the construction for or by the City of any subway or viaduct or any other lawful public work of governmental character.
	▪ Title 12, Streets, Sidewalks, and Public Places, Chapter 12.25 Excavation and Use of City Rights-of-Way: An encroachment permit shall be required of any person seeking to use or make cuts, openings or excavations in or under the surface of any public right-of-way or City easement for the repair, installation, removal, or construction of any pipe, conduit, duct, tunnel, vault, wire, cable, utility structure, utility cabinet, or for any other purpose.
	▪ Title 13, Public Services, Chapter 13.05 Operation of an Electric Utility: Under the City Charter the City of Santa Clara owns and operates an electric utility which has the objectives of:
	  ○ Acquire and/or generate electric power;
	  ○ Arrange for the transmission and distribution of such power;
	  ○ Operate and maintain equipment and facilities necessary to provide electric services.

City of San Jose	
Envision San Jose 2040 General Plan (2011)	The City of San Jose adopted the *Envision San Jose 2040 General Plan* in 2011. The following goals are relevant to public utilities and energy: ▪ Goal MS-2: Energy Conservation and Renewable Energy Use—Maximize the use of green building practices in new and existing development to maximize energy efficiency and conservation and to maximize the use of renewable energy sources. ▪ Goal IN-1.10: Require undergrounding of all new publicly owned utility lines. Encourage undergrounding of all privately owned utility lines in new developments. Work with electricity and telecommunications providers to underground existing overhead lines. ▪ Goal CD-1.27: When approving new construction, require the undergrounding of distribution utility lines serving the development. Encourage programs for undergrounding existing overhead distribution lines. Overhead lines providing electrical power to light rail transit vehicles and high tension electrical transmission lines are exempt from this policy.

Plan/Policy Document	Summary
2015 Urban Water Management Plan, San Jose Municipal Water System (2016)	The San Jose Municipal Water System adopted the Urban Water Management Plan in 2016. The plan includes the following Groundwater Basin Management Objectives relevant to public utilities and energy: ▪ Manage groundwater in conjunction with surface water through direct and in-lieu recharge programs to sustain groundwater supplies and to minimize saltwater intrusion and land subsidence. ▪ Implement programs to protect or promote groundwater quality to support beneficial uses. ▪ Work with regulatory and land use agencies to protect recharge areas, promote natural recharge, and prevent groundwater contamination.
San Jose Municipal Code, Title 15, Public Utilities (2018)	The City of San Jose Municipal Code was adopted in 2010 with the most recent update made in 2018. The code establishes the following policies relevant to public utilities and energy: Chapter 15.08 - Municipal Water System ▪ The city will endeavor to supply water dependably and safely in adequate quantities to meet the reasonable needs and requirements of customers. It cannot, however, guarantee complete freedom from interruption. Chapter 15.10 - Water Waste Prevention and Water Shortage Measures ▪ 15.10.200 - Water waste prevention: (A) The regulations in this part are intended to be permanent water conservation measures and to apply to the use of water from all sources on an on-going basis; (B) No person shall waste water from any source nor shall any person allow such water wastage; (C) No person shall use any water from any source, or continue the use of any water from any source, in any way prohibited. ▪ 15.10.260 – Building and construction: No person shall use, permit, or allow the use of potable water for building or construction purposes, such as consolidation of backfill or dust control, without a prior approved written exception from the city.
City of Morgan Hill	
Morgan Hill General Plan (2016)	The City of Morgan Hill adopted the *Morgan Hill General Plan* in 2016. The plan includes the following goals and policies relevant to public utilities and energy: ▪ GOAL NRE -16 Conservation of energy resources. ▪ Policy NRE -15.3 Climate Action Plan. Utilize policies in this General Plan as the City's GHG emissions reduction strategy.
City of Morgan Hill Municipal Code Title 13 (2018)	The City of Morgan Hill Municipal Code was adopted in 2010, with the most recent update made in 2018. The code includes the following policies relevant to public utilities and energy: ▪ Title 13, Public Services ○ Chapter 13.30 - Urban Storm Water Quality Management and Discharge Control includes Chapter 13.30.100 - Prohibition of discharges from industrial or commercial activity. ○ Illegal discharges from industrial/commercial sources into the storm drain system is prohibited unless permitted under a separate NPDES permit or as allowed by BMPs approved by the city public works department. Such discharges include water, cleansers, or solvents from the cleaning of vehicles, machinery or equipment, and other such commercial and industrial operations.

Plan/Policy Document	Summary
City of Morgan Hill Urban Water Management Plan 2015 (2016)	The City of Morgan Hill adopted the Urban Water Management Plan in 2016. The plan includes the following Groundwater Basin Management Objectives relevant to public utilities and energy: ▪ Water suppliers must submit an Urban Water Management Plan to the Department of Water Resources in accordance with California Water Code requirements. The purpose of the Urban Water Management Plan is to implement and maintain the reliability of urban water supplies, ensure that future beneficial use can be complemented by sufficient water supply, continue to promote policies and programs that benefit water conservation, and provide a means for response during water supply shortages and drought conditions. ▪ BMO 1: Groundwater supplies are managed to optimize water supply reliability and minimize land subsidence. ▪ BMO 2: Groundwater is protected from existing and potential contamination, including salt water intrusion.
City of Gilroy	
City of Gilroy General Plan (2002)	The City of Gilroy adopted the General Plan in 2002. The plan includes the following goals and policies relevant to public utilities and energy: ▪ Policy 19.09 - Storm Drain System. Provide and maintain a system of storm drains to protect areas of development from localized flooding. ▪ Policy 19.11 - Undergrounding. Encourage the undergrounding of utilities in older areas, especially when an area is undergoing extensive redevelopment or significant construction. Continue to require the undergrounding of utilities in areas of new development. ▪ Policy 19.01 - Resource Limits. Work with the Santa Clara Valley Water District to ensure that water demand created by new development does not exceed the groundwater supply that can be economically and legally withdrawn from the aquifer on a sustained basis. Restrict groundwater pumping to rates that will not impair groundwater quality or create other environmental damage, such as subsidence. ▪ Policy 19.03 - Sewer, Treatment, and Disposal Capacities. Provide and maintain adequate sewers, wastewater treatment, and treated water disposal capacities to meet the needs of future growth (residential, industrial, and other). ▪ Policy 19.06 - Sewer Connections. Require that new development connect to the City's principal wastewater treatment plant. Require pre-treatment of wastes if necessary, and continue to discourage the development of package treatment plants.
Gilroy Economic Development Strategic Plan (2014)	The City of Gilroy adopted the *Gilroy Economic Development Strategic Plan* on February 19, 2014. The plan includes the following goal relevant to public utilities and energy: ▪ Goal 6: Utilize Key Infrastructure To Support Economic Development Opportunities. The City is incorporating planning for the proposed high-speed rail facility in the New General Plan. High Speed Rail and other projects also provide the potential to add new conduit and fiber through the planning and construction of new infrastructure.

Plan/Policy Document	Summary
Gilroy Strategic Plan 2015→2020→2030 (2015)	The City of Gilroy adopted the *Gilroy Strategic Plan* in March 2015. The plan includes the following goals relevant to public utilities and energy: ▪ Principle 7 - Green City – Environmentally Friendly ○ Item 4. Conserving water resources ○ Item 5. Expanded recycled water system in the City ○ Item 6. Reduced City government and community carbon footprint
City of Gilroy Municipal Code (2018)	The City of Gilroy Municipal Code was adopted in 1969 with the most recent update in 2018. The code includes the following policies relevant to public utilities and energy: ▪ Chapter 19, Sewers and Sewage Disposal § 19.9 Plans, design standards and inspection of sewerage construction ○ Plans for sewerage construction shall meet all design requirements of the Standard Details, Public Works Department Manual and shall also meet the design requirements as established from time to time by the director of public works. ▪ Chapter 26A, Underground Utility Districts § 26A.8 Responsibility of utility companies ○ If underground construction is necessary to provide utility service within a district created by any resolution adopted pursuant to section 26A.3 hereof, the supplying utility shall furnish that portion of the conduits, conductors and associated equipment required to be furnished by it under its applicable rules, regulations and tariffs on file with the commission (Ord. No. 831, § 1, 10-21-68). ▪ Chapter 27A, Water Resources Protection—Guidelines and Standards § 27A.3 Applicability. ○ Regulations for stream protection apply to all properties within a streamside review area. Streamside development is subject to review for applicability of the "Guidelines and Standards for Land Use Near Streams" ratified by the Water Resource Protection Collaborative (2007-11, § 4-16-07). ▪ Chapter 27C, Municipal Storm Water Quality Protection and Discharge Control § 27C.8 Prohibition of discharges from industrial or commercial activity. ○ Illegal discharges from industrial/commercial sources into the storm drain system is prohibited unless permitted under a separate NPDES permit or as allowed by BMPs approved by the city public works department. Such discharges include water, cleansers, or solvents from the cleaning of vehicles, machinery or equipment, and other such commercial and industrial operations.
City of Gilroy Urban Water Management Plan (2016)	The Final Draft of the Urban Water Management Plan for the City of Gilroy was published in May 2016. The purpose of this plan is to implement and maintain the reliability of urban water supplies, ensure that future beneficial use can be complemented by sufficient water supply, continue to promote policies and programs that benefit water conservation, and provide a means for response during water supply shortages and drought conditions. The plan establishes water use targets including a 2020 Urban Water Use Target to reduce water use by 20 percent from the 5-year average per capita water use.

Plan/Policy Document	Summary
San Benito County	
San Benito County 2035 General Plan (2015)	San Benito County adopted the *San Benito County 2035 General Plan* on July 21, 2015. The plan includes the following goals and policies relevant to public utilities and energy: ▪ GOAL PFS -8: To ensure that all areas of the County are provided with gas and electric service and residents and businesses can connect renewable energy facilities to the electric grid. ▪ GOAL NCR -6: To increase energy independence and reduce greenhouse gas emissions through the use of renewable energy sources and improved energy conservation and efficiency.
San Benito County Code of Ordinances (2018)	The San Benito County Code of Ordinances was adopted in 1969 with the most recent update made in 2018. The code includes the following policies relevant to public utilities and energy: ▪ Chapter 15.03. UNDERGROUND UTILITY DISTRICTS § 15.03.026 Responsibility Of Utility Companies o If underground construction is necessary to provide utility service within a district created by any resolution adopted pursuant to § 15.03.021 of this chapter, the supplying utility shall furnish that portion of the conduits, conductors and associated equipment required to be furnished by it under its applicable rules, regulations and tariffs on file with the Commission. ▪ Chapter 15.05. WATER § 15.05.004 Permit Required For Extraction Of Groundwater For Use Off-Parcel o In the unincorporated areas of the county, it is unlawful to extract groundwater of any nature or description, or for a property owner to allow the extraction for the purpose of using the water or selling the water for any use on other than a parcel of land within the sub-basin as described in the San Benito County Water District Annual Groundwater Report upon which the extraction occurs, provided such use does not exceed the safe yield of the sub-basin, without first obtaining a permit. ▪ Chapter 15.05. § 15.05.005 Permit Required For Injection Of Imported Water Into Groundwater Basins Or Aquifers o It is unlawful to inject native surface water or imported water of any nature or description or for a property owner to allow the injection, into a groundwater aquifer without first obtaining a permit.
2015 Hollister Urban Area Urban Water Management Plan (2016)	The Hollister Urban Area covered by the 2015 Urban Water Management Plan is an approximately 20 square mile area comprising all of the incorporated, and some unincorporated county lands, surrounding the City of Hollister. The plan includes the following Groundwater Basin Management Objective relevant to public utilities and energy: ▪ Implement Water Shortage Contingency Plan to reduce water demand by more than 25 percent to meet the state mandated water use reduction, including Demand Management Measures.

Plan/Policy Document	Summary
Merced County	
2030 Merced County General Plan (2013)	Merced County adopted the *2030 Merced County General Plan* on December 10, 2013. The plan includes the following goals and policies relevant to public utilities and energy: ▪ Goal PFS-1: Ensure adequate funding for new, expanded, and upgraded public facilities and services. ▪ Policy PFS-1.1: Determine the acceptable minimum level for the efficient delivery and funding of essential County services. ▪ Goal W-2: Ensure the adequate wastewater collection, treatment, and disposal within the County. ▪ Goal PFS-3: Ensure the management of stormwater in a safe and environmentally sensitive manner through the provisions of adequate storm drainage facilities that protect people, property, and the environment. ▪ Goal PFS-4: Ensure the safe and efficient disposal and recycling of solid and hazardous waste generated in the County. ▪ Goal PFS-5: Ensure the provision of adequate utilities to the residents of Merced County. ▪ Policy PFS-5.1: Encourage the provision of adequate gas and electric, communications, and telecommunications service and facilities to serve the needs of existing and future residents and businesses. ▪ Policy PFS-5.3: Encourage new transmission and distribution lines to be sited within existing utility easements and right-of-ways or utilize joint-use of easements among different utilities to avoid impacting existing communities. ▪ Policy PFS-5.4: Require mitigation of electrical interference to adjacent land uses in the placement of electrical and other transmission facilities. ▪ Policy PFS-5.6: Require power transmission and distribution facilities to be located underground within urban communities and residential centers. ▪ Policy PFS-5.7: Coordinate with local gas and electric utility companies in the design and location, and appropriate expansion of gas and electric systems, while minimizing impacts to agriculture and minimizing noise, electromagnetic, visual, and other impacts on residents. ▪ Goal NR-2: Provide adequate and efficient energy supplies by increasing renewable energy production and energy conservation. ▪ Policy NR-2.1: Promote the development and use of renewable energy resources to reduce dependency on petroleum-based energy sources. ▪ Policy NR-2.2: Encourage new electricity providers to use only clean alternative energy sources (e.g., solar, thermal, wind).
Merced Integrated Regional Water Management Plan (2013)	Merced County adopted the *Merced Integrated Regional Water Management Plan* in November 2013. The plan includes the following objectives relevant to public utilities and energy: ▪ Objective B: Meet demands for all uses, including agriculture, urban, and environmental resource needs. ▪ Objective E: Maximize water use efficiency.

Plan/Policy Document	Summary
Merced County Storm Water Management Program (2007)	Merced County adopted the *Merced County Storm Water Management Program* in April 2007. The program includes the following objectives relevant to public utilities and energy: ▪ Objective: Detect and eliminate illicit discharges to the storm sewer system. ▪ Objective: Reduce pollutants in storm water runoff from construction sites. ▪ Objective: Reduce pollutants in post-construction storm water runoff from new and redevelopment.
City of Los Banos	
City of Los Banos 2030 General Plan Update (2009)	The City of Los Banos adopted the *Los Banos 2030 General Plan Update* in 2009. The plan includes the following policy relevant to public utilities and energy: ▪ POSR-I-42 Support federal and State efforts to reduce greenhouse gasses and emissions through local action that will reduce motor vehicle use, support alternative forms of transportation, require energy conservation in new construction, and energy management in public buildings.

Biological and Aquatic Resources

Table 6 Regional and Local Plans and Policies Relevant to Biological and Aquatic Resources

Policy Title	Summary
Santa Clara County	
Santa Clara County General Plan, 1995-2010 and *General Plan Updates* (County of Santa Clara 1994, 2015)	The Santa Clara County General Plan addresses biological resources under the Habitat & Biodiversity section of the Resource Conservation Chapter. The general plan policies are framed under four organizing strategies. Each strategy and the policies relevant to the project extent are as follows: ▪ Strategy 1: Improve Current Knowledge and Awareness of Habitats and Natural Areas *[No applicable policies]* ▪ Strategy 2: Protect the Biological Integrity of Critical Habitat Areas ▪ Policy C-RC 30: Habitat and other resource areas not suitable or intended for urbanization should be excluded from urbanization, and non-urban development which occurs within resource conservation areas should minimize impacts upon habitat and biodiversity. ▪ Policy C-RC 32: Land uses permitted in resource conservation areas should not be allowed to degrade the integrity of natural habitat. ▪ Policy C-RC 33: Linkages and corridors between habitat areas should be provided to allow for migration and otherwise compensate for the effects of habitat fragmentation.

Policy Title	Summary
	▪ Strategy 3: Encourage Habitat Restoration Areas *[No applicable policies]* ▪ Strategy 4: Evaluate Effectiveness of Environmental Mitigations ▪ Policy C-RC 36: Specific project mitigations for the purpose of preserving habitat should be monitored for a period of time to assure the likelihood of their effectiveness. The Santa Clara County General Plan addresses historical and specimen trees (protected trees) under the Heritage Resources section of the Resource Conservation Chapter. The general plan policies are framed under three basic strategies, but only one strategy and one policy apply to biological resources (protected trees). The strategy and policy relevant to protected trees in the project extent are as follows: ▪ Strategy 2: Prevent or Minimize Adverse Impacts on Heritage Resources ▪ Policy C-RC 52: Prevention of unnecessary losses to heritage resources should be ensured as much as possible through adequate ordinances, regulations, and standard review procedures. Mitigation efforts, such as relocation of the resource, should be employed where feasible when projects will have significant adverse impact upon heritage resources. The Santa Clara County General Plan also addresses biological resources under the Resource Conservation chapter of Part 3 of the General Plan in Book B, which addresses Rural Unincorporated Area Issues & Policies. ▪ Policy R-RC 43: Large scale grading and clearing of land should not be allowed if it will significantly degrade valuable habitat or impair surface water quality. ▪ Policy R-RC 47: Impacts from new development on woodland habitats should be minimized by encouraging: a. clustering of development to avoid critical habitat areas, where clustering is permitted; b. inclusion of important habitat within open space areas for project requiring open space dedication; c. siting and design of roads, utility corridors and other infrastructure to avoid fragmentation of habitat; and d. acquisition or avoidance of critical habitat areas. ▪ Policy R-RC 51: Preservation of habitat linkages and migration corridors should be encouraged where needed to allow for species migration, prevent species isolation, and otherwise compensate for the effects of habitat fragmentation. ▪ Policy R-RC 52: For rural area development proposals subject to open space dedication requirements and adjacent to other open space lands, the County shall encourage project design which maximizes the contiguity of undeveloped, open space areas, reducing fragmentation of habitat. ▪ Implementation R-RC(i) 17: Utilize updated mapping and information on natural areas and habitats to identify and assess the potential need for maintaining migration corridors and habitat linkages. The Santa Clara County General Plan also addresses land uses relevant to biological resources under the Land Use chapter of Part 3 of the General Plan in Book B, which addresses Rural Unincorporated Area Issues & Policies.

Policy Title	Summary
	▪ Policy R-LU 28: For all uses allowed in Hillsides areas other than agricultural and single-family residential land uses, open space preservation by means of easement dedication may be required in order to: a. protect the public health, safety and general welfare; b. prevent or mitigate potentially significant adverse environmental impacts; and/or c. to create perimeter areas that adequately buffer neighboring properties from adverse off-site impacts of the proposed land use. ▪ Policy R-LU 79: New public transportation facilities shall be compatible with the land uses in the areas in which they are located and consistent with the County's General Plan.
Santa Clara County Code of Ordinances, Title C—Construction, Development and Land Use, Division C16, Tree Preservation and Removal (Santa Clara County Code & Municipal Code Corporation, 1998–2006)	This code of ordinance for tree preservation and removal states that the county preservation of all trees in private and public property is necessary to provide habitat to a variety of wildlife species. The Santa Clara County Municipal Code regulates the protection, maintenance, removal and planting of trees, including heritage trees. **Definitions** A protected tree shall consist of any of the following: (a) Any tree having a main trunk or stem measuring 37.7 inches or greater in circumference (12 inches or more in diameter) at a height of 4.5 feet above ground level, or in the case of multi-trunk trees a total of 75.4 inches in circumference (24 inches or more of the diameter) of all trunks in the following areas of the County: (1) Parcels zoned "Hillsides" (three acres or less); (2) Parcels within a "-d" (Design Review) combining zoning district; (3) Parcels within the Los Gatos Hillside Specific Plan Area. (b) Any tree within the "-h1" Historic Preservation zoning district for New Almaden having a main trunk or stem measuring six inches or more in diameter (18.8 inches or greater in circumference) at a height of 4.5 feet above ground level, or in the case of multi-trunk trees, a total of 12 inches in diameter (37.7 inches in circumference) of all trunks at 4.5 feet above ground. For parcels having a base zoning district of "HS, Hillside" within the "-h1" combining zoning district, this provision supersedes C16-3(a)(1). (c) Any heritage tree. (d) Any tree required to be planted as a replacement for an unlawfully removed tree. (e) Any tree that was required to be planted or retained by the conditions of approval for any use permit, building site approval, grading permit, architectural and site approval, design review, special permit or subdivision. (f) On any property owned or leased by the County, any tree which measures over 37.7 inches in circumference (12 inches or more in diameter) measured 4.5 feet above the ground, or which exceeds 20 feet in height. (g) Any tree, regardless of size, within road rights-of-way and easements of the County, whether within or without the unincorporated territory of the County. *Heritage Tree*: "any tree which, because of its history, girth, height, species, or other unique quality, has been recommended for inclusion on

Policy Title	Summary
	the heritage resource inventory by the Historical Heritage Commission and found by the Board of Supervisors to have special significance to the community, and which has therefore been included in the heritage resource inventory adopted by resolution of the Board of Supervisors." *Prune*: "to trim or cut away any limbs or branches of a tree which will not adversely impair the health of the tree." *Remove*: "Remove and removal shall include cutting down, burning, poisoning, or otherwise diminishing the vigor of or destroying a tree, as well as adversely pruning or topping a tree." **Permits** Except as otherwise provided below in Section C16-4 (Exceptions), it shall be unlawful for any person to remove any protected tree on any private or public property in designated areas of the County without having first obtained an administrative permit from the County Planning Office or an encroachment permit from the Department of Roads and Airports. Where the tree in question has been designated as a heritage tree, all applications for a tree removal permit shall be forwarded to the County Historical Heritage Commission (HHC) by the Planning Office. A site visit may be conducted by representatives of the HHC and a written opinion from an arborist, forester, or other expert may be required to evaluate the status of the tree. … Permit Applications (Sec. C16-7). Any person desiring to remove any tree regulated herein shall file an application with the County Planning Office for an administrative permit not less than ten days prior to the date of such planned removal. In the case of heritage trees, such application must be made not less than 90 days prior to the date of the planned removal, following the hearing procedures set forth in Section C16-12 and Section C16-13 below. Any application for a special permit or use permit for tree cutting shall be filed in accordance with procedures set forth in Chapters 5.60 and 5.65 of the County Zoning Ordinance. Removal of any tree, regardless of size, located within a County road right-of-way shall require an encroachment permit from the Department of Roads and Airports not less than 60 days prior to planned removal... In addition to standard information required as part of all applications for administrative permits, special permits, use permits or encroachment permits, the following information shall be included in such applications for tree removal: (a)A brief statement of the reasons for removal of the tree. (b)A photograph of the tree(s) proposed for removal. (c)A description of the method to be used in the removal of the tree(s). Applicant should demonstrate that good harvesting practices will be used. (d)A tree survey (map) with the accurate location, number, species, size (diameter measured 4.5 feet above ground, approximate height, and approximate canopy diameter), general health, and approximate age, if known, of the tree or trees in question. (e)A replanting and/or re-vegetation plan for all trees to be removed. Replacement trees shall be of a like kind and species of tree removed, if native and feasible, or of a kind and species to be determined by the Planning Department. The location of the replacement tree(s) need not be in the same location of the tree removed. Replacement tree planting shall

Policy Title	Summary
	utilize at least five-gallon size stock. The ratio of trees removed to trees planted shall be determined by the Planning Department. An erosion control plan may also be required where deemed appropriate by County staff. … (Ord. No. NS-1203.107, § 1, 2-11-97; Ord. No. NS-1200.318, § 30, 3-28-06) … Criteria for Permit Approval (Sec. C16-11). The Planning Office or any other person or body charged with determining whether to grant, conditionally grant or deny an administrative permit, special permit, use permit, or encroachment permit for tree removal shall take into account the following factors in determining what action to take upon the permit application: … (b)The potential impact the removed tree or trees may have upon adjacent trees (i.e. increased windthrow). Where appropriate, removal may necessitate an assessment of potential impacts upon adjacent trees by a certified arborist or forester, along with the development of mitigations to lessen such impacts. … (d)The topography of the land and the effect of the proposed tree removal upon erosion, soil retention, and the diversion or increased flow of sediment. (e)The number, species, size, and location of existing trees in the area, and the effect the proposed removal would have upon shade, privacy impact, scenic beauty, and property values of the area. … (Ord. No. NS-1203.107, § 1, 2-11-97)
City of Santa Clara	
City of Santa Clara 2010-2035 General Plan (City of Santa Clara 2010)	The City of Santa Clara General Plan policies applicable to biological resources are described in the Conservation Goals and Policies Section in the Goals and Policies Chapter. Applicable goals and policies are as follows: ▪ Goal 5.10.1-G1: The protection of fish, wildlife and their habitats, including rare and endangered species. ▪ Goals 5.10.1-G2: Conservation and restoration of riparian vegetation and habitat. ▪ Policy 5.10.1-P1: Require environmental review prior to approval of any development with the potential to degrade the habitat of any threatened or endangered species. ▪ Policy 5.10.1-P2: Work with Santa Clara Valley Water District and require that new development follow the “Guidelines and Standards for Lands Near Streams” to protect streams and riparian habitats. ▪ Policy 5.10.1-P3: Require preservation of all City-designated heritage trees listed in the Heritage Tree Appendix 8.10 of the General Plan. ▪ Policy 5.10.1-P4: Protect all healthy cedars, redwoods, oaks, olives, bay laurel and pepper trees of any size, and all other trees over 36

Policy Title	Summary
	inches in circumference measured from 48 inches above-grade on private and public property as well as in the public right-of-way. ▪ Policy 5.10.1-P5: Encourage enhancement of land adjacent to creeks in order to foster the reinstatement of natural riparian corridors where possible.
Santa Clara Tree and Shrub Removal Ordinance (City of Santa Clara 2017)	Chapter 12.35 of the City of Santa Clara Municipal Code prohibits the removal or alteration of trees, plants, or shrubs within a street or public place without a written permit from the superintendent of streets and establishes penalties for noncompliance. Additionally, the City's Design Guidelines require that mature trees that are proposed to be removed be replaced on-site to the extent feasible at a 1:1 ratio with a 24-inch or 36-inch box specimen tree.
City of San Jose	
City of San Jose 2040 General Plan (City of San Jose 2011)	The City of San Jose General Plan policies applicable to biological resources are described under Natural Resources with the overarching goal that "The City should balance resource conservation and urban development to maximize achievement of environmental, economic and social objectives." Applicable policies are subdivided by habitat and species as follows: ▪ Woodlands, Grasslands, Chaparral, and Scrub Goal: Protect the biological diversity and scenic characteristics of grasslands, woodlands, chaparral, and scrub in hillside areas. ▪ Policy 3: The City should cooperate with other agencies in the preservation of hillside vegetation. ▪ Policy 4: Grading should be designed to minimize the removal of significant vegetation. ▪ Policy 8: Serpentine grasslands, particularly those supporting sensitive serpentine bunchgrass communities of plant and animal species of concern, should be preserved and protected to the greatest extent feasible. When disturbance cannot be avoided, appropriate measures should be required to restore, or compensate for loss of serpentine bunchgrass communities or habitat of species of concern. ▪ Wetlands Goal: Preserve, protect, and restore riparian corridors and upland wetlands within the City of San Jose's Sphere of Influence. ▪ Policy 1: Creeks and natural riparian corridors and upland wetlands should be preserved whenever possible. ▪ Policy 2: New public and private development adjacent to riparian corridors should be consistent with the provisions of the Riparian Corridor Policy Study. ▪ Policy 3: New development within the Urban Service Area should be set back from the outside edge of riparian habitat (or top of bank, whichever is greater) a distance sufficient to buffer the impacts of adjacent human activities and provide avenues for wildlife dispersal. ▪ Policy 4: New development should be designed to protect adjacent riparian corridors from encroachment of lighting, exotic landscaping, noise and toxic substances into the riparian zone. ▪ Policy 5: When disturbances to riparian corridors and upland wetlands cannot be avoided, appropriate measures should be required to restore, or compensate for damage to the creeks or riparian corridors.

Policy Title	Summary
	▪ Policy 8: Natural riparian corridors outside the Urban Service Area should be protected from disturbance associated with development (such as structures, roadways, sewage disposal facilities and overhead utility lines, except those required for flood control or bridging) by a minimum 150-foot setback from the top bank line, wherever feasible. ▪ Species of Concern Goal: Preserve habitat suitable for Species of Concern, including threatened and endangered species. ▪ Policy 2: Habitat areas that support Species of Concern should be retained to the greatest extent feasible. ▪ Policy 3: Recreational uses in wildlife refuges, nature preserves, and wilderness areas in parks should be limited to those activities which have minimal impact on sensitive habitats. ▪ Policy 4: New development on undeveloped properties throughout the City contributes to the regional loss of Burrowing Owl habitat. To offset this loss of habitat, the City should require either habitat preservation on- or off-site or other appropriate measures for habitat acquisition, habitat enhancement, and maintenance of local habitat bank.
City of San Jose Planning, Building & Code Enforcement – Tree Removal (City of San Jose 2017)	A permit is needed if the tree is: ▪ a street tree; ▪ a heritage tree; ▪ an ordinance-size tree, live or dead; or ▪ any tree located on multifamily, commercial, industrial, or mixed use property or in a common area. **Street Trees** Street trees are those located in the public right-of-way between the curb and sidewalk; in some locations, the public right-of-way may be up to 12 feet from the curb. The City's Department of Transportation (DOT) provides no-cost permits for pruning street trees and oversees their removal. It is illegal to prune or remove a street tree without a permit; fines up to $15,000 per tree may apply. **Heritage Trees** The City's Heritage Tree List identifies over 100 trees with special significance to the community because of their size, history, unusual species, or unique quality. This list is updated from time to time to add or delete certain trees. Pursuant to Chapter 13.28 of the San Jose Municipal Code, it is illegal to prune or remove a heritage tree without first consulting the City Arborist and obtaining a permit; fines up to $30,000 per tree may apply. **Ordinance-Size Trees** An ordinance-size tree on private property is either: Single Trunk - 56 inches or more in circumference at 2 feet above ground; or Multi-trunk - The combined measurements of each trunk circumference (at 2 feet above ground) add up to 56 inches or more. For multifamily residences, commercial properties, and industrial properties, a permit is required for the removal of trees of any size. For trees on these properties, a Tree Removal Permit is required if the tree is ordinance sized, or a Permit Adjustment is required if the tree is smaller than ordinance sized.

Policy Title	Summary
City of Morgan Hill	
Morgan Hill General Plan (City of Morgan Hill 2016)	The City of Morgan Hill General Plan policies applicable to biological resources are described under the general plan's Open Space and Conservation element. Applicable policies under that element are sole within the goal for "Plants and Wildlife" as follows: ▪ Policy 6a: Preserve all fish and wildlife habitats in their natural state whenever possible. Consider development impacts upon wildlife and utilize actions to mitigate those environmental impacts. ▪ Policy 6b: Minimize impacts upon wildlife when considering extending annexations, urban service areas, and other governmental actions that permit urban development of previously undeveloped property. ▪ Policy 6c: Preserve outstanding natural features, such as the skyline of a prominent hill, rock outcroppings, and native or historically significant trees. ▪ Policy 6d: Development will be designed to conserve soil and avoid erosion. ▪ Policy 6e: Identify and protect wildlife, rare and endangered plants and animals, and heritage resources from loss and destruction. ▪ Policy 6f: Access to creeks should be of sufficient width to accommodate trails, flood control access, and protection of riparian habitat. ▪ Policy 6g: Encourage use of native plants, especially drought-resistant species, in landscaping to the extent possible.
City of Morgan Hill Tree Removal Policy (City of Morgan Hill 2017)	**Tree Removal** Some trees in the city are protected as significant trees by the municipal code. It is unlawful for any person to cut down, remove, poison, or otherwise kill or destroy, or cause to be removed any significant tree or community of trees on any city or private property without a permit. Significant trees on residential properties include all indigenous species having a circumference of 18 inches or more measured at 4.5 feet vertically above the ground or immediately below the lowest branch, whichever is lower. All street trees, regardless of the type of tree are considered to be significant trees. An approved tree removal permit is required to remove any significant tree.
City of Gilroy	
City of Gilroy 2020 General Plan (City of Gilroy 2002)	The City of Gilroy's General Plan policies applicable to biological resources are described under the general plan's Open Space and Habitat Areas Goal. The goal states "[p]reservation, protection, and maintenance of Gilroy's natural open space resources (including creeks, meadows, hills, woodlands, and vistas) for their watershed protection, habitat preservation, recreation, and aesthetic value, ensuring that they retain their natural qualities and beauty in perpetuity." Applicable policies to achieve that goal are as follows: ▪ Policy 20.02-Creek Protection: Protect the ecological, aesthetic and recreation value of the creeks that flow through the Gilroy Planning Area from urban encroachment and degradation. Ensure that new development preserves the function of natural drainages, including small canyons and seasonal creeks. The easements and setbacks

Policy Title	Summary
	adjacent to these creeks will be maintained in open space. Access to creeks should be of sufficient width to accommodate trails, flood control access, and protection of riparian habitat. ▪ Policy 20.03-Plant and Wildlife Habitats: Preserve important plant and wildlife habitats, including riparian communities, heavily vegetated hillside areas, unique hillside ecosystems (e.g., serpentine barrens), creeks, and sensitive nesting sites. Loss of these habitats should fully offset through creation of habitat of equal value, with the compensation rate for habitat creation determines by a qualified biologist. ▪ Policy 20.04-Rare and Endangered Species: Limit development in areas that support the California Tiger Salamander and other rare or endangered species. If development of these areas must occur, any loss of habitat should be fully compensated on-site. Off-site mitigation, if necessary, should occur within the Gilroy Planning Area whenever possible, and must be accompanied by plans and a monitoring program prepared by a qualified biologist. ▪ Policy 20.09-Preservation in Perpetuity: When open space easements, dedications or other land preservation measures are required as a condition of project approval, ensure that dedicated lands are preserved in perpetuity.
San Benito County	
San Benito County 2035 General Plan (San Benito County 2015)	The Natural and Cultural Resources Element addresses management and conservation of biological resources in San Benito County. The following goals relate to the proposed project: ▪ NCR-1.1 - Maintenance of Open Space: The County shall support and encourage maintenance of open space lands that support natural resources, agricultural resources, recreation, tribal resources, wildlife habitat, water management, scenic quality, and other beneficial uses. ▪ NCR-1.2 - Conservation Easements: The County shall support and encourage the use of conservation easements to protect open space that contains valuable natural resources. ▪ NCR-2.4 - Maintain Corridors for Habitat: The County shall protect and enhance wildlife migration and movement corridors to ensure the health and long-term survival of local animal and plant populations, in particular contiguous habitat areas, in order to increase habitat value and lower land management costs. As part of this effort, the County shall require road and development sites in rural areas to: (a.) Be designed to maintain habitat connectivity with a system of corridors for wildlife or plant species and avoiding fragmentation of open space areas; and (b.) Incorporate measures to maintain the long-term health of the plant and animal communities in the area, such as buffers, consolidation of/or rerouting access, transitional landscaping, linking nearby open space areas, and habitat corridors. ▪ NCR-2.5 - Mitigation for Wetland Disturbance or Removal: The County shall encourage the protection of the habitat value and biological functions of oak woodlands, native grasslands, riparian and aquatic resources, and vernal pools and wetlands. The County shall require that development avoid encroachment and require buffers around these habitats to the extent practicable. The County shall further require mitigation for any development proposals that have the potential to reduce these habitats. Recreational trails and other features established

Policy Title	Summary
	within natural wetlands and aquatic and riparian buffer areas shall be, as long as such areas are not required to meet the Americans with Disabilities Act, located along the outside of the sensitive habitat whenever possible to minimize intrusions and maintain the integrity of the habitat. In all cases where intrusions into these buffers are made, only the minimum amount of vegetation necessary to construct the feature shall be removed. ▪ NCR-2.7 - Mitigation of Oak Woodlands: The County shall encourage development near oak woodlands to be clustered to avoid, where technically or economically practical, the loss of heritage oak trees. The County shall require transitional buffers to help maintain viable ecosystems where appropriate. Where removal of trees cannot be avoided, the County shall require project applicants to prepare a mitigation plan that identifies on- or off-site tree replacement. ▪ NCR-2.8 - Pre-Development Biological Resource Assessment: The County shall require the preparation of biological resource assessments for new development proposals as appropriate. The assessment shall include the following: a biological resource inventory based on a reconnaissance-level site survey, and an analysis of anticipated project impacts to: potentially occurring special-status species (which may require focused special-status plant and/or animal surveys); an analysis of sensitive natural communities; wildlife movement corridors and nursery sites on or adjacent to the project site; potentially jurisdictional wetlands/waterways; and locally protected biological resources such as trees. The assessment shall contain suggested avoidance, minimization, and/or mitigation measures for significant impacts to biological resources. ▪ NCR-2.9 - Mitigation Funding and Site Protection: The County shall require that project applicants demonstrate that adequate funding can be provided to implement all required biological mitigation and monitoring activities. Habitat preserved as part of any mitigation and monitoring plan shall be preserved through a conservation easement, deed restriction, or other method to ensure that the habitat remains protected. ▪ NCR- 2.10 - Invasive Species: The County shall require that new developments avoids the introduction or spread of invasive plant species during construction by minimizing surface disturbance, seeding and mulching disturbed areas with certified weed-free native mixes, and using native or noninvasive species in erosion control plantings.
Merced County	
Merced County 2030 General Plan, Natural Resources Element (County of Merced 2013)	The Natural Resources Element addresses protection, preservation, and enhancement of biological resources in Merced County. The following policies relate to the proposed project: ▪ Policy NR-1.1: Habitat Protection: Identify areas that have significant long-term habitat and wetland values, including riparian corridors, wetlands, grasslands, rivers and waterways, oak woodlands, vernal pools, and wildlife movement and migration corridors, and provide information to landowners. ▪ Policy NR-1.2: Protected Natural Lands: Identify and support methods to increase the acreage of protected natural lands and special habitats, including wetlands, grasslands, vernal pools, and wildlife movement

Policy Title	Summary
	and migration corridors, potentially through the use of conservation easements. ▪ Policy NR-1.4 Important Vegetative Resource Protection: Minimize the removal of vegetative resources which stabilize slopes, reduce surface water runoff, erosion, and sedimentation. ▪ Policy NR-1.5 Wetland and Riparian Habitat Buffer: Identify wetlands and riparian habitat areas and designate a buffer zone around each area sufficient to protect them from degradation, encroachment, or loss. ▪ Policy NR-1.6: Terrestrial Wildlife Mobility: Encourage property owners within or adjacent or designated habitat connectivity corridors that have been mapped or otherwise identified by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service to manage their lands in accordance with such mapping programs. ▪ Policy NR-1.8: Use of Native Plant Species for Landscaping: Encourage the use of native plant species in landscaping, and, where the County has discretion, require the use of native plant species for landscaping. ▪ Policy NR-1.10: Aquatic and Waterfowl Habitat Protection: Cooperate with local, state, and federal water agencies in their efforts to protect significant aquatic and waterfowl habitats against excessive water withdrawals or other activities that would endanger or interrupt normal migratory patterns or aquatic habitats. ▪ Policy NR-1.11: On-Going Habitat Protection and Monitoring: Cooperate with local, state, and federal agencies to ensure that adequate on-going protection and monitoring occurs adjacent to rare and endangered species habitats or within identified significant wetlands. ▪ Policy NR-1.12: Wetland Avoidance: Avoid or minimize loss of existing wetland resources by careful placement and construction of any necessary new public utilities and facilities, including roads, railroads, high-speed rail, sewage disposal ponds, gas lines, electrical lines, and water/wastewater systems. ▪ Policy NR-1.13: Wetland Setbacks: Require an appropriate setback, to be determined during the development process, for developed and agricultural uses from the delineated edges of wetlands. ▪ Policy NR-1.17: Agency Coordination: Consult with private, local, state, and federal agencies to assist in the protection of biological resources and prevention of degradation, encroachment, or loss of resources managed by these agencies. ▪ Policy NR-1.20: Conservation Easements: Encourage property owners to work with land trusts and state and federal agencies to pursue voluntary conservation easements. ▪ Policy NR-1.21: Special-Status Species Surveys and Mitigation: Incorporate the survey standards and mitigation requirements of state and federal resource management agencies for use in the County's review processes for both private and public projects.

Hydrology and Water Resources

Table 7 Regional and Local Plans and Policies Relevant to Hydrology and Water Resources

Plan/Policy Document	Summary
Santa Clara County	
Santa Clara County General Plan (1994)	The *Santa Clara County General Plan* was adopted in 1994. The general plan includes the following goals and policies relevant to hydrology and water resources: Resource Conservation ▪ C-RC 2: The County shall provide leadership in efforts to protect or restore valuable natural resources, such as wetlands, riparian areas, and woodlands, and others: a. for County-owned lands; and b. through multi-jurisdictional endeavors. ▪ C-RC 18: Water quality countywide should be maintained and improved where necessary to ensure the safety of water supply resources for the population and the preservation of important water environments and habitat areas. ▪ C-RC 19: The strategies for maintaining and improving water quality on a countywide basis, in addition to ongoing point source regulation, should include: a. effective non-point source pollution control; b. restoration of wetlands, riparian areas, and other habitats which serve to improve Bay water quality; and c. comprehensive Watershed Management Plans and "best management practices" (BMPs). ▪ C-RC 20: Adequate safeguards for water resources and habitats should be developed and enforced to avoid or minimize water pollution of various kinds, including: a. erosion and sedimentation; b. organic matter and wastes; c. pesticides and herbicides; d. effluent from inadequately functioning septic systems; e. effluent from municipal wastewater treatment plants; f. chemicals used in industrial and commercial activities and processes; g. industrial wastewater discharges; h. hazardous wastes; and i. non-point source pollution. ▪ C-RC 22: Countywide, compliance should be achieved with the requirements of the National Pollution Discharge Elimination System (NPDES) permit for discharges into S.F. Bay, and to that end, the Countywide Nonpoint Source Pollution Control Program should receive the full support and participation of each member jurisdiction. ▪ C-RC 34: Restoration of habitats should be encouraged and utilized where feasible, especially in cases where habitat preservation and flood control, water quality, or other objectives can be successfully combined. Safety and Noise ▪ C-HS 28: Countywide strategies for reducing the threat of natural hazards to life and property should include: a. Inventory hazards and monitor changing conditions. b. Minimize the resident population within high hazard areas. c. Design, locate and regulate development to avoid or withstand hazards. d. Reduce the magnitude of the hazard, if feasible. e. Provide public information regarding natural hazards. ▪ C-HS 33: Development in areas of natural hazards should be designed, located, and otherwise regulated to reduce associated risks, by regulating the type, density, and placement of development where it will not: a. be directly jeopardized by hazards; b. increase hazard potential; and c. increase risks to neighboring properties. ▪ C-HS 34: Flood control measures should be considered part of an overall community improvement program and advance the following goals, in addition to

Plan/Policy Document	Summary
	flood control: a. resource conservation; b. preservation of riparian vegetation and habitat; c. recreation; and d. scenic preservation of the county's streams and creeks ▪ C-HS 42: The long-term viability and safety of underground aquifers and groundwater systems countywide shall be protected to highest degree feasible. ▪ C-HS 44: All new on-site wastewater treatment systems should be located only in areas where: a. there is reasonable assurance that they will function well over a long period; b. they can be designed to have a minimum negative impact on the environment; and c. they will not contaminate wells, groundwater or surface water. ▪ C-HS 45: On-site wastewater treatment systems should not be allowed in areas where soil characteristics impede their operation (e.g., areas of high groundwater conditions, areas with saturated soils, areas with limited depth to bedrock, etc.). ▪ C-HS 47: Groundwater quality should be monitored to ensure the long-term integrity of countywide water resources. Growth and Development ▪ R-GD 28: Due to the prevalence of steeply sloping land, geologic, seismic, and other natural hazards, soil characteristics, and other development issues, including the need for adequate access and onsite wastewater treatment, the County shall thoroughly evaluate development proposals on slopes exceeding 30% to secure the public health, safety, and welfare. Resource Conservation ▪ R-RC 11: Areas with prime percolation capabilities shall be protected to the maximum extent possible, and placement of significant pollution sources within such areas shall be avoided. ▪ R-RC 13: Sedimentation and erosion shall be minimized through controls over development, including grading, quarrying, vegetation removal, road and bridge construction, and other uses which pose such a threat to water quality. ▪ R-RC 15: Commercial and industrial uses such automobile dismantlers, waste transfer disposal facilities, light industries, uses requiring septic systems, and other uses that have the greatest potential for pollution shall not be located within the vicinity of streams, reservoirs, or percolation facilities where contaminants could easily come in contact with flood waters, high groundwater, flowing streams, or reservoirs. Such uses shall be required to reduce any threat of contamination to an insignificant level as a condition of approval. ▪ R-RC 31: Natural streams, riparian areas, and freshwater marshes shall be left in their natural state providing for percolation and water quality, fisheries, wildlife habitat, aesthetic relief, and educational or recreational uses that are environmentally compatible. Streams which may still provide spawning areas for anadromous fish species should be protected from pollution and development impacts which would degrade the quality of the stream environment. ▪ R-RC 32: Riparian and freshwater habitats shall be protected through the following general means: o setback of development from the top of the bank; o regulation of tree and vegetation removal; o reducing or eliminating use of herbicides, pesticides, and fertilizers by public agencies; o control and design of grading, road construction, and bridges to minimize environmental impacts and avoid alteration of the streambed and stream banks (free span bridges and arch culverts, for example); and

Plan/Policy Document	Summary
	○ protection of endemic, native vegetation. ▪ R-RC 33: Public projects shall be designed to avoid damage to freshwater and stream environments. ▪ R-RC 34: In floodplains that are not already developed, land uses shall be restricted to avoid the need for major flood control projects which would alter stream flows and vegetation. ▪ R-RC-35: Flood control modifications to be made in streams that have substantial existing natural areas should employ flood control designs which enhance riparian resources and avoid to the maximum extent possible significant alteration of the stream, its hydrology, and its environs. ▪ R-RC-37: Lands near creeks, streams, and freshwater marshes shall be considered to be in a protected buffer area, consisting of the following: ○ 150 feet from the top bank on both sides where the creek or stream is predominantly in its natural state; ○ 100 feet from the top bank on both sides of the waterway where the creek or stream has had major alterations; and ○ In the case that neither (1) nor (2) are applicable, an area sufficient to protect the stream environment from adverse impacts of adjacent development, including impacts upon habitat, from sedimentation, biochemical, thermal and aesthetic impacts. ▪ R-RC-38: Within the aforementioned buffer areas, the following restrictions and requirements shall apply to public projects, residential subdivisions, and other private non-residential development: ○ No building, structure or parking lots are allowed, exceptions being those minor structures required as part of flood control projects. ○ No despoiling or polluting actions shall be allowed, including grubbing, clearing, unrestricted grazing, tree cutting, grading, or debris or organic waste disposal, except for actions such as those necessary for fire suppression, maintenance of flood control channels, or removal of dead or diseased vegetation, so long as it will not adversely impact habitat value. ○ Endangered plant and animal species shall be protected within the area. ▪ R-RC-39: Within areas immediately adjacent to the stream buffer area, new development should minimize environmental impacts on the protected buffer area, and screening of obtrusive or unsightly aspects of a project should be considered as a means of preserving the scenic value of riparian areas. ▪ R-RC-40: Where new roads, clustered residential development, or subdivisions are proposed in proximity of streams and riparian areas, they should be designed so that: ○ riparian vegetation is retained; ○ creeks and streams remain open and unfenced; and ○ there is adequate separation of new roads and building sites from the stream environment.
Santa Clara County Ordinance Code (2016a-c)	The Santa Clara Ordinance Code was originally adopted in 1972. The Code includes the following sections relevant to hydrology and water resources: Title B: Regulations ▪ Division B11.5 Nonpoint Source Pollution: requires compliance with the MRP within the Phase I MS4 areas in Santa Clara County, including riparian setbacks for San Martin

Plan/Policy Document	Summary
	▪ Division B33 Water Conservation in Landscaping: provides design standards for landscape areas that minimize runoff and water consumption Title C: Construction, Development, and Land Use ▪ Division C12 Chapter III Grading and Drainage Article 8 – Design Standards: requires grading to be performed to minimize runoff, erosion, and sedimentation, and regulates grading through a permitting framework ▪ Division C12 Chapter VII Floodplain Management: designates the floodplain manager for floodplains with County jurisdiction, provides design standards for development and construction in floodplains, and requires the City's review of proposed developments in floodplains prior to approval.
Santa Clara Valley Water District Ordinance 90-1 Wells (1990)	The SCVWD Ordinance 90-1 Wells requires a permit for any digging, boring, drilling, deepening, refurbishing, or destroying a water well, cathodic protection well, observation well, monitoring well, exploratory boring (45 feet or deeper), or other deep excavation that intersects the groundwater aquifers of Santa Clara County.
Santa Clara Valley Water District Ordinance 06-1 Water Resources Protection (2010)	The Water Resources Protection Ordinance requires that project sponsors obtain and Encroachment Permit for modifications on SCVWD facilities or easements. SCVWD relies on the Water Resources Protection Manual to administer the requirements of the ordinance, including specific erosion control, groundwater assessment, and design requirements.
Santa Clara Valley Water District Groundwater Management Plan (2016)	The Santa Clara Valley Water District Groundwater Management Plan was published in 2016. The Plan includes the following policies relevant to hydrology and water resources: ▪ Strategy 1: Manage groundwater in conjunction with surface water. ▪ Strategy 2: Implement programs to protect and promote groundwater quality. ▪ Strategy 3: Maintain and develop adequate groundwater models and monitoring networks. Strategy 4: Work with regulatory and land use agencies to protect recharge areas, promote natural recharge, and prevent groundwater contamination.
The Santa Clara Valley Greenprint (Santa Clara Valley Open Space Authority 2014)	The Santa Clara Valley Greenprint was published in 2014. The guide for protecting open space and livable communities includes the following strategies relevant to hydrology and water resources: ▪ Strategy 1a: Initiate and participate in joint projects with the Santa Clara Valley Water District, the San Francisco Public Utilities Commission, and others to protect water resources, particularly in upper watersheds, groundwater recharge areas, urban areas, and undeveloped floodplains. ▪ Strategy 1b: Advocate policies and use land protection measures that prevent urban development in groundwater recharge areas, particularly the Coyote Valley. ▪ Strategy 1c: Encourage cities and public agencies to integrate protection of wetlands, floodplains, and riparian areas into land use and capital planning and mitigation projects to increase resilience to climate change impacts. ▪ Strategy 1d: Expand the Authority's Urban Open Space Program guidelines to promote restoration of urban streams and riparian habitats, groundwater recharge areas, and floodplains. ▪ Strategy 1e: Implement restoration projects in urban areas to reduce impervious surfaces and urban runoff, slowing water and increasing opportunities for infiltration into groundwater basins.

Plan/Policy Document	Summary
	▪ Strategy 1f: Explore pilot projects to increase local water supplies through construction of small-scale managed aquifer recharge projects such as the RCD's Bokariza project in the lower Pajaro River watershed. ▪ Strategy 1g: Develop programs with the Natural Resources Conservation Service, Resource Conservation Districts, and other partners to implement watershed protection, stewardship, and restoration programs on working farms and ranches through conservation easements, water-related ecosystem service payments, or performance-based management agreements. ▪ Strategy 1h: Develop fuels management plans and initiatives to reduce potential for erosion, landslides, and sedimentation following a catastrophic fire. ▪ Strategy 2a: Participate in the Bay Area and Pajaro Integrated Regional Water Management planning efforts to identify opportunities for protecting water resources. Seek partnerships with the SCVWD, Pajaro River Flood Prevention Authority, the Association of Bay Area Governments, the San Francisco Estuary Institute, the San Francisco Estuary Partnership, the San Francisco Bay Bird Observatory, Trout Unlimited, The Nature Conservancy, and other organizations to fund and implement priority projects. ▪ Strategy 2b: Participate in Santa Clara Valley Water District's water resources watershed master planning efforts to identify and prioritize land conservation and stewardship projects and investments, including opportunities for watershed restoration on Authority preserves. ▪ Strategy 2c: Engage in watershed-based conservation partnerships including the Upper Alameda Watershed Partnership and the Upper Pajaro Conservation Collaboration. These partnerships aim to identify non-regulatory tools, strategies, and financial incentives to promote watershed conservation and stewardship in these agricultural landscapes. ▪ Strategy 2d: Promote coordination between regulatory agencies and watershed stakeholders to facilitate priority watershed restoration projects, including larger riparian buffers or setbacks in both urban and rural settings. Explore feasibility of expanding the Integrated Watershed Restoration Program for San Mateo and Santa Cruz Counties to include Santa Clara County to streamline permitting and use of grant funds for watershed restoration projects. ▪ Strategy 2e: Support efforts of the NRCS and RCDs to fund local watershed coordinator position(s) and secure grant funds for restoration. ▪ Strategy 2f: Advocate for county and city land use planning and policies that protect water resources through protective zoning and strong riparian protection ordinances. ▪ Strategy 3a: Complete and build on efforts such as the Healthy Lands & Healthy Economies initiative (Batker et al. 2014) to quantify the economic value of open spaces and working lands to protect local groundwater supplies, reduce water treatment costs, and provide flood control. ▪ Strategy 3b: Develop specific case studies by watershed (for example, the Coyote watershed and Santa Clara Valley aquifer) that identify multi-benefit water resource conservation projects and potential new funding sources. ▪ Strategy 3c: Seek funding from the NRCS Conservation Innovation Grant program and other sources to evaluate emerging markets for water quality improvements, wetland restoration, habitat conservation, and carbon sequestration. ▪ Strategy 3d: Explore use of market-based incentives for protecting strategic water resources in the Santa Clara Valley though development of a pilot ecosystem services credit trading and banking project.

Plan/Policy Document	Summary
	▪ Strategy 4a: Ensure that leases and management agreements for the Authority's agricultural tenants are written to protect water resources from depletion, pollution, development, and fire, including promotion of organic operations to limit the use of pesticides and fertilizers. ▪ Strategy 4b: Ensure that management plans for Authority lands identify opportunities to improve water quality and aquatic habitat (for example, by decommissioning unnecessary roads, upgrading culverts, or restoring ponds and riparian areas). ▪ Strategy 4c: Demonstrate and interpret watershed restoration programs and projects on Open Space Authority preserves. Work with the NRCS, RCDs, and the SCVWD to develop public workshops and training about watershed protection techniques and funding sources. ▪ Strategy 4d: Seek funding and partnerships for pilot projects on Open Space Authority preserves to demonstrate effectiveness of new tools and techniques for water capture and recharge, such as off-stream ponds and managed recharge basins. Small-scale projects located throughout upper and middle watersheds can increase water supplies and reduce the need for downstream flood protection. ▪ Strategy 5a: Seek funding and partnerships with the NRCS, RCDs, and SCVWD to develop interpretive materials and watershed education programs for use by Authority staff and volunteers on Authority properties. ▪ Strategy 5b: Encourage local schools and watershed educators to utilize Authority lands in their programs, and seek funding and partnerships with the NRCS, RCDs, and SCVWD to support those programs. ▪ Strategy 5c: Promote research and citizen science on Authority lands to collect information about watershed health. ▪ Strategy 5d: Feature water conservation and watershed restoration projects funded through US Department of Agriculture Natural Resources Conservation Service programs such as the Wildlife Habitat Incentive Program, Environmental Quality Incentives Program, and other grants to encourage local use of those funding sources.
City of Santa Clara	
City of Santa Clara General Plan (2010)	The City of Santa Clara adopted the 2010-2035 General Plan on November 16, 2010. The general plan includes the following environmental quality goals and policies applicable to hydrology and water resources: Conservation ▪ 5.10.1-P2: Work with Santa Clara Valley Water District and require that new development follow the "Guidelines and Standards for Lands Near Streams" to protect streams and riparian habitats. ▪ 5.10.1-P6: Require adequate wastewater treatment and sewer conveyance capacity for all new development. ▪ Water ▪ 5.10.4-P4: Require and adequate water supply and water quality for all new development. ▪ 5.10.4-P5: Prohibit new development that would reduce water quality below acceptable state and local standards. ▪ 5.10.4-P10: Work with Santa Clara Valley Water District to minimize undesirable compaction of aquifers and subsidence of soils.

Plan/Policy Document	Summary
	▪ 5.10.4-P12: Encourage diversion of runoff from downspouts, and replacement of hardscapes to landscaped areas and permeable surfaces ▪ Safety ▪ 5.10.5-P5: Regulate development, including remodeling or structural rehabilitation, to ensure adequate mitigation of safety hazards, including flooding, seismic, erosion, liquefaction and subsidence dangers. ▪ 5.10.5-P10: Support efforts by the Santa Clara Valley Water District to reduce subsidence. ▪ 5.10.5-P11: Require that new development meet stormwater and water management requirements in conformance with state and regional regulations. ▪ 5.10.5-P13: Require that development complies with the Flood Damage Protection Code ▪ 5.10.5-P15: Require new development to minimize paved and impervious surfaces and promote on-site best management practices for infiltration and retention, including grassy swales, pervious pavement, covered retention areas, bioswales, and cisterns, to reduce urban water run-off. ▪ 5.10.5-P16: Require new development to implement erosion and sedimentation control measures to maintain an operational drainage system, preserve drainage capacity and protect water quality. ▪ 5.10.5-P17: Require that grading and other construction activities comply with the Association of Bay Area Governments' Manual of Standards for Erosion and Sediment Control Measures and with the California Stormwater Quality Association, Stormwater Best Management Practice Handbook for Construction ▪ 5.10.5-P18: Implement the Santa Clara Valley Nonpoint Source Pollution Control Program, Santa Clara Valley Urban Runoff Pollution Prevention Program and the Urban Runoff Management Plan. ▪ 5.10.5-P19: Limit development activities within riparian corridors to those necessary for improvement or maintenance of stream flow. ▪ 5.10.5-P20: Maintain, upgrade, and replace storm drains throughout the City to reduce potential flooding. ▪ 5.10.5-P21: Require that storm drain infrastructure is adequate to serve all new development and is in place prior to occupancy. ▪ 5.10.5-P22: Regulate development on sites with known or suspected contamination of soil and/or groundwater to ensure that construction workers, the public, future occupants and the environment are adequately protected from hazards associated with contamination, in accordance with applicable regulations. ▪ 5.10.5-P23: Require appropriate clean-up and remediation of contaminated sites.
Santa Clara City Code (2017, 2018)	The Santa Clara City Code is current through Ordinance 1966, passed in 2017. The Code includes the following titles and chapters relevant to hydrology and water resources: Title 13: Public Services ▪ Chapter 13.10 Sewers: regulates discharges to the sewer system, such as construction dewatering, through a permitting framework ▪ Chapter 13.20 Storm Drains and Discharges: this ordinance requires compliance with the MRP Title 15: Buildings and Construction

Plan/Policy Document	Summary
	▪ Chapter 15.05 Administrative Code: requires grading to be performed to minimize runoff, erosion, and sedimentation, and regulates grading through a permitting framework ▪ Chapter 15.45 Prevention of Flood Damage Code: designates the floodplain manager for floodplains with City jurisdiction, provides design standards for development and construction in floodplains, and requires the City's review of proposed developments in floodplains prior to approval Title 18: Zoning ▪ Chapter 18.88 Landscape Permit Provisions: provides design standards for landscape areas that minimize runoff and water consumption
City of San Jose	
Envision San Jose 2040 General Plan (2011)	The *Envision: San Jose 2040 General Plan* was adopted in 2011. The Plan establishes the following goals and policies relevant to hydrology and water resources: City Design ▪ CD-2.5: Integrate Green Building Goals and Policies of this Plan into site design to create healthful environments. Consider factors such as shaded parking areas, pedestrian connections, minimization of impervious surfaces, incorporation of stormwater treatment measures, appropriate building orientations, etc. Environmental Considerations ▪ EC-4.1: Design and build all new or remodeled habitable structures in accordance with the most recent California Building Code and municipal code requirements as amended and adopted by the City of San José, including provisions for expansive soil, and grading and storm water controls. ▪ EC-4.5: Ensure that any development activity that requires grading does not impact adjacent properties, local creeks and storm drainage systems by designing and building the site to drain properly and minimize erosion. An Erosion Control Plan is required for all private development projects that have a soil disturbance of one acre or more, are adjacent to a creek/river, and/or are located in hillside areas. Erosion Control Plans are also required for any grading occurring between October 15 and April 15. ▪ EC-4.12: Require review and approval of grading plans and erosion control plans (if applicable) prior to issuance of a grading permit by the Director of Public Works. ▪ EC-5.1: The City shall require evaluation of flood hazards prior to approval of development projects within a Federal Emergency Management Agency (FEMA) designated floodplain. Review new development and substantial improvements to existing structures to ensure it is designed to provide protection from flooding with a one percent annual chance of occurrence, commonly referred to as the “100-year” flood or whatever designated benchmark FEMA may adopt in the future. New development should also provide protection for less frequent flood events when required by the State. ▪ EC-5.2: Allow development only when adequate mitigation measures are incorporated into the project design to prevent or minimize siltation of streams, flood protection ponds, and reservoirs ▪ EC-5.3: Preserve designated floodway areas for non-urban uses. ▪ EC-5.7: Allow new urban development only when mitigation measures are incorporated into the project design to ensure that new urban runoff does not increase flood risks elsewhere.

Plan/Policy Document	Summary
	▪ EC-5.9: Work with local, regional, state and federal agencies to ensure new and existing levees provide adequate flood protection and actively partner with the Santa Clara Valley Water District and other levee owners with respect to National Flood Insurance Program (NFIP) levee recertification. ▪ EC-5.10: Encourage the preservation and restoration of urban creeks and rivers to maintain existing floodplain storage. When in-channel work is proposed, engineering techniques which include the use of plant materials (bioengineering) are encouraged. ▪ EC-5.11: Where possible, reduce the amount of impervious surfaces as a part of redevelopment and roadway improvements through the selection of materials, site planning, and street design. ▪ EC-5.12: Locate critical or public facilities (such as the Water Pollution Control Plant, local hospitals, police and fire service facilities, and schools) above the 500-year floodplain or protect such facilities up to the magnitude 500-year flood. Construction standards based on FEMA guidelines may include freeboard, elevation above the 500-year floodplain, and elevated access ramps. ▪ EC-5.13: As a part of the City's policies for addressing the effects of climate change and projected water level rise in San Francisco Bay, require evaluation of projected inundation for development projects near San Francisco Bay or at flooding risk from local waterways which discharge to San Francisco Bay. ▪ EC-5.14: Implement the requirements of FEMA relating to construction in Special Flood Hazards Areas as illustrated on Flood Insurance Rate Maps. Periodically update the City's Flood Hazard Regulations to implement FEMA requirements. ▪ EC-5.15: San José will participate in the National Flood Insurance Program (NFIP) Community Rating System (CRS). The CRS is a voluntary incentive program that recognizes and encourages community floodplain management activities that exceed minimum NFIP requirements. Flood insurance premium rates for property owners within the city may be discounted to reflect the reduced flood risk resulting from community actions meeting the three goals of the CRS, which are to reduce flood damage to insurable property; strengthen and support the insurance aspects of the NFIP; and encourage a comprehensive approach to floodplain management. ▪ EC-5.16: Implement the Post-Construction Urban Runoff Management requirements of the City's Municipal NPDES Permit to reduce urban runoff from project sites. ▪ EC-5.17: Implement the Hydromodification Management requirements of the City's Municipal NPDES Permit to manage runoff flow and volume from project sites. ▪ EC-7.5: On development and redevelopment sites, require all sources of imported fill to have adequate documentation that it is clean and free of contamination and/ or acceptable for the proposed land use considering appropriate environmental screening levels for contaminants. Disposal of groundwater from excavations on construction sites shall comply with local, regional, and state requirements. ▪ EC-7.8: Where an environmental review process identifies the presence of hazardous materials on a proposed development site, the City will ensure that feasible mitigation measures that will satisfactorily reduce impacts to human health and safety and to the environment are required of or incorporated into the projects. This applies to hazardous materials found in the soil, groundwater, soil vapor, or in existing structures. ▪ EC-7.9: Ensure coordination with the County of Santa Clara Department of Environmental Health, Regional Water Quality Control Board, Department of

Plan/Policy Document	Summary
	Toxic Substances Control or other applicable regulatory agencies, as appropriate, on projects with contaminated soil and/or groundwater or where historical or active regulatory oversight exists. ▪ EC-7.10: Require review and approval of grading, erosion control and dust control plans prior to issuance of a grading permit by the Director of Public Works on sites with known soil contamination. Construction operations shall be conducted to limit the creation and dispersion of dust and sediment runoff. Environmental Resources ▪ ER-2.2: Ensure that a 100-foot setback from riparian habitat is the standard to be achieved in all but a limited number of instances, only where no significant environmental impacts would occur. ▪ ER-8.1: Manage stormwater runoff in compliance with the City's Post-Construction Urban Runoff (6-29) and Hydromodification Management (8-14) Policies. ▪ ER-8.2: Coordinate with regional and local agencies and private landowners to plan, finance, construct, and maintain regional stormwater management facilities. ▪ ER-8.4: Assess the potential for surface water and groundwater contamination and require appropriate preventative measures when new development is proposed in areas where storm runoff will be directed into creeks upstream from groundwater recharge facilities. ▪ ER-8.5: Ensure that all development projects in San José maximize opportunities to filter, infiltrate, store and reuse or evaporate stormwater runoff onsite. ▪ ER-8.7: Encourage stormwater reuse for beneficial uses in existing infrastructure and future development through the installation of rain barrels, cisterns, or other water storage and reuse facilities. ▪ ER-8.8: Consider the characteristics and condition of the local watershed and identify opportunities for water quality improvement when developing new or updating existing development plans or policies including, but not limited to, specific or area land use plans. ▪ ER-9.1: In consultation with the Santa Clara Valley Water District, other public agencies and the SCVWDs Water Resources Protection Guidelines and Standards (2006 or as amended), restrict or carefully regulate public and private development in streamside areas so as to protect and preserve the health, function and stability of streams and stream corridors. ▪ ER-9.2: In consultation with the SCVWD restrict or carefully regulate public and private development in upland areas to prevent uncontrolled runoff that could impact the health and stability of streams. ▪ ER-9.3: Utilize water resources in a manner that does not deplete the supply of surface or groundwater or cause over drafting of the underground water basin. ▪ ER-9.5: Protect groundwater recharge areas, particularly creeks and riparian corridors. ▪ ER-9.6: Require the proper construction and monitoring of facilities that store hazardous materials in order to prevent contamination of the surface water, groundwater and underlying aquifers. In furtherance of this policy, design standards for such facilities should consider high groundwater tables and/or the potential for freshwater or tidal flooding. Infrastructure ▪ IN-3.3: Meet the water supply, sanitary sewer and storm drainage level of service objectives through an orderly process of ensuring that, before development

Plan/Policy Document	Summary
	occurs, there is adequate capacity. Coordinate with water and sewer providers to prioritize service needs for approved affordable housing projects. ▪ IN-3.7: Design new projects to minimize potential damage due to storm waters and flooding to the site and other properties. ▪ IN-3.8: In designing improvements to creeks and rivers, protect adjacent properties from flooding consistent with the best available information and standards from the Federal Emergency Management Agency (FEMA) and the California Department of Water Resources (DWR). Incorporate restoration of natural habitat into improvements where feasible. ▪ IN-3.10: Incorporate appropriate stormwater treatment measures in development projects to achieve stormwater quality and quantity standards and objectives in compliance with the City's National Pollutant Discharge Elimination System (NPDES) permit. ▪ IN-3.11: The "modified floodplain design" is the preferred design for future flood protection facilities. Use the "widen-one-bank" and "trapezoidal channel" designs only when funding or right-of-way limitations make the use of the modified flood plain design impractical. For future development, consider factors such as flooding risks, proximity to waterways, and the potential for implementing flood protection measures. Measureable Sustainability ▪ MS-3.4: Promote the use of green roofs (i.e., roofs with vegetated cover), landscape based treatment measures, pervious materials for hardscape, and other stormwater management practices to reduce water pollution. ▪ MS-3.5: Minimize areas dedicated to surface parking to reduce rainwater that comes into contact with pollutants. ▪ MS-13.3: Require subdivision designs and site planning to minimize grading and use landform grading in hillside areas. ▪ MS-13.6: Revise the grading ordinance and condition grading permits to require that graded areas be stabilized from the completion of grading to commencement of construction. ▪ MS-18.4: Retrofit existing development to improve water conservation. ▪ MS-18.12: Encourage stormwater capture and encourage, when feasible and cost effective, on-site rainwater catchment for new and existing development. ▪ MS-18.13: Encourage graywater use whenever appropriate and in areas that do not impact groundwater quality as determined through coordination with local agencies. ▪ MS-18.14: Participate in regional efforts to develop codes and standards for stormwater capture and graywater reuse, whenever feasible and cost-effective, and in areas that do not impact groundwater quality as determined through coordination with local agencies. ▪ MS-19.5: Improve the treatment of recycled water so that it can be used to help augment streams and recharge groundwater aquifers that provide a portion of the City's potable water supply. ▪ MS-20.1: Lead through advocacy with local, regional and state agencies to ensure the protection and enhancement of the quality of San José's water sources. ▪ MS-20.3: Protect groundwater as a water supply source through flood protection measures and the use of stormwater infiltration practices that protect groundwater quality. In the event percolation facilities are modified for infrastructure projects, replacement percolation capacity will be provided.

Plan/Policy Document	Summary
	▪ MS-20.4: Work with local, regional and state agencies to protect and enhance the watershed, including the protection of surface water and ground water supplies from pollution and degradation. Transportation ▪ TR-2.12: Consider alternative public right of way materials for roadway, sidewalks, park strips, crosswalks, and trails etc. to enhance the pedestrian and bicyclist experience as well as provide other benefits such as stormwater management and hydromodification control.
Tamien Station Area Specific Plan (1995)	Livable Community ▪ Goal 8: Protect people and property in the Tamien Station area from potential environmental hazards such as noise, flooding, and the impacts associated with increased traffic Land Use and Design Policies ▪ Policy 4 Riparian Corridor Development Guidelines: All new development adjacent to the Guadalupe River or its bypass channel should be consistent with the provisions of the Riparian Corridor Development Guidelines contained in the City of San Jose's Riparian Corridor Policy Study. ▪ Policy 16 Habitat Protection: The riparian habitat of the Guadalupe River and adjacent areas west of Lelong Avenue should be preserved as open space resources consistent with the Riparian Corridor Policy Study. ▪ Policy 17 Bypass Channel Design: An open channel design for the flood control bypass channel adjacent to the Elks Club site is the preferred design solution and should be implemented if the site is redeveloped. The culvert design solution should be avoided, if feasible, even if the site is not redeveloped in the near future. (The current plan proposed by the Santa Clara Valley Water District is a bypass concrete box culvert.) Implementation ▪ Policy 12 Flooding Mitigation: If new development in the Specific Plan area proceeds in advance of the implementation of the Guadalupe River Flood Control Project, the new structures within the 100-year floodplain should be constructed at elevations above the 100-year flood level. Property owners proposing new developments in the flood control improvement area may be required to dedicate land or grant easements to the Santa Clara Valley Water District for future flood control facilities. ▪ Policy 20 Storm Drainage Facilities Mitigation: New development should upgrade storm drains in Almaden Road and at the Elks Club site to current City standards. A segment of the 15-inch line between the northerly terminus of Almaden Road and Almaden Avenue/Alma Avenue intersection should be upgraded to at least a 24-inch line.
Communications Hill Specific Plan (1992)	▪ Minimize grading or re-contouring of Communications Hill to preserve the topography of the land, wherever possible, and to avoid the creation of visible cut and fill slopes or obviously engineered or flat-surfaced slopes.
San Jose Municipal Code (2017, 2018)	The San Jose Municipal Code, codified through Ordinance No. 29912, was last adopted in May 2017. The Code includes the following titles and chapters relevant to hydrology and water resources: Title 15: Public Utilities ▪ Chapter 15.11 Water Efficient Landscape Standards for New and Rehabilitated Landscaping: provides design standards for landscape areas that minimize runoff and water consumption

Plan/Policy Document	Summary
	▪ Chapter 15.14 Sewer Use Regulations: regulates discharges to the sewer system, such as construction dewatering, through a permitting framework Title 17: Buildings and Construction ▪ Chapter 17.04 Part 6 Excavation and Grading: requires grading to be performed to minimize runoff, erosion, and sedimentation, and regulates grading through a permitting framework ▪ Chapter 17.08 Special Flood Hazard Area Regulations: designates the floodplain manager for floodplains with City jurisdiction, provides design standards for development and construction in floodplains, and requires the City's review of proposed developments in floodplains prior to approval Title 20: Zoning ▪ Chapter 20.95 Storm Water Management: this ordinance requires compliance with the MRP
San Jose Council Policy 6-29 Post-construction Urban Runoff Management (2016)	The San Jose Council Policy 6-29 was approved in 1998. The policy requires specific source control BMPs for projects with the following components: a) Car Washing and Detailing Facilities b) Construction/Corporation Yards c) Automobile Dismantling and Parts Recovery d) Material Recycling Facilities (processing, transfer and large collection facilities) e) Gas Stations or Equipment Fueling f) Uncovered Parking Lots g) Loading Docks
San Jose Council Policy 8-14 Post-Construction Hydromodification Management (2016)	The San Jose Council Policy 8-14 was approved in 2010. The policy implements the requirements of the MRP for hydromodification management
City of Morgan Hill	
Morgan Hill 2035 General Plan (2016)	The *Morgan Hill 2035 General Plan* was adopted in 2016. The Plan includes the following goals and policies relevant to hydrology and water resources: Safety, Services, and Infrastructure ▪ SSI-2.6: Protect hillsides and carefully control development on steep slopes. When hillside land is developed, it should be done with minimum disruption of topography and vegetative cover. ▪ SSI-2.8: Prohibit development in areas where increased runoff from the addition of impervious surfaces and drainage would increase the probability of downslope land sliding, or where additional projects would add to the cumulative effect of increased runoff, unless a downslope drainage improvement plan has been approved ▪ SSI-5.1: Prohibit development in floodways and regulate development in floodplains to minimize flood damage and be consistent with the federal flood insurance program. ▪ SSI-5.3: Prior to the start of construction, a Flood Clearance shall be obtained from the Floodplain Administrator for the City of Morgan Hill that provides plans drawn to scale showing the nature, location, dimensions, and elevation of the area; existing or proposed structures, fill, storage of material, and drainage facilities, and floodproofing provisions. Specifically, the following information shall be required: o Proposed elevation in relation to mean sea level of the lowest floor (including basement) of all structures o Proposed elevation in relation to mean sea level to which any structure will be floodproofed. o Appropriate elevation and floodproofing certifications.

Plan/Policy Document	Summary
	○ Description of the extent to which any water course will be altered or relocated as a result of the proposed development. New residential buildings in the 100-year floodplain shall have their lowest floor elevation (excluding garage) floodproofed or raised a minimum of 1 foot above the base flood elevation (BFE). Substantially improved structures within the 100-year floodplain shall meet the same floodplain construction requirements as new buildings. ▪ SSI-5.4: Require that new developments within flood hazard areas are done in a manner that will not cause floodwaters to be diverted onto adjacent property or increase flood hazards to properties located elsewhere unless secured through a flood easement or fee title buyout. ▪ SSI-5.5: Require all local development to provide appropriate mitigation of off-site flooding impacts, including limiting runoff to predevelopment levels and/or complete solutions to flooding and local drainage problems in the vicinity of the development, using such methods as detention or retention. ▪ SSI-5.6: Consider risk of flood hazards and damage in new development proposals within flood hazard areas. Ensure that new construction is consistent with federal flood protection regulations. ▪ SSI-5.9: Restore and maintain the natural functions of riparian corridors, creeks, and channels to reduce flooding, convey stormwater flows, and improve water quality. ▪ SSI-6.3: Areas which are developed or planned for development should be protected by the construction of flood control facilities. ▪ SSI-6.6: Encourage flood management designs that respect the natural topography and vegetation of waterways while retaining dynamic flow and functional integrity. ▪ SSI-6.7: Preserve the existing floodplain capacity of urban creeks and channels. ▪ SSI-6.8: Encourage increased stormwater and flood management infrastructure capacity in order to accommodate changes in climate, precipitation, and extreme weather events. ▪ SSI-16.2: Ensure that the level of detention or retention provided on the site of any new development is compatible with the capacity of the regional storm drainage system. ▪ SSI-16.3: Require a storm water management plan for each proposed development, to be presented early in the development process and describe the design, implementation, and maintenance of the local drainage facilities. ▪ SSI-16.4: Coordinate with the Santa Clara Valley Water District to ensure compatibility of the local and regional storm drainage systems. Natural Resources and Environment ▪ NRE-5.3: Retain natural streamside and riparian areas in their natural state in order to preserve their value as percolation and recharge areas, natural habitat, scenic resources, and recreation corridors, and to stabilize banks. ▪ NRE-5.5: Where flood control projects are needed to protect existing development, minimize disruption of streams and riparian systems, maintaining slow flow and stable banks through design and other appropriate mitigation measures. ▪ NRE-5.6: Protect existing stream channels and riparian vegetation by requiring buffering or landscaped setbacks and storm runoff interception as specified in Table NRE-1.

Plan/Policy Document	Summary
	▪ NRE-6.5: Require development to be designed to conserve soil and avoid erosion. ▪ NRE-8.1: Protect water quality from contamination, and monitor it to assure that present policies and regulations are adequate. Prohibit such uses as waste facilities, septic systems, and industries using toxic chemicals where polluting substances may come in contact with groundwater, floodwaters, and creeks or reservoir waters. ▪ NRE-8.2: Continue land use policies that limit the number of individual septic systems in areas vulnerable to groundwater contamination, because of the potential for cumulative degradation of water quality. ▪ NRE-8.3: Continue to monitor groundwater and surface water quality conditions to determine if changes in regulations regarding septic systems and land use are needed. ▪ NRE-8.4: In areas where future development is expected to be served by sewers, continue large lot policies which allow minimal development and limited numbers of septic systems. (This approach increases the feasibility of designing future urban density subdivisions with smaller lots, which are more efficient for sewers in terms of service and cost.) ▪ NRE-8.6: Protect properties located in areas that have soils with rapid water percolation from future development in order to ensure existing water quality. Permit development (including commercial and industrial uses) in such areas only under strict safety limitations according to the City's Hazardous Materials Storage Ordinance section specifically related to high percolation rates. ▪ NRE-8.7: In order to provide greater protection of the aquifers which supply drinking water to the South County, give special consideration to the management of contaminants (e.g., hazardous materials, sanitary effluents) in groundwater recharge areas where no protective aquitard layer exists. ▪ NRE-8.8: Implement Best Management Practices to improve water quality, in conformance with the South Santa Clara County and City of Morgan Hill Total Maximum Daily Load (TMDL) Monitoring Plan for the Pajaro River Watershed (2015) and findings in subsequent annual status updates, as required for compliance with community standards and applicable State and federal provisions. ▪ NRE-12.4: Require subdivision designs and site planning to minimize grading and use landform grading in hillside areas.
Morgan Hill Downtown Specific Plan (2009)	▪ Storm Drainage System Projections and Improvements – The City's Storm Drain Master Plan does not call for any improvements to the existing storm drain system in Downtown, except for the Upper Llagas Creek Flood Protection Project (also known as PL566). PL566 is intended to provide flood protection for the Cities of Gilroy and Morgan Hill and the unincorporated portion of Santa Clara County known as San Martin. The project will consist of a series of channels, box culverts, and bridges designed to protect the floodplain from a one-percent flood. ▪ Floodplain Regulations – Development within the floodplain is required to comply with the Flood Damage Prevention ordinance (Chapter 18.42), which provides various standards for construction, subdivisions, utilities, and other issues. Standards for new developments include, but are not limited to: anchoring building structures; using appropriate materials; flood-proofing commercial buildings; providing drainage paths; elevating residential structures; and designing utilities to minimize infiltration of floodways.

Plan/Policy Document	Summary
Morgan Hill Station Area Master Plan (2018)	Streetscape and Placemaking ▪ Toolkit for Buffer Areas Strategy A – Planted Bulb-outs at Intersections: As part of its Placemaking Strategy, the City has installed bulb-outs at Monterey Road intersections. As further improvements to Monterey Road are considered, the City could contemplate further extending bulb-outs at intersections all the way to the edge of the travel lane. Doing so would further enhance the bulb-out's contribution to traffic calming and increase the reduction in pedestrian crossing distances. The City could also consider installing green infrastructure elements, such as bioretention planters, in retrofitted existing planted bulb-outs or potential new bulb-outs.
Morgan Hill Municipal Code (2016, 2018)	The Morgan Hill Municipal Code was published in 1987. The Code includes the following titles and chapters relevant to hydrology and water resources: Title 13: Public Services ▪ Chapter 13.30 – Urban Storm Water Quality Management and Discharge Control: this ordinance requires compliance with the SWRCB NPDES Permit Title 15: Buildings and Construction ▪ Chapter 15.08 – Building Code: requires grading to be performed to minimize runoff, erosion, and sedimentation, and regulates grading through a permitting framework Title 17: Subdivisions ▪ Chapter 17.32 – Improvements and Improvement Agreements: this ordinance requires stormwater runoff to be collected and conveyed by an approved storm drain system Title 18: Zoning ▪ Chapter 18.42 – Flood Damage Prevention: this ordinance requires flood damage prevention/protection measures for development/redevelopment within flood hazard areas ▪ Chapter 18.71 – Post Construction Stormwater Pollution Prevention: this ordinance requires compliance with stormwater BMPs listed in the CASQA handbook and manuals from the City of Morgan Hill ▪ Chapter 18.73 – Water Conservation in Landscaping: provides design standards for landscape areas that minimize runoff and water consumption
City of Gilroy	
City of Gilroy 2002–2020 General Plan (2002)	The *City of Gilroy 2002-2020 General Plan* was adopted in 2002. The Plan includes the following goals and policies relevant to hydrology and water resources: ▪ 1.16: Minimize the amount of grading and topographical alteration needed in hillside development to create developments that appear to be in a natural setting, sited in the least obtrusive fashion as a compatible rather than as an imposed scheme. Clustered development in hillside areas should be encouraged. Also, design roadways that pass through hillside areas to preserve the ecological and scenic character of the hillsides. ▪ 19.01: Work with the Santa Clara Valley Water District to ensure that water demand created by new development does not exceed the groundwater supply that can be economically and legally withdrawn from the aquifer on a sustained basis. Restrict groundwater pumping to rates that will not impair groundwater quality or create other environmental damage, such as subsidence. ▪ 19.09: Provide and maintain a system of storm drains to protect areas of development from localized flooding.

Plan/Policy Document	Summary
	▪ 20.02: Protect the ecological, aesthetic and recreational value of the creeks that flow through the Gilroy Planning Area from urban encroachment and degradation. Ensure that new development preserves the function of natural drainages, including small canyons and seasonal creeks. The easements and setbacks adjacent to these creeks shall be maintained in open space. Access to creeks should be of sufficient width to accommodate trails, flood control access, and protection of riparian habitat. ▪ 22.03: Prohibit development of waste facilities, septic systems, and industries using toxic chemicals in areas where polluting substances may come in contact with groundwater, floodwaters, creeks, or reservoir waters. Within the Gilroy Planning Area, identify land uses that may contribute to the degradation of groundwater quality and ensure adequate monitoring, controls and enforcement to protect groundwater quality. ▪ 22.09: Restrict development on properties that have soils with "rapid water percolation" to protect water quality. Commercial and industrial developments in such areas shall only be permitted under the strict safety limitations required by the City's and/or County's Hazardous Materials Specialists. ▪ 22.10: To provide greater protection of the aquifers that supply drinking water to South County, give special consideration to the management of contaminants (e.g., hazardous materials, sanitary effluents) in groundwater recharge areas where no protective aquitard layer exists. ▪ 25.01: Permit development only in those areas where potential danger to the health, safety, and welfare of residents can be adequately mitigated to an "acceptable level of risk" (see Policy 25.04). This applies to development in areas subject to flood damage or geological hazard due to their location and/or design. Development should be prohibited in areas where emergency services, including fire protection, cannot be provided. ▪ 25.04: Enact development controls to ensure "an acceptable level of risk" in those areas where life and property are subject to seismic, geologic, and flooding hazards. "Acceptable risk" in this instance describes the level of risk that the majority of citizens will accept without expecting governmental action to provide protection. This definition considers acceptable risk only from the point of view of the public agency; individual concepts of acceptable risk may vary widely. Levels of acceptable risk and damage related to kind of facility and occupancy are presented in Figure 8-1. ▪ 25.17: Work closely with the Santa Clara Valley Water District to alleviate flooding and drainage problems in the Planning Area, ensuring that new flood control measures are designed and implemented in accordance "Best Management Practices (BMPs) and in keeping with the goals and policies of the General Plan. ▪ 25.18: Restrict urban development and expansion in areas prone to flooding (as indicated on the Flood Hazards Map) or on properties where drainage problems or saturated soil conditions create flood hazards. Allow development in such areas only if measures are enacted to reduce these hazards to an acceptable level of risk. ▪ 25.19: Discourage the construction of expensive flood prevention facilities by leaving high-risk floodways in agricultural and recreational uses. ▪ 25.20: Minimize the long-term public costs of flood control improvements and mitigate potential adverse environmental impacts. Also, ensure that measures to reduce flood damage to individual properties do not increase erosion and/or flood hazards on other properties.

Plan/Policy Document	Summary
	▪ 25.21: Design flood control measures and drainage channel improvements as part of an overall community improvement program with provision for multiple use, including recreational open space, trails, bikeways, groundwater recharge, protection and restoration of riparian vegetation and wildlife habitats, and enhancement of scenic qualities. ▪ 25.22: Design new drainage channels with gently sloping and curving banks to maximize safety, ease of maintenance, and natural appearance. To the greatest extent feasible, use riparian vegetation to stabilize the banks and to landscape the channels in a manner that is natural in character and easy to maintain, creating a scenic asset for the enjoyment of City residents. ▪ 25.23: Require new development to include green areas for reducing runoff and increasing runoff absorption capacities. Similarly, encourage the removal of pavement that is not directly serve traffic parking needs; maintain unpaved parkways between sidewalks and streets; encourage the use of permeable paving materials; and require the use of landscaped strips and islands to break-up large paved areas. ▪ 25.24: Require new developments in hillside areas to retain and protect areas of native vegetation to help reduce erosion and slow the speed of rainfall runoff, thereby retaining the hillside areas' natural flood control characteristics. Ensure that retention and protection of vegetated areas is also in keeping with fire hazard management goals.
Downtown Specific Plan (2005)	IV Design Guidelines, C Project Landscape and Hardscape ▪ Existing trees in good health and appearance should be preserved if possible. ▪ Urban runoff can be greatly reduced by diverting stormwater from impervious areas such as roofs and paths to landscaped areas and infiltration basins where water can seep into the ground. VI Streetscape Beautification and Public Improvements, Sidewalks ▪ Extensions of the sidewalk into the roadway at crosswalks are called "bulbouts" or "curb extensions." Designed to give pedestrians greater visibility as they approach the crossing, bulbouts decrease the distance users must cross as well as slow traffic. Sidewalk bulb-outs shall be used where feasible considering the requirements of traffic volumes and specific storm drainage conditions.
Gilroy Municipal Code (2016, 2018)	The Gilroy Municipal Code is current through Ordinance 2017-03, passed in 2017. The Code includes the following chapters relevant to hydrology and water resources: Chapter 6: Buildings ▪ Requires grading to be performed to minimize runoff, erosion, and sedimentation, and regulates grading through a permitting framework Chapter 27: Water ▪ Chapter 27a Water Resources Protection: setbacks for stream channels is 50 feet from the top of the bank or edge of the riparian corridor, whichever is greater ▪ Chapter 27c Municipal Storm Water Quality Protection and Discharge Control: this ordinance requires compliance from the SWRCB NPDES Permit ▪ Chapter 27d Post Construction Storm Water Pollution Prevention: this ordinance requires compliance with stormwater BMPs listed in the CASQA handbook and manuals from the City of Gilroy ▪ Chapter 27e Floodplain Management: requires flood damage prevention/protection measures for development/redevelopment within flood hazard areas.

Plan/Policy Document	Summary
	Chapter 30: Zoning Ordinance ▪ Chapter 30 Article XXXVIII Landscaping: provides design standards for landscape areas that minimize runoff and water consumption
San Benito County	
San Benito County 2035 General Plan (2015)	The *San Benito County 2035 General Plan* was adopted in 2015. The Plan includes the following goals and policies relevant to hydrology and water resources: Land Use ▪ LU-1.8: The County shall require all submitted site plans, tentative maps, and parcel maps to depict all environmentally sensitive and hazardous areas, including: 100-year floodplains, fault zones, 30 percent or greater slopes, severe erosion hazards, fire hazards, wetlands, and riparian habitats. ▪ LU-1.10: The County shall encourage specific development sites to avoid natural and manmade hazards, including, but not limited to, active seismic faults, landslides, slopes greater than 30 percent, and floodplains. Development sites shall also be on soil suitable for building and maintaining well and septic systems (i.e., avoid impervious soils, high percolation or high groundwater areas, and provide setbacks from creeks). The County shall require adequate mitigation for any development located on environmentally sensitive lands (e.g., wetlands, erodible soil, archaeological resources, important plant and animal communities). Circulation ▪ C-1.19: The County shall ensure that road development is minimized in hazardous areas (e.g. faults, flood plains, landslide areas, fire hazard areas) and that, if a hazard is present within a planned road alignment, the planned alignment is modified to the extent feasible to avoid the hazard. Public Facilities and Services ▪ PFS-3.5: The County shall support plans to develop new reliable future sources of supply, including, but not limited to, the expansion of surface water storage and conjunctive use of surface water and groundwater, while promoting water conservation and water recycling/reuse. ▪ PFS-3.8: The County shall support and participate in the integrated management of surface water and groundwater resources, wastewater, stormwater treatment and use, and the use of reclaimed water. ▪ PFS-6.1: The County shall require that stormwater drainage facilities are properly designed, sited, constructed, and maintained to efficiently capture and dispose of runoff and minimize impacts to water quality. ▪ PFS-6.2: The County shall require best management practices in the development, upgrading, and maintenance of stormwater facilities and services to reduce pollutants from entering natural water bodies while allowing stormwater reuse and groundwater recharge. ▪ PFS-6.3: The County shall encourage the use of natural stormwater drainage systems (e.g., swales, streams) to preserve and enhance the environment and facilitate groundwater recharge. ▪ PFS-6.4: The County shall require project designs that minimize stormwater drainage concentrations and impervious surfaces, complement groundwater recharge, avoid floodplain areas, and use natural watercourses in ways that maintain natural watershed functions and provide wildlife habitat. ▪ PFS-6.5: Where necessary, the County shall require on-site detention/retention facilities and/or velocity reducers to maintain pre-development runoff flows and velocities in natural drainage systems.

Plan/Policy Document	Summary
	▪ PFS-6.6: The County shall require stormwater detention basins be designed to ensure public safety, be visually unobtrusive, provide temporary or permanent wildlife habitat, and where feasible, provide recreation opportunities. ▪ PFS-6.7: The County shall require all drainage systems in new development and redevelopment to comply with applicable State and Federal non-point source pollutant discharge requirements. ▪ PFS-6.8: The County shall ensure that drainage systems are designed and maintained to minimize soil erosion and sedimentation and maintain natural watershed functions. Natural and Cultural Resources ▪ NCR-2.5: The County shall encourage the protection of the habitat value and biological functions of oak woodlands, native grasslands, riparian and aquatic resources, and vernal pools and wetlands. The County shall require that development avoid encroachment and require buffers around these habitats to the extent practicable. The County shall further require mitigation for any development proposals that have the potential to reduce these habitats. Recreational trails and other features established within natural wetlands and aquatic and riparian buffer areas shall be, as long as such areas are not required to meet the Americans with Disabilities Act, located along the outside of the sensitive habitat whenever possible to minimize intrusions and maintain the integrity of the habitat. Exceptions to this action include irrigation pumps, roads and bridges, levees, docks, public boat ramps, and similar uses. In all cases where intrusions into these buffers are made, only the minimum amount of vegetation necessary to construct the feature shall be removed. ▪ NCR-4.1: The County shall consider implementing Regional Water Quality Control Board Basin Plan policies to improve areas of low water quality, maintain water quality on all drainage, and protect and enhance habitat for fish and other wildlife on major tributaries to the Pajaro River (San Benito River, Pacheco Creek) and the Silver Creek watershed. ▪ NCR-4.5: The County shall encourage new development to preserve, where feasible, areas that provide important groundwater recharge and stormwater management benefits such as undeveloped open spaces, natural habitat, riparian corridors, wetlands, and natural drainage areas. ▪ NCR-4.6: To ensure an adequate water supply, large-scale development projects that meet the criteria in California Water Code section 10912 shall prepare an analysis of the sufficiency of the groundwater from the basin or basins from which the proposed project will be supplied to meet the projected water demand associated with the proposed project in accordance with SB 610. ▪ NCR-4.7: The County shall encourage new development to avoid significant water quality impacts and protect the quality of water resources and natural drainage systems through site design, source controls, runoff reduction measures, and best management practices (BMPs). Health and Safety ▪ HS-1.14: The County shall discourage development in areas that may be more severely impacted by climate change, including areas at high risk of wildfire or flooding, unless proper design mitigation is included in the project. ▪ HS-2.1: The County shall require a minimum 100-year flood protection for all new development in accordance with local, State, and Federal requirements to avoid or minimize the risk of flood damage.

Plan/Policy Document	Summary
	▪ HS-2.2: The County shall encourage, to the extent feasible, new development located in dam inundation areas to consider and mitigate the risks from dam failure. ▪ HS-2.3: The County shall require new flood control projects or developments within areas subject to 100 year floods to be constructed in a manner that will not cause floodwaters to be diverted onto adjacent property or increase flood hazards to property downstream. ▪ HS-2.4: The County shall coordinate with local, regional, State, and Federal agencies to define existing and potential flood problem areas associated with expected impacts from climate change and develop and implement strategies to improve and maintain flood control facilities accordingly. ▪ HS-2.5: The County shall ensure that the upgrade, expansion, or construction of any flood control facilities will not adversely divert flood water or increase flooding. ▪ HS-2.6: The County shall encourage multi-purpose flood control facilities that incorporate recreation, resource conservation, preservation of natural riparian habitat, and scenic values of the county's streams, creeks, rivers, and lakes. ▪ HS-2.7: The County shall prohibit further channeling, straightening, or lining of waterways until alternative multi-purpose modes of flood control, such as wider berms and landscaped levees, in combination with recreation amenities, are studied. ▪ HS-2.8: The County shall encourage flood control facility designs that retail natural contours and vegetation of waterways, while retaining dynamic flow and functional integrity. ▪ HS-2.9: The County shall ensure that flood control facilities are designed and maintained to minimize soil erosion and sedimentation and maintain natural watershed functions.
San Benito County Ordinance Code (2016, 2018)	The San Benito County Ordinance Code, codified through Ordinance 937, was most recently adopted in 2015. The Code includes the following titles and chapters relevant to hydrology and water resources: Title 15: Public Works ▪ Chapter 15.05: Water: require groundwater aquifer protection from groundwater extraction and permits for excavations that may intersect groundwater basins Title 19: Land Use and Environmental Regulations ▪ Chapter 19.15: Flood Damage Protection: requires flood damage prevention/protection measures for development/redevelopment within flood hazard areas ▪ Chapter 19.17: Grading, Drainage and Erosion Control: grading must be done at least 50 from the top of the bank of a stream creek, river or from a wetland or body of water and grading to be performed to minimize runoff, erosion, and sedimentation, and regulates grading through a permitting framework Title 23: Subdivisions ▪ Chapter 23.17: Improvements: this ordinance requires stormwater runoff to be collected and conveyed by an approved storm drain system ▪ Chapter 23.31: Improvement Designs Article III Storm Drainage Design Standards: design requirements for storm new/improved storm drainage systems
Merced County	
2030 Merced County General Plan (2013)	The *2030 Merced County General Plan* was adopted in 2013. The Plan includes the following goals and policies relevant to hydrology and water resources:

Plan/Policy Document	Summary
	Public Facilities and Services ▪ PFS-2.5: Prohibit wastewater disposal facilities, including private residential facilities, that are determined to have the potential to contaminate the groundwater or surface water, on either a site-specific or cumulative basis. ▪ PFS-3.2: Require that new development in unincorporated communities includes adequate stormwater drainage systems. This includes adequate capture, transport, and detention/retention of stormwater. ▪ PFS-3.3: Encourage development of community drainage systems rather than individual project level systems, in order to use land more efficiently and project people, property and the environment in a more comprehensive manner. ▪ PFS-3.4: Coordinate with the U.S. Army Corps of Engineers and other appropriate agencies to develop stormwater detention/retention facilities and recharge facilities that enhance flood protection and improve groundwater recharge. ▪ PFS-3.5: Require on-site detention/retention facilities and velocity reducers when necessary to maintain pre-development storm flows and velocities in natural drainage systems. ▪ PFS-3.6: Encourage stormwater detention/retention project designs that minimize drainage concentrations and impervious coverage, avoid floodplain areas, are visually unobtrusive and, where feasible, provide a natural watercourse appearance and a secondary use, such as recreation. Natural Resources ▪ NR-1.4: Minimize the removal of vegetative resources which stabilize slopes, reduce surface water runoff, erosion, and sedimentation. ▪ NR-1.13: Require an appropriate setback, to be determined during the development review process, for developed and agricultural uses from the delineated edges of wetlands. ▪ NR-3.1: Protect soil resources from erosion, contamination, and other effects that substantially reduce their value or lead to the creation of hazards. ▪ NR-3.2: Require minimal disturbance of vegetation during construction to improve soil stability, reduce erosion, and improve stormwater quality. ▪ NR-3.3: Encourage landowners to participate in programs that reduce soil erosion and increase soil productivity. This shall include promoting and coordinating the efforts of University of California Cooperative Extension, various Resource Conservation Districts, and other similar agencies and organizations. ▪ NR-3.15: Within all areas designated for urban land uses by the 2030 General Plan, all structures, paving, or grading shall be set back from rivers, creeks, channels or other major waterways at least twenty feet from the top of bank or twenty feet plus twice the channel depth measured from the toe of the near embankment, whichever is greater, unless a greater setback is required by state or federal regulation Health and Safety ▪ HS-1.7: Discourage construction and grading on slopes in excess of 30 percent. ▪ HS-2.1: Prepare and adopt a floodplain management program in flood hazard areas that gives priority to regulation of land uses over development of structural controls as a method of reducing flood damage. ▪ HS-2.6: Prohibit new development in existing undeveloped areas (i.e., area devoted to agriculture or open space that is not designated for development) protected by a State flood control project without appropriately considering significant known flooding risks and taking reasonable and feasible action to

Plan/Policy Document	Summary
	mitigate the potential property damage to the new development resulting from a flood. ▪ HS-2.7: The County shall not enter into a development agreement, approve any building permit or entitlement, or approve a tentative or parcel map unless it finds one of the following: a) The flood control facilities provides 200-year level of protection in urban and non-urban areas consistent with the current Central Valley Flood Protection Plan; b) Conditions imposed on the development will protect the property at a 200-year level of protection in urban and non-urban areas consistent with the current Central Valley Flood Protection Plan; or c) The local flood management agency has made "adequate progress" on the construction of a flood protection system which will result in protection equal or greater than the 200-year flood event in urban and non-urban areas consistent with the current Central Valley Flood Protection Plan. ▪ HS-2.8: Require new flood control projects or developments within areas subject to 100- and 200-year frequency floods are done in a manner that will not cause floodwaters to be diverted onto adjacent property or increase flood hazards to property located elsewhere. ▪ HS-2.9: Encourage all agencies that operate public facilities, such as roads, structures, wastewater treatment plants, gas, electrical, and water systems within areas subject to 100- and 200-year frequency floods to locate and construct facilities to minimize or eliminate potential flood damage. ▪ HS-2.10: Prohibit the construction of essential facilities (including hospitals, healthcare facilities, emergency shelters, fire stations, emergency command centers, and emergency communications facilities) in the 100- and 200-year floodplain, unless it can be demonstrated that the structural and operational integrity of the facility can be maintained during flood events. ▪ HS-2.14: Encourage multi-purpose flood control projects that incorporate recreation, resource conservation, preservation of natural riparian habitat, and scenic values of the County's streams, creeks, and lakes. ▪ HS-2.15: Encourage flood control designs that respect the natural topography and vegetation of waterways while retaining dynamic flow and functional integrity. ▪ HS-2.16: Encourage increased stormwater and flood protection infrastructure capacity in order to accommodate changes in precipitation and extreme weather events. ▪ HS-2.17: Permit the construction of County flood control facilities in existing developments located within flood hazard areas to proceed only after a complete review of the environmental effects and project costs and benefits. ▪ HS-6.1: Development Restrictions in High Risk Areas (RDR) • Prohibit development in areas that may be more severely impacted by climate change, including areas at high risk of wildfire or flooding, unless proper design mitigation is included in the project. Water ▪ W-1.4: Support implementation of groundwater recharge projects consistent with adopted Integrated Regional Water Management Plans to minimize overdraft of groundwater and ensure the long-term availability of groundwater. ▪ W-2.1: Ensure that land uses and development on or near water resources will not impair the quality or productive capacity of these water resources. ▪ W-2.2: Prepare updated development regulations, such as best management practices, that prevent adverse effects on water resources from construction and development activities.

Plan/Policy Document	Summary
	▪ W-2.3: Encourage the use of natural channels for drainage and flood control to benefit water quality and other natural resource values. ▪ W-2.4: Encourage agriculture and urban practices to comply with the requirements of the Regional Water Quality Control Board for irrigated lands and confined animal facilities, which mandate agricultural practices that minimize erosion and the generation of contaminated runoff to ground or surface waters by providing assistance and incentives. ▪ W-2.5: Enforce septic tank and onsite system regulations of the Regional Water Quality Control Board to protect the water quality of surface water bodies and groundwater quality. ▪ W-2.7: Monitor and enforce provisions of the U.S. Environmental Protection Agency National Pollution Discharge Elimination System (NPDES) program to control non-point source water pollution. ▪ W-2.8: Coordinate with the State Water Resources Control Board, Regional Water Quality Control Board, and other responsible agencies to ensure that sources of water contamination (including boron, salt, selenium and other trace element concentrations) do not enter agricultural or domestic water supplies, and will be reduced where water quality is already affected. ▪ W-4.1: Protect watersheds, aquifer recharge areas, and areas susceptible to ground and surface water contamination by identifying such areas, and implementing requirements for their protection such as: o Implement zoning and development regulations to protect water resources, including aquifer recharge areas and areas susceptible to ground and surface water contamination; o For new development, and when adopting new Community Plans, require community drainage systems that incorporate on-site infiltration and contaminant control measures that are compatible with the County SWMP and NPDES regulations for post-construction runoff conditions; and o Cooperate with other agencies and entities with responsibilities for water quality and watershed protection.
Merced County Code (2016, 2018)	The Merced County Ordinance Code, codified through Ordinance No. 2472, was most recently passed in February 2017. The Code includes the following chapters relevant to hydrology and water resources: Title 9: Public Peace, Morals, and Welfare ▪ Chapter 9.53 Regulation of Stormwater: this ordinance requires compliance from the SWRCB NPDES Permit and the CASQA handbooks ▪ Title 16: Building and Construction ▪ Chapter 16.18.010 California Residential Building Code Adopted: requires grading to be performed to minimize runoff, erosion, and sedimentation and regulates grading through a permitting framework. Title 18: Subdivisions ▪ Chapter 18.34 Special Flood Hazard Areas: requires flood damage prevention/protection measures for development/redevelopment within flood hazard areas ▪ Chapter 18.38 Landscape Standards: provides design standards for landscape areas that minimize runoff and water consumption

Geology, Soils, and Seismicity

Table 8 Regional and Local Plans and Policies Relevant to Geology, Soils, and Seismicity

Plans and Policies	Summary
County of Santa Clara	
Santa Clara County Geologic Ordinance (2002)	Chapter IV Geologic Provisions, adopted in March 2002, establishes requirements for geologic evaluation of projects based on proposed land use and adopted official County Geologic Hazard Maps. The ordinance establishes requirements, rules, and regulations for the development of land that is on or adjacent to known potentially hazardous areas. The geologic investigation would be reviewed and approved by the county geologist prior to any project approval.
Santa Clara County Grading and Drainage Ordinance (2013)	Chapter III Grading and Drainage, effective in May 2013, establishes minimum standards for grading projects in order to control erosion and the production of sediment, as well as to control other related environmental damage such as destabilization and/or scarring of hillsides.
Santa Clara County General Plan (1994)	The *Santa Clara County General Plan* was adopted in 1994. The following polices from the Safety and Noise section are relevant to the project: ▪ Policy C-HS 28: Countywide strategies for reducing the threat of natural hazards to life and property should include: (a) Inventory hazards and monitor changing conditions; (b) Minimize the resident population within high hazard areas; (c) Design, locate, and regulate development within high hazard areas; (d) Reduce the magnitude of the hazard, if feasible; (e) Provide public information regarding natural hazards. ▪ Policy C-HS 29: Inventories and mapping of natural hazards shall be adequately maintained for use in planning and decision-making. ▪ Policy C-HS 33: Development in areas of natural hazards should be designed, located, and otherwise regulated to reduce associated risks, by regulating the type, density, and placement of development where it will not: (a) be directly jeopardized by hazards; (b) increase hazard potential; and (c) increase risks to neighboring properties.

Plans and Policies	Summary
City of Santa Clara	
City of Santa Clara 2010-2035 General Plan (2010)	The *City of Santa Clara 2010-2035 General Plan* was adopted in November 2010. The following goals and policies are relevant to the project: ▪ 5.10.5-G1 Protection of life, the environment and property from natural catastrophes and man-made hazards. ▪ 5.10.5-P5 Regulate development, including remodeling or structural rehabilitation, to ensure adequate mitigation of safety hazards, including flooding, seismic, erosion, liquefaction and subsidence dangers. ▪ 5.10.5-P6 Require that new development is designed to meet current safety standards and implement appropriate building codes to reduce risks associated with geologic conditions. ▪ 5.10.5-P7 Implement all recommendations and design solutions identified in project soils reports to reduce potential adverse effects associated with unstable soils or seismic hazards. ▪ 5.10.5-P16 Require new development to implement erosion and sedimentation control measures to maintain an operational drainage system, preserve drainage capacity and protect water quality. ▪ 5.10.5-P17 Require that grading and other construction activities comply with the Association of Bay Area Governments' Manual of Standards for Erosion and Sediment Control Measures and with the CASQA, Stormwater Best Management Practice Handbook for Construction.
City of San Jose	
San Jose 2040 General Plan (2011)	The *San Jose 2040 General Plan* was adopted in 2011. The following goals and policies are relevant to the project: ▪ Goal EC-3: Seismic Hazards: Minimize the risk of injury, loss of life, property damage, and community disruption from seismic shaking, fault rupture, ground failure (liquefaction and lateral spreading), earthquake-induced landslides, and other earthquake-induced ground deformation. ▪ Policy EC-3.5: Locate, design, and construct vital public utilities, communication infrastructure, and transportation facilities in a manner that maximizes risk reduction and functionality during and after an earthquake. ▪ Goal: EC-4: Geologic and Soil Hazards: Minimize the risk of injury, loss of life, and property damage from soil and slope instability including landslides, differential settlement, and accelerated erosion. ▪ Policy EC-4.5: Ensure that any development activity that requires grading does not impact adjacent properties, local creeks and storm drainage systems by designing and building the site to drain properly and minimize erosion. An Erosion Control Plan is required for all private development projects that have a soil disturbance of one acre or more, are adjacent to a creek/river, and/or are located in hillside areas. Erosion Control Plans are also required for any grading occurring between October 15 and April 15. ▪ Policy EC-4.6: Evaluate development proposed in areas with soils containing naturally occurring asbestos (i.e., serpentinite) that would require ground disturbance and/or development of new residential or other sensitive uses, for risks to people from airborne asbestos particles during construction and post-construction periods. Hazards shall be assessed, at minimum, using guidelines and regulations of the Bay Area Air Quality Management District and the California Air Resources Board.

Plans and Policies	Summary
City of Morgan Hill	
Morgan Hill 2035 General Plan (2016)	The *Morgan Hill 2035 General Plan* was adopted in 2016. The following goals and policies are relevant to the project: ▪ Goal SSI-2: Reduction of potential harm to persons or property from geologic/seismic hazards. ▪ Policy SSI-2.1: Hillside Development. Protect hillsides and carefully control development on steep slopes. When hillside land is developed, it should be done with minimum disruption of topography and vegetative cover. ▪ Policy SSI-2.7: Landslides. Prohibit development on known active landslides and limit development in areas where such development might initiate sliding or be affected by sliding on adjacent parcels. ▪ Policy SSI-2.8: Runoff and Slope Stability. Prohibit development on known active landslides and limit development in areas where such development might initiate sliding or be affected by sliding on adjacent parcels. ▪ Policy SSI-2.10: Slope Stability. Enforce and maintain strict grading and building regulations to minimize instability of sloping areas and reduce public costs associated with maintaining roads and utilities on unstable slopes. ▪ Policy SSI-2.11: Geotechnical Investigations. Require geotechnical investigations on all projects in unstable areas, including areas of expansive soils, prior to construction to ensure that the potential hazards are identified and can be properly mitigated.
City of Gilroy	
City of Gilroy 2002-2020 General Plan (2002)	▪ Natural Hazards Goals: (a) Minimal potential for loss of life, injury, damage to property, economic and social dislocation, and unusual public expense due to natural hazards; (b) Development and use controls to protect the public from the risk of flood damage and to minimize hazards posed by fire, seismic activity, geologic instability, soil erosion, weak and expansive soils, and potentially hazardous soils materials. ▪ Policy 25.01: Location of Future Development. Permit development only in those areas where potential danger to the health, safety, and welfare of residents can be adequately mitigated to an “acceptable level of risk”. This applies to development in areas subject to flood damage or geological hazard due to their location and/or design. Development should be prohibited in areas where emergency services, including fire protection, cannot be provided. ▪ Policy 25.08: Structural Standards. Assure that structures for human occupancy are designed and constructed to retain their structural integrity when subjected to seismic activity in accordance with the Uniform Building Code of the State of California. ▪ Policy 25.09: Site Investigation and Mitigation. Ensure proper site investigations and appropriate mitigation for development proposals in areas of unconsolidated fill, in former streambeds, and in areas subject to seasonal high groundwater tables. Site and building design and engineering must minimize potential damage to an “acceptable level of risk” from hazards posed by liquefaction, differential settlement, and severe ground shaking. ▪ Policy 25.11: Slope Restrictions. Restrict development on steep slopes and on slopes susceptible to landslides and soil creep. Slopes of 10 to 30 percent may be suitable for low intensity, low density development, subject to site-specific review and approval. Slopes greater than 30 percent, areas of high landslide risk, and areas with highly expansive soils on slopes greater than 10 percent are not suitable for development and will remain open space.

Plans and Policies	Summary
City of Gilroy General Guidelines (2014)	The City requires that complete grading plans be prepared that illustrate all proposed cuts-and-fills (Ord. No. 85-15, 2, 8-19-85) and a geotechnical report that examines the property of all phases prior to development.
San Benito County	
San Benito County 2035 General Plan (2015)	The *San Benito County 2035 General Plan* was adopted in 2015. The following goals and policies are relevant to the project: ▪ Goal HS-3: To protect lives and property from seismic and geologic hazards. ▪ Policy HS-3.2: Subsidence or Liquefaction. The County shall require that all proposed structures, utilities, or public facilities with recognized near-surface subsidence or liquefaction areas be located and constructed in a manner that minimizes or eliminates potential damage. It is County policy to minimize erosion resulting from grading, cutting, and filling. The County requires a geotechnical report and grading plans prior to development.
Merced County	
2030 Merced County General Plan (2013)	Merced County adopted the *2030 Merced County General Plan* on December 10, 2013. The general plan includes the following goals and policies: ▪ Health and Safety Element Goal HS-1: Minimize the loss of life, injury, and property damage of County residents due to seismic and geologic hazards. ▪ Policy HS-1.1: Require that all new habitable structures be located and designed in compliance with the Alquist-Priolo Special Studies Zone Act and related State earthquake legislation. ▪ Policies HS-1.6, HS-1.7, HS-1.8, and HS-1.9 related to construction on unstable soils address unstable soils, slope instability, and landslides. ▪ Natural Resources Element Goal NR-3: Facilitate orderly development and extraction of mineral resources while preserving open space, natural resources, and soil resources and avoiding or mitigating significant adverse impacts. ▪ Policy NR-3.1: Protect soil resources from erosion, contamination, and other effects that substantially reduce their value or lead to the creation of hazards. ▪ Policy NR-3.2 addresses soil erosion and soil stability.
Merced County Code (2017)	The Merced County Code is current through Ordinance No. and the June 2017 code supplement. ▪ 16.16.010 International Building Code: The International Building Code, 2012 Edition, the Standards referenced in Chapter 35 and all Appendix Chapters, as adopted by the International Code Council, and California State Amendments to the code, are hereby adopted by reference and, except as herein otherwise provided, are applicable to and shall cover all construction within the unincorporated area of the county of Merced. ▪ 18.41 Performance Standards: The Merced County Code, Chapter 18.41, establishes performance standards to make sure there is compatibility between land uses by setting limits. It includes provisions for clearing, grading, earth moving, and other site preparation activities during construction.

Paleontological Resources

Table 9 Regional and Local Plans and Policies Relevant to Paleontological Resources

Plans and Policies	Summary
County of Santa Clara	
County of Santa Clara General Plan (1994)	The County of Santa Clara General Plan recognizes paleontological sites as having scientific value and the potential to increase our knowledge of the natural world, and has a goal (Goal 5.1) to protect and preserve paleontological resources. ▪ Policies C-RC 49 and R-RC 81 state that heritage resources, which includes paleontological resources, within Santa Clara County and within rural unincorporated areas should be preserved. ▪ Policies C-RC 50 and R-RC 82 provide a countywide general approach to heritage resource protection, which involves: (1) inventory and evaluation of heritage resources, (2) prevention or minimization of adverse impacts on heritage, and (3) restoration, enhancement, and commemoration of resources as appropriate. ▪ Additional policies and recommendations set the guidance by which the general approach is to be implemented (Policies C-RC 51 through C-RC 56 and R-RC 83 through R-RC 94; Implementation Recommendations C-RC(i) 24 through C-RC(i) 29 and R-RC(i) 32 through R-RC(i) 34).
City of Santa Clara	
City of Santa Clara General Plan (2010)	The City of Santa Clara General Plan has two goals and four policies to protect paleontological resources. ▪ Goal 5.6.3-G1: Protection and preservation of cultural resources, as well as archaeological and paleontological sites. ▪ Goal 5.6.3-G2: Appropriate mitigation in the event that human remains, archaeological resources, or paleontological resources are discovered during construction activities. ▪ Policy 5.6.3-P1: Require that new development avoid or reduce potential impacts to archaeological, paleontological and cultural sites. ▪ Policy 5.6.3-P2: Encourage salvage and preservation of scientifically valuable paleontological or archaeological materials. ▪ Policy 5.6.3-P4: Require that a paleontologist/archaeologist monitor all grading and/or excavation if there is a potential to affect archaeological or paleontological resources. ▪ Policy 5.6.3-P5: In the event that archaeological/paleontological resources are discovered, require that work be suspended until the significance of the find and recommended actions are determined by a qualified archaeologist/paleontologist.

Plans and Policies	Summary
City of San Jose	
City of San José 2040 *General Plan* (2011)	The City of San José General Plan has two policies and one action in place to protect paleontological resources: ▪ Policy ER-10.1: Proposed development sites that have been identified as archaeologically or paleontologically sensitive, require investigation during the planning process in order to determine whether potentially significant archaeological or paleontological information may be affected by the project and then require, if needed, that appropriate mitigation measures be incorporated into the project design. ▪ Policy ER-10.3: Ensure that City, State, and Federal historic preservation laws, regulations, and codes are enforced, including laws related to archaeological and paleontological resources, to ensure the adequate protection of historic and pre-historic resources. ▪ Action ER-10.4: The City will maintain a file of archaeological and paleontological survey reports by location to make such information retrievable for research purposes over time.
City of Morgan Hill	
City of Morgan Hill General Plan (2016)	The City of Morgan Hill's General Plan requires preservation of the City's historic identity and cultural resources for future generations. To support this, two policies are in place regarding paleontological resources. ▪ Policy HC-8.1: This policy requires the City to identify and protect heritage resources from loss and destruction. ▪ Policy HC-8.5: This policy requires that if cultural resources, including tribal, archaeological, or paleontological resources, are uncovered during grading or other on-site excavation activities, construction shall stop until appropriate mitigation is implemented.
County of San Benito	
County of San Benito General Plan (2015)	The San Benito County General Plan contains one goal, two policies, and one implementation program relating to the stewardship and protection of paleontological resources in the County. ▪ Goal NCR-1 is to preserve and enhance valuable open space lands that provide wildlife habitat and conserve natural, historical, archaeological, paleontological, tribal, and visual resources of San Benito County ▪ Policy NCR-7.10 requires that the County educate the public regarding laws, codes, and ordinances that forbid collecting items associated with tribal, archeological, historical, and paleontological sites, and unique geological formations, particularly artifacts or other objects found in association with human remains. ▪ Policy NCR-7.11 states that the County shall prohibit unauthorized grading, collection, or degradation of Native American, tribal, archaeological, or paleontological resources, or unique geological formations. ▪ Implementation Program NCR-G is to prepare and distribute, as necessary, information related to inventories of historic resources in the county, including educational materials regarding the laws, codes, and ordinances that forbid collecting of items associated with archeological, historical, and paleontological sites, particularly artifacts or other objects found in association with human remains.

Plans and Policies	Summary
County of Merced	
2030 Merced County General Plan (2013), Recreation and Cultural Resources (RCR) Element	The Merced County General Plan states that archaeological, historical, architectural, paleontological, and Native American cultural resources and values must be considered in all phases of planning and subsequent development projects, including design, permitting, construction, and long-term maintenance. It is essential that the public and project proponents be aware of cultural resources, as well as all county, state, and federal environmental laws and regulations that protect them. ▪ Policy RCR-2.9 states that the County must establish and adopt mandatory guidelines for use during the environmental review processes for private and public projects to identify and protect historical, cultural, archaeological, and paleontological resources, and unique geological features. ▪ Program RCR-B requires the County to prepare and formally adopt guidelines and standards for the preparation of assessments of historical, cultural, archaeological, and paleontological resources, and unique geological features prepared pursuant to Policy RCR-2.9. At a minimum, the guidelines will include resource survey guidelines covering personnel qualifications, research and field techniques, investigation and documentation, data collection and recordation, and resource preservation, avoidance, minimization, and mitigation strategies.
City of Los Banos	
City of Los Banos General Plan (2009)	The City of Los Banos General Plan contains references to protecting paleontological resources but does not lay out any specific protections. ▪ Guiding Policy POSR-G-12 requires the City to identify and preserve the archaeological and historic resources that are found within the Los Banos Planning Area. ▪ Implementing Action POSR-I-37 requires that new development analyze and avoid any potential impacts on archaeological, paleontological, and designated historic resources by studying the potential effects of development and construction (as required by CEQA). No further guidance is provided on the protection or mitigation of paleontological resources within the City.

Hazardous Materials and Wastes

Table 10 Regional and Local Plans and Policies Relevant to Hazardous Materials and Wastes

Plans and Policies	Summary
Santa Clara County	
Santa Clara County Ordinance Code, Division B11 (2016)	The Santa Clara County Department of Environmental Health Hazardous Materials Compliance Division regulates the storage and handling of hazardous materials through hazardous materials building permits and storage permits. The Ordinance Code includes a Hazardous Materials Storage Ordinance, which defines hazardous materials and requires hazardous materials business plans. The goal is to protect health, life, resources and property through prevention and control of unauthorized discharges and hazardous materials.

Plans and Policies	Summary
Santa Clara County General Plan (1994)	The Hazardous Materials subsection of the Santa Clara County General Plan includes a multipronged strategy for reducing risk from hazardous wastes. Two overarching strategies are listed: ▪ Strategy 1: Manage hazardous materials safely and effectively. ▪ Strategy 2: Ensure the adequacy of local hazardous waste treatment facilities.
City of San Jose	
City of San Jose General Plan (2011)	The General Plan of the City of San Jose stipulates where new hazardous waste facilities may be located and how hazardous materials will be regulated. ▪ Policy ES-1.4 encourages new schools to avoid locations near hazardous materials storage areas. ▪ Policy ES-3.16 calls for a comprehensive program to control and mitigate harmful effects from the storage, use, and transport of hazardous materials.
City of San Jose Municipal Code (2018)	The City of San Jose regulates hazardous materials storage, requiring monitoring plans and permits. ▪ Section 17.68.010: The purpose is the protection of health, life, resources, and property through prevention and control of unauthorized discharges of hazardous materials. ▪ Section 17.68.300: Each facility must have a hazardous materials management plan in place and, if it handles hazardous materials above certain usage thresholds, must submit an annual inventory. ▪ Section 17.68.600: Any entity that stores hazardous materials must keep a current storage permit.
City of Morgan Hill	
City of Morgan Hill Municipal Code, Chapter 8.40 (2018)	Morgan Hill regulates new and existing hazardous materials storage facilities by requiring permits and hazardous materials management plans. The Municipal Code establishes containment standards for hazardous materials facilities.
City of Morgan Hill General Plan 2035 (2016)	The City of Morgan Hill General Plan establishes policies to reduce the risks from hazardous materials by monitoring their use and treatment before disposal, and requiring hazardous materials handling plans. ▪ Policy SSI-4-3: Use and handling requirements, including inspections and monitoring to ensure compliance with hazardous materials regulations. ▪ Policy SSI-4-5: Storage and usage, including regular inspections. ▪ Policy SSI-4-6: Short-term storage, including regular inspections, for facilities that store materials for less than 90 days. ▪ Policy SSI-4-7: Handling, including requiring the submittal of a hazardous materials handling plan. ▪ Policy SSI-4-11: Transportation monitoring, including notification of County jurisdictions in the case of a leak or spill. ▪ Policy SS-4-12: Annual records of hazardous materials inventories submitted to the County. ▪ Policy SS-4-16: Contaminated site mitigation required for projects in areas contaminated from previous discharges. ▪ Action SSI-4-B: Transportation routes for hazardous materials to be specified by the City.

Plans and Policies	Summary
City of Gilroy	
Gilroy City Code (2016)	The City of Gilroy has adopted the California Fire Code with amendments. The Gilroy amendments customize the fire code to agree with Santa Clara County regulations for the definition of and management of hazardous wastes.
Gilroy Hazardous Materials Ordinance (1998)	The Building, Life and Environmental Safety Division of the City of Gilroy administers the Hazardous Materials Ordinance, which mandates hazardous materials business plans, inspections, and permits. ▪ Obligation II.03.A. Mandates possession of a Hazardous Materials Storage Permit. ▪ Obligation II.03.B. Mandates proper containment of hazardous materials. ▪ Obligation II.03.C. Storage shall be in conformance with a Hazardous Materials Business Plan. ▪ Obligation II.03.D. Requires a permit for storage of hazardous materials in an underground storage tank.
Gilroy General Plan 2020 (2002)	Policies 27.01 through 27.05 address hazardous materials education, permitting and monitoring, and transport within the City of Gilroy to minimize danger to public health.
San Benito County	
San Benito County 2035 General Plan (2015)	The County of San Benito General Plan identifies the following plans goals and policies relevant to hazardous materials and wastes: ▪ Goal HS-6: To safeguard and protect the health and safety of people, the environment, and personal property from the potential dangers associated with a hazardous materials release. ▪ HS-6.1: Requires proper storage and disposal of hazardous wastes. ▪ HS-6.2: Requires the County to implement a Hazardous Waste Management Plan. ▪ HS-6.5: The County shall restrict transport of hazardous materials to designated routes.
San Benito County Code of Ordinances (2018)	The San Benito County Code of Ordinances mandates a Hazardous Waste Management Plan.
Merced County	
Merced County Year 2030 General Plan (2013)	The Merced County General Plan outlines policies for hazardous materials waste, transport, and storage, and land development on potentially contaminated parcels. ▪ Goal HS-5: Protect Merced County residents, visitors, and property through the safe use, storage, transport, and disposal of hazardous materials and wastes. ▪ Policy HS-5.1: Requires safe use, storage, transport, and disposal of hazardous materials. ▪ Policy HS-5.2: Coordinate with California Highway Patrol for hazardous materials transport. ▪ Policy HS-5.4: Requires new developments to protect soils, surface water, and groundwater from hazardous materials contamination.

Plans and Policies	Summary
City of Los Banos	
City of Los Banos 2030 General Plan Update (2009)	The City of Los Banos General Plan outlines the City's policy toward hazardous waste, including the adoption of the Merced County Hazardous Waste Management Plan. In addition, the general plan lists hazardous sites within city limits. ▪ Guiding Policy S-G-4: Protect Los Banos' ecology and residents from harm resulting from the improper production, use, storage, disposal, or transportation of hazardous materials. ▪ Action S-I-20: Discourage placement of hazardous materials-producing industries within 0.25 mile of hospitals, schools, and residential neighborhoods. ▪ Action S-I-21: Require Phase I and Phase II studies for new developments on land potentially contaminated with hazardous materials. ▪ Action S-I-22: Require remediation of contaminated sites.
City of Los Banos Municipal Code (2016)	The City of Los Banos has adopted the California Fire Code with city-specific amendments.

Safety and Security

Table 11 Regional and Local Plans and Policies Relevant to Safety and Security

Plan/Policy Document	Summary
Regional	
Taming Natural Disasters (2010)	The *Association of Bay Area Governments Executive Board will adopt the Taming Natural Disasters* pending FEMA approval. The 2010 update of the 2005 plan includes the following goals applicable to safety and security: ▪ Infrastructure 2-(a-4): Retrofit or replace critical lifeline infrastructure facilities and/or their backup facilities that are shown to be vulnerable to damage in natural disasters. ▪ Transportation 3-(a-15): Ensure that transit operators, private ambulance companies, cities, and/or counties have mechanisms in place for medical transport during and after disasters that take into consideration the potential for reduced capabilities of roads following these same disasters. ▪ Hazards and Public Education 5-(g-5): Facilitate and/or coordinate the distribution of emergency preparedness or mitigation materials that are prepared by others, such as by making the use of the internet or other electronic means, or placing materials on community access channels or in city or utility newsletters, as appropriate. ▪ Hospitals and Other Critical Health Care Facilities 3-(a-3): Ensure health care facilities are adequately prepared to care for victims with respiratory problems related to smoke and/or particulate matter inhalation. ▪ Critical Facilities Owned by Government 1-(Strategy GOVT a-1): Assess the vulnerability of critical facilities (such as city halls, fire stations, operations and communications headquarters, community service centers, seaports, and airports) to damage in natural disasters and make recommendations for appropriate mitigation. ▪ Coordination Among Local Governments 2-(d-2): Recognize that emergency services is more than the coordination of police and fire response; it also includes

Plan/Policy Document	Summary
	planning activities with providers of water, food, energy, transportation, financial, information, and public health services.
Santa Clara County	
Santa Clara County General Plan (2016)	Santa Clara County adopted the *Santa Clara County General Plan* on December 20, 1994 (amendments published November 2, 2016) The general plan includes the following goals and policies applicable to safety and security: Transportation (TR) ▪ Policy C-TR 42: Development and application of advanced transportation-related technologies should be supported to meet current and future travel demand, minimize economic productivity losses due to roadway congestion, and increase travel safety. Hazards and Safety (HS) ▪ Policy C-HS 17: Local governments should comply with all federal and state regulations regarding emergency planning and preparedness. ▪ Policy C-HS 36: General strategies for airport safety in Santa Clara County include the following: o Limit population densities and land uses within designated safety zones. o Regulate structures and objects, which could be hazardous or distracting to air navigation. ▪ Policy C-HS 37: Land use plans and development proposals within the "influence boundaries" of affected jurisdictions should be consistent with ALUC land use plans for airport safety.
Santa Clara County Operational Area Emergency Operations Plan (2008)	Santa Clara County adopted the *Santa Clara County Operational Area Emergency Operations Plan* on March 25, 2008. The Plan establishes a county emergency management organization, which will coordinate and support on-scene responses including maintenance of situational awareness, facilitation of effective communication between emergency centers at various levels of government, and interaction with public information sources. The plan also establishes the overall operational concepts associated with the management of emergencies at the County and Operational Area levels and provides a flexible platform for planning and response to all hazards and emergencies believed to be important to Santa Clara County. It is applicable to a wide variety of anticipated emergencies including earthquake, wildland/urban interface fires, floods, terrorism, and public health emergencies. The plan includes the following goals related to emergency management and response and applicable to safety and security: ▪ Provide effective life safety measures and reduce property loss and damage to the environment. ▪ Provide for the rapid resumption of impacted businesses, community, and government services. ▪ Provide accurate documentation usable for cost recovery efforts, and after-action improvements in our procedures.
County Of Santa Clara Emergency Operations Plan (2017)	The County of Santa Clara Emergency Operations Plan (EOP) is an all-hazards document describing Santa Clara County's incident management organization, compliance with relevant legal statutes, other relevant guidelines, whole community engagement, continuity of government focus, and critical components of the incident management structure. The plan includes the following goals related to emergency management and response and applicable to safety and security: ▪ Maximize the safety of the public, minimize property and environmental damage, and ensure the continuity of government.

Plan/Policy Document	Summary
	▪ Contribute to the National Preparedness Goal of the Federal Emergency Management Agency (FEMA). ▪ Maintain a robust incident management organization with strong collaborative ties among governments, community-based organizations, volunteers, public service agencies, and the private sector.
Annex to 2010 Association of Bay Area Local Hazard Mitigation Plan Taming Natural Disasters (2011)	Santa Clara County adopted the Association of Bay Area Government's *Annex to 2010 Association of Bay Area Local Hazard Mitigation Plan Taming Natural Disasters* in December of 2011. The plan is intended to serve many purposes and includes the following goals and policies related to safety and security, including: ▪ Helping residents of the County better understand the hazards that threaten public health, safety, and welfare; economic vitality; and the operational capability of important institutions. ▪ Insuring Santa Clara County and its incorporated cities can take full advantage of state and federal grant programs, policies, and regulations that encourage or mandate that local governments develop comprehensive hazard mitigation plans. ▪ Providing the policy basis for mitigation actions that should be promulgated by participating jurisdictions to create a more disaster-resistant future. ▪ To qualify for certain forms of federal aid for pre- and post-disaster funding, local jurisdictions must comply with the federal Disaster Mitigation Act (DMA) 2000 and it's implementing regulations (44 CFR Section 201.6). DMA 2000 intends for hazard mitigation plans to remain relevant and current.
Comprehensive Land Use Plan Santa Clara County: South County Airport (San Martin Airport) (2016)	The Santa Clara County Airport Land Use Commission adopted the *Comprehensive Land Use Plan Santa Clara County: South County Airport* on November 19, 2008. The plan was amended in 2016. The plan includes the following goals and policies applicable to safety and security: ▪ Safety Policy S-6: The principal means of reducing risks to people on the ground is to restrict land uses so as to limit the number of people who might gather in areas most susceptible to aircraft accidents. ▪ Reconstruction Policy R-1: Reconstruction projects that are not subject to a previous avigation easement shall not be required to provide an avigation easement as a condition for approval.
Comprehensive Land Use Plan Santa Clara County: Moffett Federal Airfield (2016)	The Santa Clara County Airport Land Use Commission adopted the *Comprehensive Land Use Plan Santa Clara County: Moffett Federal Airfield* on November 2, 2012. The plan was amended in 2016. The plan includes the following goals and policies applicable to safety and security: ▪ Safety Policy S-6: The principal means of reducing risks to people on the ground is to restrict land uses so as to limit the number of people who might gather in areas most susceptible to aircraft accidents. ▪ Reconstruction Policy R-1: Reconstruction projects that are not subject to a previous avigation easement shall not be required to provide an avigation easement as a condition for approval.
Santa Clara County: Norman Y. Mineta San Jose International Airport Comprehensive Land Use Plan (2016)	The Santa Clara County Airport Land Use Commission adopted the *Santa Clara County Norman Y. Mineta San Jose International Airport Comprehensive Land Use Plan* on May 25, 2011. The plan was amended in 2016. The plan includes the following goals and policies applicable to safety and security: ▪ Safety Policy S-6: The principal means of reducing risks to people on the ground is to restrict land uses so as to limit the number of people who might gather in areas most susceptible to aircraft accidents.

Plan/Policy Document	Summary
	▪ Reconstruction Policy R-1: Reconstruction projects that are not subject to a previous avigation easement shall not be required to provide an avigation easement as a condition for approval.
City of Santa Clara	
City of Santa Clara 2010-2035 General Plan (2010)	The City of Santa Clara adopted the *City of Santa Clara 2010-2035 General Plan* on November 16, 2010. The general plan includes the following goals and policies applicable to safety and security: ▪ Goal 5.8.1-G2: Transportation networks that provide a safe, efficient, convenient and integrated system to move people and goods. ▪ Policy 5.8.3-P7: Provide transit stops at safe, efficient and convenient locations to maximize ridership, including near employment centers, higher-density residential developments and Downtown. ▪ Goal 5.8.7-G2: Neighborhoods protected from negative effects associated with rail and freight services. ▪ Goal 5.10.5-G1: Protection of life, the environment and property from natural catastrophes and man-made hazards. ▪ Goal 5.10.5-G2: Adequate emergency preparedness plans. ▪ Goal 5.10.5-G3: Availability of emergency services in the event of a disaster. ▪ Policy 5.10.5-P4: Identify appropriate evacuation routes so people can be efficiently evacuated in the event of a natural disaster.
City of San Jose	
Envision San Jose 2040 General Plan (2011)	The City of San Jose adopted the *Envision San Jose 2040 General Plan* on November 1, 2011. The general plan includes the following goals and policies which are applicable to safety and security: ▪ Goal EC-3: Minimize the risk of injury, loss of life, property damage, and community disruption from seismic shaking, fault rupture, ground failure (liquefaction and lateral spreading), earthquake-induced landslides, and other earthquake-induced ground deformation. ▪ Policy EC-3.5: Locate, design and construct vital public utilities, communication infrastructure and transportation facilities in a manner that maximizes risk reduction and functionality during and after an earthquake. ▪ Policy EC-4.3: Locate new public improvements and utilities outside of areas with identified soils and/or geologic hazards (e.g., deep seated landslides in the Special Geologic Hazard Study Area and former landfills) to avoid extraordinary maintenance and operating expenses. Where the location of public improvements and utilities in such areas cannot be avoided, effective mitigation measures will be implemented. ▪ Goal EC-5: Protect the community from flooding and inundation and preserve the natural attributes of local floodplains and floodways. ▪ Goal EC-8: Protect lives and property from risks associated with fire-related emergencies at the urban/wildland interface. ▪ Policy ES-3.1: Provide rapid and timely level of service response time to all emergencies: 1. For police protection, use as a goal a response time of six minutes or less for 60 percent of all Priority 1 calls, and of 11 minutes or less for 60 percent of all Priority 2 calls.

Plan/Policy Document	Summary
	2. For fire protection, use as a goal a total response time (reflex) of eight minutes and a total travel time of four minutes for 80 percent of emergency incidents. ▪ Policy ES-3.24: Analyze service demands and deploy dynamic response techniques to reduce response time and maximize use of available resources. ▪ Policy TR-14.3 For development in the Airport Influence Area overlays, ensure that land uses and development are consistent with the height, safety and noise policies identified in the Santa Clara County Airport Land Use Commission (ALUC) comprehensive land use plans for Mineta San José International and ReidHillview airports, or find, by a two-thirds vote of the governing body, that the proposed action is consistent with the purposes of Article 3.5 of Chapter 4 of the State Aeronautics Act, Public Utilities Code Section 21670 et seq. ▪ Policy TR-14.4 Require avigation and "no build" easement dedications, setting forth maximum elevation limits as well as for acceptance of noise or other aircraft related effects, as needed, as a condition of approval of development in the vicinity of airports.
City of Morgan Hill	
Morgan Hill 2035 General Plan (2016)	The City of Morgan Hill adopted the *Morgan Hill 2035 General Plan* on July 27, 2016. The general plan includes the following goals and policies applicable to safety and security: Transportation (TR) ▪ Goal TR-1: A balanced, safe, and efficient circulation system for all segments of the community, meeting local needs and accommodating projected regional and sub-regional traffic while protecting neighborhoods. ▪ Policy TR-1.3: Implement strategies to ensure safe and appropriate operation of all components of the transportation system for all users, such as programs to lower crash rates and reduce the number of transportation-related injuries in the city through education, enforcement, engineering strategies, physical improvements, and operational systems. Prioritize strategies that improve safety for students, pedestrians, and bicyclists. ▪ Goal TR-6: A safe and efficient transit system that reduces congestion by providing viable non-automotive modes of transportation. ▪ Goal TR-7: Well-planned High-Speed Rail service that minimizes negative local impacts. Safety, Service, and Infrastructure (SSI) ▪ Goal SSI-2: Reduction of potential harm to persons or property from geologic/seismic hazards. ▪ Goal SSI-3: Minimize threat to persons, property, and the environment from fire hazards. ▪ Policy SSI-3-2: Avoid actions which increase fire risk, such as increasing public access roads in fire hazard areas, because of the great environmental damage and economic loss associated with a large wildfire. ▪ Policy SSI-3.5: Work cooperatively with CAL FIRE and other public agencies with responsibility for fire protection to reduce fire risks in Morgan Hill. ▪ Goal SSI-4: Avoidance of exposure to hazardous substances. ▪ Goal SSI-5: The least possible damage to persons and property from flooding. ▪ Goal SSI-6: Adequate, safe, and environmentally responsible drainage and flood control

Plan/Policy Document	Summary
	▪ Goal SSI-7: To protect the public's health and safety, ensure compatible land uses with South County Airport operations. ▪ Goal SSI-11: Efficient police, fire, and emergency medical response and services, and access to local medical facilities. ▪ Goal SSI-12: Reduce risk to life and property associated with emergencies and natural and manmade disasters.
City of Morgan Hill Office of Emergency Service Emergency Operations Plan Revision 2.0 (2018)	The City of Morgan Hill adopted the Revised *City of Morgan Hill Office of Emergency Service Emergency Operations Plan* on January 18, 2018. The plan defines the actions required before, during, and after an emergency and to guide the City's response to major emergencies/disasters. ▪ Mitigation: Actions taken to reduce exposure to, probability of, or potential loss from hazardous events ▪ Preparedness: Establishing of authorities and responsibilities for emergency actions and the garnering of resources to support them. ▪ Response: Time-sensitive actions taken to save lives and protect property, including actions to stabilize the situation. Response actions include notifying and activating the City's emergency management organization. ▪ Recovery: Efforts to restore the infrastructure, social, and economic life of the City.
City of Gilroy	
Gilroy General Plan (2002)	The City of Gilroy adopted the *City of Gilroy General Plan* and *City of Gilroy General Plan Environmental Impact Report* on June 13, 2002. The general plan includes the following goals and policies applicable to safety and security: ▪ Goal 18: Public health and safety through (1) the provision of high quality police, fire, and emergency response services that respond to community needs and issues; (2) education programs that raise community awareness about public safety issues; and (3) preventive programs that involve residents in deterring crime, reducing fire hazards, and addressing other threats to public health and safety. ▪ Policy 18.01: Continue to provide and maintain police and fire services that are adequate in manpower, equipment, and resources to respond to localized emergencies and calls for service within the City. The departments' current levels of service should be maintained or improved as the City continues to grow, with average emergency response times for police services of approximately 4.5 minutes and average emergency response times for fire services of less than 5.0 minutes. ▪ Policy 18.03: Ensure that facilities designated as local command control centers for emergency/disaster services are designed to withstand a "maximum probable seismic event" and remain operational. Secondary facilities should be identified and equipped as back up. ▪ Policy 18.05: Continue to provide essential emergency public services during natural catastrophes. Promote emergency preparedness through staff training and planning in cooperation with other public agencies and appropriate public interest organizations. ▪ Policy 18.07: Ensure adequate access for emergency vehicles and equipment, providing a second means of ingress and egress in all development. ▪ Goal 25: (a) Minimal potential for loss of life, injury, damage to property, economic and social dislocation, and unusual public expense due to natural hazards. (b) Development and use controls to protect the public from the risk of flood damage and to minimize hazards posed by fire, seismic activity, geologic

Plan/Policy Document	Summary
	instability, soil erosion, weak and expansive soils, and potentially hazardous soils materials.
San Benito County	
San Benito County 2035 General Plan (2015)	San Benito County adopted the *San Benito County 2035 General Plan* on July 21, 2015. The general plan includes the following goals and policies applicable to safety and security: Circulation (C) ▪ Goal C-3: To promote a safe and efficient public transit system that provides a viable travel alternative to automobiles, maximizes mobility, and reduces roadway congestion and greenhouse gas emissions. ▪ Goal C-6: To promote the safe and efficient use of aviation facilities. Public Facilities and Services (PFS) ▪ Policy PFS-1.5: The County shall site public facilities to minimize the potential vulnerability of the facilities to natural and human-made hazards and threats. ▪ Goal PFS-12: To provide adequate law enforcement facilities and services to prevent crime, ensure the safety of residents and visitors, and protect private and public property. ▪ Policy PFS-12.2: The County shall strive to achieve and maintain appropriate Sheriff Department response times for all call priority levels to provide adequate law enforcement services for all County residents. ▪ Goal PFS-13: To coordinate with fire protection and emergency service providers to ensure adequate fire facilities, equipment, and services are available to protect county residents and property from fire. ▪ Policy PFS-13.1: The County shall strive to maintain fire department staffing levels and response times consistent with National Fire Protection Association standards. ▪ Policy PFS-13.2: The County shall maintain mutual aid agreements between fire districts and emergency service providers to ensure residents and property are adequately served and to facilitate the efficient use of available resources. Health and Safety (HS) ▪ Goal HS-1: To maintain the necessary level of fire, EMS, law enforcement, and disaster preparedness for the protection of the health, safety, and welfare of people living, working, and residing in San Benito County. ▪ Policy HS-1.1: Provide adequate fire and EMS protection based on current state and national standards to promote a safe and vibrant community with limited fire loss and loss of life. ▪ Policy HS-1.2: Work with the Cities and fire protection agencies in the region to provide County residents with adequate fire and life safety protection to promote the general welfare and economy of the community and its citizens. ▪ Policy HS-1.4: The County shall maintain local law enforcement, fire, and health services in a state of readiness to insure adequate protection during a disaster for the citizens of San Benito County. ▪ Policy HS-1.7: The County shall develop, maintain, and implement a Multi-Hazard Mitigation Plan to address disasters such as earthquakes, flooding, dam or levee failure, hazardous material spills, epidemics, fires, extreme weather, major transportation accidents, and terrorism. ▪ Policy HS-1.9: The County shall continue to maintain the Emergency Operations Center (EOC) as the single point for centralized management and coordination of emergency response and recovery operations during a disaster or emergency.

Plan/Policy Document	Summary
	▪ Goal HS-2: To minimize the loss of life, injury, or damage to property as a result of floods in the county. ▪ Goal HS-3: To protect lives and property from seismic and geologic hazards. ▪ Goal HS-4: To minimize the risk of wildland and urban fire hazards. ▪ Goal HS-6: To safeguard and protect the health and safety of people, the environment, and personal property from the potential dangers associated with a hazardous materials release. ▪ Goal HS-7: To promote the safe operation of public and private airports and protect the safety of county residents.
San Benito County Operational Area Emergency Operations Plan (2015)	San Benito County adopted the *San Benito County Operational Area Emergency Operations Plan* on August 25, 2015. The plan provides the needed foundation for the management of emergencies and disasters and addresses the integration and coordination with other governmental levels when required. Operational Goals include the following: ▪ Mitigate hazards ▪ Meet basic human needs ▪ Address needs of people with disabilities and older adults ▪ Restore essential services ▪ Support community and economic recovery
Frazier Lake Airpark Comprehensive Land Use Plan (2001)	The San Benito County Airport Land Use Commission adopted the *Frazier Lake Airpark Comprehensive Land Use Plan* on November 15, 2001. The plan includes the following policies applicable to safety and security: ▪ Height Compatibility Policy: Any project that may exceed a FAR Part 77 surface must notify the Federal Aviation Administration (FAA) as required by FAR Part 77, Subpart B on FAA Form 7460-1, Notice of Proposed Construction or Alteration. (Notification to the FAA under FAR Part 77, Subpart B, is required even for certain proposed construction that does not exceed the height limits allowed by Subpart C of the FARs). ▪ Safety Compatibility Criteria: The principal means of reducing risks to people on the ground is to restrict land uses so as to limit the number of people who might gather in areas most susceptible to aircraft accidents.
Hollister Municipal Airport Land Use Compatibility Plan (2012)	The San Benito County Airport Land Use Commission adopted the *Hollister Municipal Airport Land Use Compatibility Plan* on June 21, 2012. The plan includes the following policies applicable to safety and security: ▪ Safety Policy Objective 3.3.1: The intent of land use safety compatibility criteria is to minimize the risks associated with an off-airport aircraft accident or emergency landing. The policies focus on reducing the potential consequences of such events when they occur. Risks both to people and property in the vicinity of an airport and to people on board the aircraft shall be considered. ▪ Airspace Protection Policy 3.4.7: The project proponent must submit notification of a proposal to the FAA where required by the provisions of FAR Part 77, Subpart B, and by the California Public Utilities Code, Sections 21658 and 21659. FAA notification requirements apply to all objects including structures, antennas, trees, mobile objects, and temporary objects such as construction cranes. The FAA will conduct an "aeronautical study" of the object(s) and determine whether the object(s) CHAPTER 2 POLICIES 2–30 Hollister Municipal Airport Land Use Compatibility Plan would be of a height that would constitute a hazard to air navigation. See Appendix C for a copy of FAR Part 77

Plan/Policy Document	Summary
	and online procedures for filing Form 7460-1. The following requirements reflect ALUC policy: (a) Local agencies shall inform project proponents of the requirements for notification to the FAA. FAA notification is required under the following circumstances: (1) The project contains proposed structures or other objects that exceed the height standards defined in FAR Part 77, Subpart B, as applied to the Hollister Municipal Airport (see Policies 3.4.4(a)(1) and 3.4.4(a)(3)), unless the object is shielded by nearby taller objects as is exempted in accordance with FAR Part 77, Paragraph 77.15. Note that notification to the FAA under FAR Part 77, Subpart B, is required even for certain proposed construction that does not exceed the height limits allowed by Subpart C of the regulations. (2) Any proposal for construction or alteration of a structure, including antennas, taller than 200 feet above the ground level at the site regardless of proximity to any airport. (b) Any proposed development project that includes construction of a structure or other object and that is required to be submitted to the ALUC for a consistency review in accordance with Policies 1.5.3 or 1.5.5 shall include a copy of the completed FAR Part 77 notification form (Form 7460-1) submitted to the FAA, if applicable, and of the resulting FAA findings from its aeronautical study (i.e., notice of determination letter). (c) ALUC Review: The requirement for notification to the FAA shall not by itself trigger an airport compatibility review of an individual project by the ALUC. If the general plan of the local agency in which the project is to be located has been determined by the ALUC to be consistent with this Compatibility Plan, then no ALUC review is required. If the general plan has not been made consistent, then the proposed project must be submitted to the ALUC for review (see Policies 1.5.3 and 1.5.5).
Merced County	
2030 Merced County General Plan (2013)	Merced County adopted the *2030 Merced County General Plan* on December 10, 2013. The general plan includes the following goals and policies applicable to safety and security: ▪ Policy CIR-4.1: Encourage a complete, safe, and interconnected bicycle and pedestrian circulation system that serves both commuter and recreational travel, and provides access to major destinations within and between urban communities and cities. ▪ Goal CIR-5: Maintain and expand a rail transportation system that provides safe, efficient, and reliable movement of freight and passengers within and through Merced County. ▪ Policy CIR-5.4: Encourage alternatives to at-grade rail crossings at existing and future roads. ▪ Policy CIR-5.7: Coordinate with the California High Speed Rail Authority, the cities, and other local agencies in efforts to properly locate the High Speed Rail corridors throughout Merced County, including at least one station and a heavy maintenance facility

Plan/Policy Document	Summary
	▪ Goal CIR-6: Ensure that air transportation systems provide safe, efficient, and reliable movement of passengers and freight. ▪ Goal HS-1: Minimize the loss of life, injury, and property damage of County residents due to seismic and geologic hazards. ▪ Goal HS-2: Minimize the possibility of loss of life, injury, or damage to property as a result of flood hazards. ▪ Goal HS-3: Minimize the exposure of county residents and public and private property to the effects of urban and wildland fires. ▪ Goal HS-4: Promote the safe operation of airports and the safety of Merced County residents by requiring that any new development within the airport area of influence be consistent with the requirements of the Merced County Airport Land Use Commission's compatibility plan and compliant with Federal Aviation Administration regulations. ▪ Policy PFS-5.5: Require utility and pipeline companies and districts maintain contingency plans for responding to potentially hazardous situations such as pipeline breaks and fallen power lines. ▪ Goal PFS-6: Ensure the provision of timely and adequate law enforcement through proper management and staffing of the Sheriff Department in Merced County. ▪ Goal PFS-7: Provide adequate fire and emergency medical facilities and services to protect County residents from injury and loss of life, and to protect property from fire. ▪ Policy PFS-7.6: Strive to achieve and maintain optimum staffing levels and appropriate response times to provide adequate emergency medical services for all county residents.
County of Merced Emergency Operations Plan (2013)	Merced County adopted the *County of Merced Emergency Operations Plan* in December, 2013. The plan includes the following goals applicable to safety and security: ▪ Mitigate hazards ▪ Meet basic human needs ▪ Address needs of people with disabilities and older adults ▪ Restore essential services ▪ Support community and economic recovery
County of Merced Department of Public Health Medical / Health Emergency Operations Plan (2017)	The Medical / Health Emergency Operations Plan, adopted December 2017, provides Departmental Operations Center (DOC) responders with procedures and position checklists, and provides detailed information in supplemental requirements such as Public Information, Hazard Mitigation, and Recovery Operations for disaster response. The goal of the Plan is to promote community health, prevent disease, injury, and disability, and minimize the morbidity and mortality that occur as a result of a disaster.
Merced County Airport Land Use Compatibility Plan (2012)	Merced County adopted the *Merced County Airport Land Use Compatibility Plan* on June 21, 2012. The plan includes Los Banos Municipal Airport, and includes the following policy is applicable to safety and security: ▪ Safety Criteria Policy Objective 5.2.1: The intent of land use safety compatibility criteria is to minimize the risks associated with an off-airport aircraft accident or emergency landing. The policies focus on reducing the potential consequences of such events when they occur. Risks both to people and property in the vicinity of an airport and to people on board the aircraft shall be considered. (Note that land

Plan/Policy Document	Summary
	use features that can be the *cause* of an aircraft accident are addressed under Airspace Protection, Section 5.2.11.) ▪ Airspace Protection Criteria Policy 5.3.4: The criteria for determining the acceptability of a project with respect to height shall be based upon the standards set forth in Federal Aviation Regulations (FAR) Part 77, Subpart C, Objects Affecting Navigable Airspace, and applicable airport design standards published by the FAA. Additionally, where an FAA aeronautical study of a proposed object has been required as described in Policy 5.3.6, the results of that study shall be taken into account by the ALUC and the local agency.
City of Los Banos	
City of Los Banos 2030 General Plan Update (2009)	The City of Los Banos adopted the *Los Banos General Plan Update* in 2009. The General Plan includes the following. Safety (S) ▪ Policy S-G-3 Protect Los Banos' residents and businesses from potential wildfire and structural fire hazards. ▪ Policy S-G-5 Maintain and enhance the City's capacity for law enforcement and fire-fighting. ▪ Policy S-G-8 Minimize the risk of personal injury, property damage, and environmental damage from both natural and manmade disasters.

Socioeconomics and Communities

Table 12 Regional and Local Plans and Policies Related to Socioeconomics and Communities

Policy Document	Goal, Policy, or Objective
Regional	
Plan Bay Area (2013)	*Plan Bay Area* was adopted by the Association of Bay Area Governments in 2013. The following goals and policies from the plan are relevant to the project extent. ▪ Target #2: House 100 percent of the region's projected population growth by income level (very-low, low, moderate, above-moderate) without displacing current low-income residents. ▪ Target #7: Decrease by 10 percentage points (to 56 percent, from 66 percent) the share of low-income and lower-middle income residents' household income consumed by transportation and housing.
Metropolitan Transportation Commission (2015)	The Metropolitan Transportation Commission adopted the following relevant policy statement in February 2015. "Below 200 percent of poverty" includes all those described as 'in poverty' under the official U.S. Census Bureau definition, plus some people who have incomes above poverty but less than two times their poverty threshold." Due to high income levels in this region, the percent of population below 200 percent of poverty is used for the San Jose to Gilroy subsections.

Policy Document	Goal, Policy, or Objective
Santa Clara County	
Santa Clara County General Plan (1994, 2014)	The *Santa Clara County General Plan* was adopted in 1994 and updated in 2014. The following goals and policies from the plan are relevant to the project extent: Growth and Development (C-GD) ▪ C-GD 37 Within the urban areas of Santa Clara County, a balance should be achieved and maintained between employment levels, housing supply, infrastructure capacity, and environmental quality. ▪ C-GD 40 Improved balance between employment and housing opportunities should include the need for: a. increased overall supply and more varied types of housing; b. housing costs commensurate with household income distribution; and c. increased proximity of housing to employment centers. Economic Well-Being (C-EC) ▪ C-EC 3 Diversification in the mix of local industry should be encouraged in Santa Clara County to achieve a broader base of industrial and commercial activities in order to insulate the local economy from possible future economic downturns and to provide more lower skilled jobs. ▪ C-EC 5 Barriers such as inadequate housing, transportation and childcare facilities which prevent individuals from obtaining employment should be reduced or eliminated. ▪ C-EC 7 The potential impacts on businesses of all sizes should be considered in developing local government plans, policies, regulations, approval processes, and fees. ▪ C-EC 8 Local governments, as part of an overall economic development program, should work to maintain and improve the overall quality of life in Santa Clara County by: a. increasing the supply of affordable housing; b. improving our transportation network and facilitating alternative transportation modes; ▪ C-EC 11 Local governments should adequately plan for infrastructure improvements needed to accommodate planned growth. Housing (HG) ▪ HG 1 The planning for the supply and diversity of housing in each part of the urbanized areas county shall provide for existing and expected employment and household needs and a diversity of affordability that matches the diversity of household incomes, while respecting the capacity of constructed or planned public systems and services. ▪ HG 4 The County and the cities should work cooperatively to ensure that there is a balanced housing supply sufficient to achieve countywide economic, social, and environmental objectives. Further opportunities for interagency, intergovernmental, interregional, and public/private cooperation should be sought out and encouraged. ▪ HG 5 Intergovernmental and public and private cooperation shall be encouraged to achieve an adequate supply of affordable housing that meets changing demographic needs in Santa Clara County. ▪ HG 10 The County of Santa Clara shall work to enforce laws against discrimination against people of protected status under federal and state law. ▪ HG 13 The provision of affordable housing which is suitable for a variety of special needs households shall be given high priority in housing assistance programs. ▪ HG 21 The conservation and rehabilitation of the existing housing supply shall be encouraged and facilitated.

Policy Document	Goal, Policy, or Objective
City of Santa Clara	
City of Santa Clara 2010–2035 General Plan (2010, 2014)	On November 16, 2010, the City Council adopted the *2010–2035 General Plan*. The following goals and policies from the plan are relevant to the project extent: General Land Use ▪ 5.3.1-P1 Preserve the unique character and identity of neighborhoods through community-initiated neighborhood planning and design elements incorporated in new development. ▪ 5.3.1-P5 Implement a range of development densities and intensities within General Plan land use classification requirements to provide diversity, use land efficiently and meet population and employment growth. Residential Land Use ▪ 5.3.2-G1 Equitable housing opportunities within the community for persons of all economic levels, regardless of religion, gender, sexual orientation, marital status, national origin, ancestry, familial status, race, color, age, source of income or mental or physical disability. ▪ 5.3.2-G2 A variety of housing types, sizes, location and tenure in order to maintain social and economic diversity in the City. ▪ 5.3.2-G3 Affordable housing units dispersed throughout the City to avoid a concentration in any one neighborhood. ▪ 5.3.2-G4 Respect for the existing character and quality of adjacent neighborhoods from new residential development and redevelopment. ▪ 5.3.2-G5 Compliance with all State and federal regulations related to housing opportunities and the prevention of discrimination. Commercial Land Use ▪ 5.3.3-G1 A variety of retail, commercial and neighborhood office uses throughout the City, consistent with the intensities defined in the commercial land use classifications. ▪ 5.3.5-P1 Work with existing Santa Clara businesses to retain and expand employment opportunities and strengthen the existing tax base. ▪ 5.3.5-P2 Encourage existing businesses that may be displaced by new development to relocate within Santa Clara. Housing Element ▪ Policy A-1: Maintain and improve the quality of residential neighborhoods, eliminate housing deficiencies and prevent future blight through the encouragement of ongoing maintenance, rehabilitation and conservation of existing housing stock. ▪ Goal C: Provide housing within the community for persons of all economic levels, regardless of religion, gender, sexual orientation, marital status, national origin, ancestry, familial status, source of income, or mental or physical disability. ▪ Goal D: Provide an adequate variety of individual choices of housing tenure, type and location, including higher density where possible, especially for low and moderate income and special needs households
City of San Jose	
Envision: San Jose 2040 General Plan (2011) *and 2014–23 Housing Element* (2015)	The City of San Jose adopted *Envision: San Jose 2040 General Plan* in 2011. The following goals and policies from the plan are relevant to the project extent: Land Use and Employment ▪ IE-1.5 Promote the intensification of employment activities on sites in close proximity to transit facilities and other existing infrastructure.

Policy Document	Goal, Policy, or Objective
	▪ IE-1.6 Plan land uses, infrastructure development, and other initiatives to maximize utilization of the Mineta San Jose International Airport, existing and planned transit systems including fixed rail (e.g., High-Speed Rail, BART and Caltrain), Light-Rail and Bus Rapid Transit facilities, and the roadway network. Consistent with other General Plan policies, promote development potential proximate to these transit system investments compatible with their full utilization. Encourage public transit providers to serve employment areas. ▪ IE-1.9 Invest in strategic infrastructure improvements, as appropriate, in order to encourage private investment, reduce new construction costs, increase business efficiency, and in order to support business retention and growth, stimulate economic activity, and employ people. ▪ IE-1.13 Achieve goals related to Quality Neighborhoods, including diverse housing options, a walkable/bikable public street and trail network and compact, mixed-use development where infrastructure exists to distinguish San Jose as a livable and attractive city, to promote interaction among community members, and to attract talented workers to the City. Broad Economic Prosperity ▪ IE-6.2 Attract and retain a diverse mix of businesses and industries that can provide jobs for the residents of all skill and education levels to support a thriving community. ▪ IE-6.3 Attract job opportunities accessible to all of San Jose's residents, particularly residents in low-income neighborhoods. City Operations ▪ FS-4.1 Preserve and enhance employment land acreage and building floor area capacity for various employment activities because they provide revenue, near-term jobs, contribute to our City's long-term achievement of economic development and 2 job growth goals, and provide opportunities for the development of retail to serve individual neighborhoods, larger community areas, and the Bay Area. Housing (H) ▪ H-1.1 Through the development of new housing and the rehabilitation of existing housing, facilitate the creation of economically, culturally, and demographically diverse and integrated communities. ▪ H-1.2 Facilitate the provision of housing sites and structures across location, type, price and status as rental or ownership that respond to the needs of all economic and demographic segments of the community including seniors, families, the homeless and individuals with special needs. ▪ H-1.3 Create housing opportunities and accessible living environments that allow seniors to age in place, either in the same home, assisted living facilities, continuing care facilities, or other housing types within the same community. ▪ H-1.4 Encourage the location of housing designed for senior citizens in neighborhoods where health and community facilities and services are within a reasonable walking distance and are accessible by public transportation. ▪ H-1.5 Facilitate the development of multi-generational housing in compact form that meets the needs of families living together. ▪ H-1.7 Comply with State and Federal laws prohibiting discrimination in housing and that support fair and equal access to housing. ▪ H-2.1 Facilitate the production of extremely low-, very low-, low-, and moderate-income housing by maximizing use of appropriate policies and financial resources at the federal, state, and local levels; and various other programs.

Policy Document	Goal, Policy, or Objective
	▪ H-2.2 Integrate affordable housing in identified growth locations and where other housing opportunities may exist, consistent with the Envision General Plan. ▪ H-2.3 Conserve viable housing stock through a balanced combination of housing code enforcement and complementary programs such as rehabilitation loans and grants to help maintain the supply of low-priced housing. ▪ H-2.4 Allow affordable residential development at densities beyond the maximum density allowed under an existing Land Use/Transportation Diagram designation, consistent with the minimum requirements of the State Density Bonus Law (Government Code Section 65915) and local ordinances. ▪ H-2.5 Facilitate second units on single-family residential lots, in conformance with our City's Secondary Unit Ordinance, to take advantage of a potential source of affordable housing and to assist our City in meeting its needs as identified in its Consolidated Plan. ▪ H-2.6 Evaluate and incorporate, if feasible, an affordable housing component in the preparation of specific plans, master plans, or strategy plans that include plans for housing. ▪ H-2.7 Support strategies in collaboration with other jurisdictions and agencies to end homelessness by creating permanent housing solutions combined with services such as medical, education, and job placement. ▪ H-2.8 Facilitate the production of affordable and safe housing for workers who provide goods and services to San Jose residents and businesses. ▪ H-2.11 Update the City's dispersion policy: 1) to align the location of future affordable housing developments with planned future Growth Areas identified in the Envision General Plan; 2) to be consistent with the City's inclusionary housing ordinance; 3) to maximize the access of transit, retail, services, and amenities to affordable housing developments; and 4) to reemphasize the support for integration and complete communities. ▪ H-2.13 Maintain our City's Inclusionary Housing Policy and Ordinance, and provide technical assistance to the development community to ensure that residential projects conform to it. ▪ H-2.14 Support State and federal regulations that preserve "at-risk" subsidized rental units subject to potential conversion to market rate rents and that will encourage equitable and fair policies that protect tenant and owner rights. ▪ H-3.4 Promote the conservation and rehabilitation of existing viable housing stock. ▪ H-3.5 Prioritize housing resources to assist those groups most in need, or to those geographic locations in the City that most require investment in order to improve neighborhood blight conditions. ▪ H-3.6 Regulate conversions of rental apartments to condominium or community apartment projects to meet public health and safety standards and to assist displaced renters. Residential rentals undergoing conversion should meet or exceed the minimum residential density in this Plan. General Land Use (LU) ▪ LU-1.1 Foster development patterns that will achieve a complete community in San Jose, particularly with respect to increasing jobs and economic development and increasing the City's jobs-to-employed resident ratio while recognizing the importance of housing and a resident workforce. ▪ LU-1.6 Locate employee-intensive commercial and industrial uses within walking distance of transit stops. Encourage public transit providers to provide or increase services to areas with high concentrations of residents, workers, or visitors.

Policy Document	Goal, Policy, or Objective
	▪ LU-2.1 Provide significant job and housing growth capacity within strategically identified "Growth Areas" in order to maximize use of existing or planned infrastructure (including fixed transit facilities), minimize the environmental impacts of new development, provide for more efficient delivery of City services, and foster the development of more vibrant, walkable urban settings. ▪ LU-2.2 Include within the Envision General Plan Land Use / Transportation Diagram significant job and housing growth capacity within the following identified Growth Areas: o Downtown – The City's Downtown Strategy plans for ambitious job and housing growth capacity in the Downtown area to reinforce its role as San Jose's civic, cultural and symbolic center and to support key infrastructure investments, including the planned BART and High-Speed Rail systems. o Urban Villages: BART/Caltrain Station Areas – To maximize utilization of the Caltrain and BART systems, support regional commuting and foster the City's growth as a regional job center, significant new job growth capacity is planned for the each of the BART / Caltrain Urban Villages. Significant job and housing growth capacity is planned for the Berryessa BART station area in order to support intensification of the station area as a regional employment destination and to achieve a level of density consistent with that planned for other BART and Light Rail station areas. o Urban Villages: Transit / Commercial Corridors – A large and balanced amount of job and housing growth capacity is planned for the Transit / Commercial Corridor Urban Villages with the goal to maximize the opportunity for creating new mixed-use Urban Villages in these areas. While the BART area job capacity is planned primarily for mid-rise and high-rise offices, the Light Rail Urban Villages provide more opportunity for retail and service jobs that benefit from close proximity to residential use. Although the BART system serves as a regional transit line that brings workers from throughout the region to employment centers within San Jose, the light rail system is more appropriate for shorter commute trips and is also less likely to generate land use compatibility concerns. Accordingly, it is appropriate to include more residential and retail growth capacity along the light rail system. The Oakridge Mall Light Rail station area is particularly of interest because of its size and high level of unrealized potential to support a walkable, mixed-use community owing to the amount and diversity of established commercial uses and other services already located within the area. ▪ LU-9.3 Integrate housing development with our City's transportation system, including transit, roads, and bicycle and pedestrian facilities. ▪ LU-9.10 Discourage substantial expansion of existing nonresidential uses (e.g., major structural improvements or expansions) that are incompatible with residential uses on properties designated for residential use. ▪ LU-9.13 Equitably distribute residential social service programs (e.g., board and care facilities) throughout the City, especially in areas with access to transit, rather than concentrating them in a few areas. Encourage the County and other social service licensing agencies to recognize and implement this policy. ▪ LU-9.14 Allow small residential care and service facilities, supportive housing, and transitional housing for up to six persons, in residential neighborhoods of any density. Encourage facilities for more than six persons to locate in areas with access to transit, retail, services, and other amenities. ▪ LU-10.3 Develop residentially- and mixed-use-designated lands adjacent to major transit facilities at high densities to reduce motor vehicle travel by encouraging the use of public transit.

Policy Document	Goal, Policy, or Objective
	▪ LU-10.5 Facilitate the development of housing close to jobs to provide residents with the opportunity to live and work in the same community. ▪ LU-11.5 Integrate new and existing neighborhoods and facilitate movement throughout the City by connecting streets and particularly by providing pedestrian and bicycle cross-access connections. Integrate new infill development into the existing neighborhood pattern, continuing, and where applicable extending or completing, the existing street network. Transportation (TR) ▪ TR-1.1 Accommodate and encourage use of non-automobile transportation modes to achieve San Jose's mobility goals and reduce vehicle trip generation and vehicle miles traveled (VMT). ▪ TR-1.3 Increase substantially the proportion of commute travel using modes other than the single-occupant vehicle. ▪ TR-3.3 As part of the development review process, require that new development along existing and planned transit facilities consist of land use and development types and intensities that contribute toward transit ridership. In addition, require that new development is designed to accommodate and to provide direct access to transit facilities. ▪ TR-3.4 Maintain and improve access to transit stops and stations for mobility-challenged population groups such as youth, the disabled, and seniors. ▪ TR-4.1 Support the development of amenities and land use and development types and intensities that increase daily ridership on the VTA, BART, Caltrain, ACE and Amtrak California systems and provide positive fiscal, economic, and environmental benefits to the community. ▪ TR-4.3 Support the development of amenities and land use and development types and intensities that contribute to increased ridership on the potential high-speed rail system, and also provide positive benefits to the community. ▪ TR-4.4 Work cooperatively with the California High-Speed Rail Authority to ensure that rail corridors within the city are planned and constructed in a manner that enhances the character of the surrounding neighborhoods.
Midtown Specific Plan (1992)	The *Midtown Specific Plan* was adopted by the City of San Jose in 1992. The following goals and policies from the plan are relevant to the project extent: ▪ Policy 1.1 A wide diversity of multi-family and alternative housing types, as well as a mixture of rental and ownership housing, should be encouraged. ▪ Policy 1.4 Existing industrial uses should be encouraged to remain and intensify between Park Avenue and West San Carlos Street. ▪ Policy 1.11 Appropriate setbacks and treatments should be established between future residential development and the mainline railroad tracks along the eastern edge of the Cahill West neighborhood. ▪ Objective 5 Preserve and intensify existing industrial and commercial-service uses along the Lincoln and Auzerais Avenue corridors. ▪ Policy 3.3 Any new industrial/commercial development should provide adequate mitigation for nearby existing or planned residential uses. ▪ Policy 3.4 To retain the important economic contribution of the properties designated Combined Industrial/Commercial (e.g., the Del Monte plant on Auzerais Avenue), new uses in close proximity to the Combined Industrial/Commercial areas should provide an adequate buffer for noise, vibration, and other potential conflicts.

Policy Document	Goal, Policy, or Objective
Diridon Station Area Plan (2014)	The *Diridon Station Area Plan* was adopted by the City of San Jose in 2014. The following goals and policies from the plan are relevant to the project extent: ▪ Establish a land use plan and policy framework that will guide future development and redevelopment toward land uses that support transit ridership and economic development and create a world-class cultural destination. ▪ Improve pedestrian, bicycle, motorized and transit connectivity between the station site and existing adjacent commercial and residential areas. ▪ Develop and implement urban design standards that promote walkable, livable, and business supportive environments within the Diridon Station Area. ▪ Provide a variety of commercial and mixed-use development opportunities, ranging from large-scale corporate or institutional sites to smaller infill development sites. ▪ Create a highly active and lively pedestrian and bicycle friendly environment with excellent connectivity to downtown destinations and regional transit. ▪ Enhance the existing neighborhoods and add high-density residential-commercial mixed-use development within the study area and to act as a catalyst for similar developments in surrounding areas.
Tamien Station Area Specific Plan (1995)	The *Tamien Station Area Specific Plan* was adopted by the City of San Jose in 1994. The following goals and policies from the plan are relevant to the project extent: Transit and Pedestrian Goals and Objectives ▪ Create a combination of land uses that effectively support transit use, reduce dependency on the automobile, and attract pedestrian activity. Livable Community Goals and Objectives ▪ Protect people and property in the Tamien Station area from potential environmental hazards such as noise, flooding, and the impacts associated with increased traffic. Neighborhood Compatibility Goals and Objectives ▪ Maintain the positive qualities and characteristics of existing neighborhoods by ensuring that new development is compatible with existing neighborhoods. ▪ Create a positive environment for the new neighborhoods developed in the Tamien Station area by preserving and enhancing the character of existing neighborhoods.
Communications Hill Specific Plan (1992)	The *Communications Hill Specific Plan* was adopted by the City of San Jose in 1992. The following goals and policies from the plan are relevant to the project extent: ▪ Adopt site planning and architectural guidelines and noise attenuation techniques to protect Communications Hill residents and workers from excessive noise from arterials, freeways, the fairground activities, adjacent industrial activities and trains and planes traveling nearby.
City of Morgan Hill	
Morgan Hill 2035 General Plan (2016) *and 2015–2023 Housing Element Update* (2015)	The *Morgan Hill 2035 General Plan* was adopted by the City of Morgan Hill in 2015. The *2015-2023 Housing Element Update* was adopted in 2015. The following goals and policies from the plan are relevant to the project extent: City and Neighborhood Form (CNF) ▪ Policy CNF-2.2 A Balanced Community. Plan for the needs of all socioeconomic segments of the community, encouraging a balance and match in jobs and housing within the City. ▪ Policy CNF-2.3 Quality of life. Maintain Morgan Hill's high quality of life for existing and future residents.

Policy Document	Goal, Policy, or Objective
	▪ Policy CNF-2.4 Changing Demographics. When considering future urban development, look at least five to ten years into the future to take into account changing local and regional demographics. ▪ Policy CNF-3.10 Multi-Family Housing. Maintain an adequate supply of allotments available for multi-family and affordable housing consistent with the City's adopted Housing Element. ▪ Policy CNF-8.19 Incompatible Uses. Use setbacks, natural and man-made barriers such as streams, park land, and drainage ways, and other mitigation to separate incompatible uses whenever possible. ▪ Policy CNF-10.5 Affordable Single-Family Housing. To the maximum extent possible, emphasize single-family units in affordable housing allocations, rental and ownership housing assistance projects, and rehabilitation programs to improve the existing housing stock. ▪ Policy CNF-11.1 Preservation of Single-Family Neighborhoods. Encourage preservation and rehabilitation of single-family neighborhoods within the City. ▪ Policy CNF-15.2 Successful Commercial Uses. Ensure the viability of Downtown and other recognized shopping areas, and discourage isolated and sprawling commercial activities along major roads. ▪ Policy CNF-15.6 Preservation of Homes Along Monterey Road. Encourage preservation of older homes along Monterey Road north of Central Avenue for commercial and office use. ▪ Policy CNF-17.1 Industrial Land Conversion. Discourage the conversion of property designated for industrial to non-industrial uses. ▪ Policy CNF-17.2 Industrial Land Use Conflicts. Ensure proposed new uses adjacent to industrial uses do not introduce land use conflicts that would adversely impact industrial activities. ▪ Policy CNF-17.4 Property between Monterey Road and UPRR Tracks. Allow a mix of uses on the property located on the east side of Monterey Road south of the Union Pacific train trestle. Require designs for new development to recognize the significance of this portion of Monterey Road as the northerly entrance to downtown and the necessary limitations on use due to its single point of access. Economic Development (ED) ▪ Policy ED-2.3 Economic Diversity. Promote a diversified economic industry base with a variety of job types and skills to insulate the local economy from possible economic downturns. Encourage agriculture as an appropriate part of the economic mix. (South County Joint Area Plan 2.02) ▪ Policy ED-3.1 Business Retention, Expansion, and Attraction Efforts. Encourage retention and expansion of existing businesses, and attract new businesses. ▪ Policy ED-3.2 Employment Land Supply. Preserve the City's supply of industrial and commercial lands to support the City's goals and policies related to economic development and jobs-housing balance. ▪ Policy ED-3.4 Business Attraction and Retention Strategy. Develop a biennial strategy that details the City's proactive approach to business attraction and retention that identifies the specific industries toward which efforts will be targeted, and focus the City's available economic development resources on assisting the targeted industries. ▪ Policy ED-3.5 Diverse Housing Stock. To help Morgan Hill businesses recruit and retain the necessary workforce, provide a diverse housing stock that meets the needs of employees at different income levels and with diverse household characteristics and housing preferences.

Policy Document	Goal, Policy, or Objective
	▪ Policy ED-7.5 Incentives to Revitalize and Reuse Shopping Centers. Consider and, if appropriate, offer a range of financial and non-financial incentives and assistance to encourage revitalization and reuse of obsolete shopping centers. ▪ Policy ED-7.8 Tenant Assistance. Proactively assist tenants who will be dislocated by revitalization or reuse projects to find replacement business locations within the City. ▪ Policy ED-9.3 Robust Transportation Options. Work with local and regional transportation agencies to ensure that local employees and residents have a robust set of transportation options to respond to changing workforce demographics and preferences, reduce roadway congestion, and improve local quality of life. Healthy Community (HC) ▪ Policy HC-3.1 Universal Recreation. Provide recreational facilities and programs that meet the needs of all Morgan Hill residents, including seniors, youth, low-income residents, and citizens with disabilities. Transportation (TR) ▪ Policy TR-2.1 Multi-Modal System for All Users. A balanced multi-modal system offers viable choices for residents, employees, customers, visitors, and recreational users. Use smart growth and Sustainable Communities principles throughout the city to provide a balanced transportation system which assures access to all, and which integrates all appropriate modes of transportation into an effectively functioning system, including modes such as auto, ride sharing, public rail and bus transit, paratransit, bicycling, and walking. (South County Joint Area Plan 11.00 & 11.01). ▪ Policy TR-3.18 Grade-Separated Railroad Crossings. Plan for the construction of grade-separated crossings of the Union Pacific railroad to improve emergency vehicle response times and minimize conflicts between railroad trains and on-road vehicles. California Public Utilities Commission approval is required to modify an existing highway rail crossing or to construct a new crossing. Grade-separated crossings should be encouraged at Dunne Avenue (Depot Street to be re-routed through the existing Community and Cultural Center parking lot to create an intersection with Church Street either prior to or in conjunction with the grade separation project). ▪ Policy TR-6.8 Transit for Changing Needs. Expand public transit as needed to meet the changing needs of the area for local and regional access, including methods such as bus, dial-a-ride, paratransit, and rail, where appropriate, for all users. (South County Joint Area Plan 11.04). ▪ Policy TR-7.2 Neighborhood Impacts. When examining potential impacts of High Speed Rail alternatives and proposals, attention shall be given to all Morgan Hill neighborhoods and mitigation measures shall be proportionate to identified impacts. Natural Resources and Environment (NRE) ▪ Policy NRE-4.1 Agriculture Retention and Transition to Urban Uses. Support programs and techniques, including conservation easements and purchase of development rights to encourage the retention of agricultural activities and to minimize conflicts in the transition from agriculture to urban uses. ▪ Policy NRE-4.2 Support for Agricultural Activity. Support agricultural activity by encouraging agriculture-related industry, commercial uses, and community events within the urban area, and expanding opportunities for small-scale agriculture. ▪ Policy NRE-4.7 Long-Term Maintenance of Agriculture. Continue to support the long-term maintenance of agricultural land uses and agriculture, including vineyards and wineries, as an economic enterprise in South County. (South County Joint Area Plan 14.00).

Policy Document	Goal, Policy, or Objective
	▪ Policy NRE-4.9 Urban Encroachment. Require new urban development adjacent to an existing agricultural operation to create an appropriate buffer area, on land within the proposed development, between urban uses and agricultural activities. ▪ Policy NRE-4.10 Land Use to Support Agricultural Viability. Maintain the economic viability of agriculture using a variety of methods. ▪ Policy NRE-4.13 Urban Growth. Wherever existing development patterns and existing and planned roads and other public facilities permit, concentrate urban development adjacent to existing developed areas in order to minimize the impact of development on agricultural land. Plan for further urban growth to occur in areas which will avoid encroachment into those agricultural lands with the greatest long-term potential to remain economically viable. (South County Joint Area Plan 14.07). ▪ Policy NRE-11.2 TACs and Existing Sensitive Uses. Encourage the installation of appropriate air filtration mechanisms at existing schools, residences, and other sensitive receptors adversely affected by existing or proposed pollution sources. ▪ Policy NRE-12.1 Best Practices. Requirement that development projects implement best management practices to reduce air pollutant emissions associated with construction and operation of the project. ▪ Policy NRE-12.3 Control Measures. Require construction and demolition projects that have the potential to disturb asbestos (from soil or building material) to comply with all the requirements of the California Air Resource Board's air toxics control measures (ATCMs) for Construction, Grading, Quarrying, and Surface Mining Operations. Safety, Services and Infrastructure (SSI) ▪ Policy SSI-8.1 Exterior Noise Level Standards. Require new development projects to be designed and constructed to meet acceptable exterior noise level standards.
Downtown Morgan Hill Specific Plan (2009)	The *Downtown Morgan Hill Specific Plan* was adopted by the City of Morgan Hill in 2009. The following goals and policies from the plan are relevant to the project extent: ▪ Promote Transit-Oriented Development along Third and Depot Streets, as well as on Block 16, to strengthen the relationship between the train station and residential uses. While Block 16 is designated for Mixed Use-CBD, desired development is for high-density residential use, Caltrain/VTA parking, with perhaps some office uses. Any commercial service use should be minor or ancillary, and retail uses are prohibited under this Specific Plan, as the goal is that retail uses be concentrated in the Downtown Core. ▪ Encourage the preservation of the small-scale residential neighborhoods west of Monterey Road and north of Fourth Street.
San Martin Planning Area	
Santa Clara County General Plan (1994, 2014)	The *Santa Clara County General Plan* was adopted in 1994 and updated in 2014. The following goals and policies from the plan are relevant to the project extent: Land Use (R-LU) ▪ R-LU 114 San Martin is a rural unincorporated community governed by the County Board of Supervisors. Furthermore, San Martin should be viewed as a distinct geographic entity, unique within the rural unincorporated areas of Santa Clara County and having a unique rural identity and character within the South County area. Care should be taken to prevent premature commitment of land for uses which would restrict future options for the community. In order to best preserve future options for the San Martin community and environs, San Martin shall remain a rural community, predominantly nonurban and residential in nature. ▪ R-LU 114.1 Policies, permit decision-making, and other matters subject to the discretion of the County and Board of Supervisors shall also take into consideration

Policy Document	Goal, Policy, or Objective
	the desire and intent of the community to preserve and enhance the character, identity, and importance of the village core area of San Martin, being that area most central to the distinct identity of San Martin. ▪ R-LU 136 Residential land use and development patterns shall remain the preferred and predominant use pattern in the San Martin Planning Area. Establishment of allowed non-residential uses in areas of existing or planned rural residential land use should be allowed only with the utmost consideration for the potential adverse impact of such uses upon the residential character and quality of life of the community. ▪ R-LU 141 Agricultural uses should be encouraged to continue.
City of Gilroy	
Gilroy 2020 General Plan (2002) *and 2015–23 Housing Element* (2014)	The *Gilroy 2020 General Plan* was adopted by the City of Gilroy in 2002; the *2015–23 Housing Element* was adopted in 2014. The following goals and policies from the plan are relevant to the project extent: Community Design ▪ Policy 1.02 Mix of Uses. Create a diverse mix of land uses to achieve a balance between jobs and housing and to ensure the community's long-term viability. Through the Land Use Plan Map, the City shall encourage a range of housing types, a diversity of businesses and industries, and adequate services and leisure activities to meet residents' social and economic needs. ▪ Policy 1.05 Existing Neighborhoods. Maintain and enhance the quality of existing residential neighborhoods, ensuring adequate public facilities such as parks, schools, streets, water supply, and drainage. Protect residential neighborhoods from excessive noise and traffic impacts; provide pedestrian and bicycle circulation facilities to encourage walking and biking; and work with the Santa Clara Valley Transportation Authority (VTA) to provide adequate levels of transit service to meet resident needs. Encourage infill developments that enhance neighborhood quality, supporting community input and participation in the planning and design of large infill projects or projects that propose non-residential, neighborhood-serving uses (such as neighborhood commercial uses). Infill development in existing residential neighborhoods should follow similar design guidelines as those outlined for new neighborhoods in the Neighborhood Districts text on pages 3-8 through 3-14. Economic Development ▪ Policy 3.01 Jobs and Revenues. Attract industrial, high-tech, and commercial office employers to provide a diversity of well-paid job opportunities for local residents and to broaden the City's revenue base, ensuring adequate resources over time to support the provision of quality city services. Also, support the development, retention, and expansion of small and medium size businesses, agricultural businesses, and tourism-related businesses, recognizing their vital importance to the City's economic future. See also SCJAP 2.01 and 2.02. ▪ Policy 3.02 Economic Development Activities. Actively promote Gilroy as a place for business and industry, capitalizing on the City's location and numerous amenities, to encourage new businesses to locate here and to retain existing businesses. ▪ Policy 3.26 Business Development in the Downtown. Provide amenities that will make Downtown attractive to office users and retail businesses (e.g., convenient parking, an attractive and safe environment, access to regional transit services, high quality infrastructure, reliable services, etc.) and encourage new office and retail businesses and expansions of existing businesses in Gilroy to locate there. Agriculture

Policy Document	Goal, Policy, or Objective
	▪ Policy 4.01 Economic Viability of Agriculture. Support the long-term economic viability of agriculture and agri-tourism, thereby encouraging landowners to keep their land in cultivation. ▪ Policy 4.02 Agricultural Land Preservation. Work with the County, LAFCo, and other relevant agencies as well as private landowners to protect agricultural and grazing lands from encroachment by urban uses, and to encourage the use of such lands for active cultivation. Specifically, implement the strategies and actions recommended by the South County Agricultural Study (Strategies to Balance Planned Growth and Agricultural Viability in the Areas South and East of Gilroy, October 1996). Housing Element (H) ▪ Policy H-1.2 The City shall encourage the provision of a variety of housing options for Gilroy residents. ▪ Policy H-1.C. Variety of Housing in Neighborhood Districts The City shall review and revise, as appropriate, the Neighborhood District Policy to ensure that it encourages the development of housing that is affordable to a variety of income groups by comparing its features with the Residential Development Ordinance and making any changes to ensure the two policies are compatible and designed to reach the same goals. ▪ Policy H-2.1 The City shall encourage the provision of new affordable housing. ▪ Policy H-2.2 The City shall provide incentives for affordable housing, including but not limited to the density bonus ordinance, expedited project review, and Affordable Housing Exemption in the Residential Development Ordinance. ▪ Policy H-2.3 The City shall support homeownership opportunities for low- and moderate-income households. ▪ Policy H-2.4 The City shall encourage partnerships between non-profit and for-profit housing developers to encourage affordable housing production. ▪ Policy H-2.5 The City shall continue to require 15 percent of new housing in the Neighborhood District to be affordable to very low-, low-, and moderate-income households. ▪ Policy H-2.6 The City shall consider the development of single-room occupancy units, studio apartments, and other similar unit types that are affordable to extremely low-income residents in higher-density areas of the city. ▪ Policy H-2.7 The City shall continue to participate in programs that assist lower- and moderate-income households to secure affordable housing, such as the County's Mortgage Credit Certificate program, Section 8 rental voucher programs, and the Housing Trust Fund of Santa Clara County. ▪ Policy H-3.2 The City shall strive to preserve the affordability of existing below market rate housing units. ▪ Policy H-3.E. Rent and Income Restrictions on Rental Below-Market Rate Units The City shall continue to implement rent and income restrictions on rental Below Market Rate (BMR) units to ensure that affordable units provided through public assistance or public action are retained for 30 years or more as affordable housing stock. ▪ Policy H-4.1 The City shall encourage housing opportunities for special needs groups, including: seniors; persons with disabilities, including developmental disabilities; the homeless; large households; single female-headed households; and farmworkers. ▪ Policy H-4.2 The City shall encourage the development, rehabilitation, and preservation of affordable and market-rate housing for seniors, particularly in

Policy Document	Goal, Policy, or Objective
	neighborhoods that are accessible to public transit, commercial services, and health and community facilities. ▪ Policy H-4.3 The City shall support efforts to provide emergency shelter, transitional housing, and permanent supportive housing for homeless persons and those at risk of homelessness. ▪ Policy H-4.4 The City shall support the development of permanent and seasonal farmworker housing in appropriate areas of the city. ▪ Policy H-4.5 The City shall encourage affordable housing developments to include units that can accommodate large households of five or more. ▪ Policy H-4.6 The City shall encourage the development and maintenance of housing accessible to people with disabilities, including developmental disabilities. ▪ Policy H-4.7 The City shall continue to provide individuals with disabilities reasonable accommodation through flexibility in the application of land use or zoning, when necessary to eliminate barriers to housing opportunities. ▪ Policy H-5.1 The City shall promote fair housing standards.
Gilroy Economic Development Strategic Plan (2015)	The *Gilroy Economic Development Strategic Plan* was adopted by the City of Gilroy in 2015. The following goals and policies from the plan are relevant to the project extent: ▪ Transit Hub Station at 7th Street/Old Gilroy Street with Transit oriented Development in the area. ▪ No community divide – sense of one Gilroy community. ▪ Expand the city tax base through economic growth. ▪ Increase the numbers of businesses in Downtown. ▪ Expand public transportation services to Silicon Valley for events.
San Benito County	
San Benito County 2035 General Plan (2015)	The *San Benito County 2035 General Plan* was adopted by San Benito County in 2015. The following goals and policies from the plan are relevant to the project extent: Land Use (LU) ▪ GOAL LU-1 To maintain San Benito County's rural character and natural beauty while providing areas for needed future growth. ▪ LU-1.3 Future Development Timing: The County shall ensure that future development does not outpace the ability of either the County or other public/private service providers to provide adequate services and infrastructure. The County shall review future development proposals for their potential to reduce the level of services provided to existing communities or place economic hardships on existing communities, and the County may deny proposals that are projected to have these effects. (RDR/MPSP) ▪ GOAL LU-3: To ensure the long-term preservation of the agricultural industry, agricultural support services, and rangeland resources by protecting these areas from incompatible urban uses and allowing farmers to manage their land and operations in an efficient, economically viable manner. ▪ GOAL LU-6: To promote the development of new industrial and employment uses in the unincorporated parts of the county that are compatible with surrounding land uses and meet the present and future needs of county residents. Administration (AD) ▪ GOAL AD-2: To cooperate and coordinate with applicable local, regional, State, and Federal jurisdictions and agencies in order to achieve mutually beneficial development, environmental, and economic goals.

Policy Document	Goal, Policy, or Objective
Merced County	
2030 Merced County General Plan (2013)	The *2030 Merced County General Plan* was adopted by Merced County in 2013. The following goals and policies from the plan are relevant to the project extent: Economic Development (ED) ▪ Policy ED-1.8: Jobs/Housing Balance (RDR) Encourage all communities, and require new or expanded Community Plans, to include sufficient employment-based land uses to maintain a 1:1 jobs/housing balance. ▪ Policy ED-3.1: Business Retention (SO) Support local and regional business retention and expansion programs to ensure that County services are applicable and accessible to local businesses. ▪ Policy ED-3.2: Small Business Promotion (JP) Promote entrepreneurial development and small business expansion and recognize the job creation potential of locally-owned small businesses. ▪ Policy ED-5.2: Regional Cooperation (IGC) Cooperate with regional economic development organizations and agencies to expand and improve the economic base of the County. Land Use and Community Character (LU) ▪ Policy LU-1.7: Compact Development (RDR) Promote compact development in urban communities that supports pedestrian activity and transit ridership. ▪ Policy LU-5.A.6: Jobs/Housing Balance (RDR) Promote a jobs/housing balance by encouraging residential development near employment centers when preparing new or updating existing Community Plans and providing adequate land for employment generating land use. Agriculture (AG) ▪ Policy AG-2.2: Agricultural Land Mitigation (RDR) Protect productive agricultural areas from conversion to non-agricultural residential uses by establishing and implementing an agricultural mitigation program that matches acres converted with farmland acres of similar quality to those converted preserved at a 1:1 ratio. Coordinate with the six cities in Merced County and the Merced Local Agency Formation Commission (LAFCo), consistent with LAFCo's statutory mission to preserve agricultural land and open space, to establish consistent standards and mitigation for the loss of farmland. In addition, the Land Evaluation and Site Assessment Model (LESA model) may be used to determine whether the conservation land is of equal or greater value than the land being converted. ▪ Policy AG-2.8: Conservation Easements (RDR/MPSP) Support the efforts of public, private, and non-profit organizations to preserve agricultural areas in the County through dedicated conservation easements, and range land held as environmental mitigation. ▪ Policy AG-2.11: Preservation Collaboration (IGC/JP) Collaborate with landowners, cities, State and Federal agencies, colleges, universities, stakeholders, and community-based organizations to continue and expand agricultural preservation in the County. ▪ Policy AG-2.16: High Speed Rail Line Location (IGC) Coordinate with the California High Speed Rail Authority to locate the high speed rail lines along existing major transportation corridors, such as State Routes 99 or 152, to minimize the conversion of productive agricultural land to non-agricultural uses. Transportation and Circulation (CIR)

Policy Document	Goal, Policy, or Objective
	▪ Policy CIR-1.3: Transportation Efficiency (RDR) Encourage transportation programs that result in more efficient energy use, reduce greenhouse gas emissions and noise levels, and improve air quality. ▪ Policy CIR-3.1: Multi-Modal Transportation (RDR) Encourage multi-modal transportation opportunities within Urban Communities. ▪ Policy CIR-3.2: Transit Improvements (RDR) Continue to support transit efforts by the Merced County Association of Governments, Dial-A-Ride, UC Merced Transit, other public entities, private social service providers, and other various private charter services to improve and expand public transit throughout the County. ▪ Policy CIR-5.1: Freight and Passenger Rail Services (RDR) Support the continued operation and improvements to existing freight and passenger rail lines and terminals. ▪ Policy CIR-5.7: High Speed Rail (RDR/IGC) Coordinate with the California High Speed Rail Authority, the cities, and other local agencies in efforts to properly locate the High Speed Rail corridors throughout Merced County, including at least one station and a heavy maintenance facility. Housing Element ▪ Policy 1.1 The County shall continue to adopt programs, ordinances, incentives, land use plans and other regulatory mechanisms that provide opportunities for the private sector to address the housing needs of citizens in all economic levels. ▪ Policy 1.15 Wherever feasible, the County shall encourage affordable housing to be located in transit-oriented development projects. ▪ Policy 2.8 The County shall continue to provide rental assistance to very low- and low-income households through programs offered by the Housing Authority and other agencies. ▪ Policy 2.14 The County shall support the development of housing plans and programs, including new government subsidized housing, that maximize housing choice for minorities and lower-income households. ▪ Policy 4.1 The County shall strive to address the unique housing needs of seniors, large families, single-parent households, and the homeless, persons with disabilities, extremely low-income households, farmworkers, and students. Health and Safety (HS) ▪ Policy HS-7.4: New Noise or Groundborne Vibration Generating Uses (RDR) Require new commercial and industrial uses to minimize encroachment on incompatible noise or groundborne vibration sensitive land uses. Also consider the potential for encroachment by residential and other noise or groundborne vibration sensitive land uses on adjacent lands that could significantly impact the viability of the commercial or industrial areas. ▪ Policy HS-7.11: Train Whistle Noise (IGC) Support improvements to at-grade crossings in urban areas in order to eliminate the need for train whistle blasts near or within communities. Air Quality (AQ) ▪ Policy AQ-2.1: Air Quality Plan Compliance (RDR) Require all development projects to comply with applicable regional air quality plans and policies. ▪ Policy AQ-4.6: Non-Motorized Transportation (RDR) Encourage non-motorized transportation corridors within and between communities.
Merced County Regional Transportation Plan 2014–2040 (2014)	The Merced County Association of Governments' *Merced County Regional Transportation Plan and Sustainable Communities Strategy 2014–2040* was adopted

Policy Document	Goal, Policy, or Objective
	by Merced County in 2014. The following goals and policies from the plan are relevant to the project extent: ▪ Goal 1: A safe and efficient regional road system that accommodates the demand for movement of people and goods. ▪ Goal 2: Provide an efficient, effective, coordinated regional transit system that increases mobility for urban and rural populations, including transportation disadvantaged persons. ▪ Goal 3: A rail system that provides safe and reliable service for passengers. ▪ Policy 3.2: Establish a High-Speed Rail system connecting Merced and Los Banos to Sacramento and the Bay Area. ▪ Goal 7: Reduce usage of nonrenewable energy resources for transportation purposes. ▪ Goal 8: Achieve air quality standards set by the U.S. Environmental Protection Agency, and the State Air Resources Board. ▪ Goal 9: Provide economical, long-term solutions to transportation problems by encouraging community designs which encourage walking, transit, and bicycling.
City of Los Banos	
City of Los Banos 2030 General Plan Update (2009) *and 2014–2023 Housing Element* (2016)	The *City of Los Banos 2030 General Plan Update* was adopted by the City of Los Banos in 2009; the *2014–2023 Housing Element* was adopted in 2016. The following goals and policies from the plan are relevant to the project extent: Circulation (C-G) ▪ C-G-14 Participate in the planning process for the California High-Speed Train. Housing Element ▪ Objective 3 Encourage the maintenance, improvement and rehabilitation of the City's existing housing stock and encourage the maintenance and upkeep of existing affordable housing. ▪ Objective 5 Ensure that all residents have access to housing. ▪ Objective 7 Maintain an adequate percentage of affordable rental units within the City to accommodate all income groups and family types. ▪ Objective 8 Encourage redevelopment and new development projects for special need groups.

Station Planning, Land Use, and Development

Table 13 Regional and Local Plans and Policies Relevant to Station Planning, Land Use, and Development

Plan and Policies	Summary
Regional	
Plan Bay Area (2013)	The Association of Bay Area Governments and the Metropolitan Transportation Commission adopted *Plan Bay Area* as the Bay Area's long-term regional transportation and land use blueprint in 2013. The following goals and objectives are relevant to the project: ▪ Target #1: Reduce per-capita CO2 emissions from cars and light-duty trucks by 15 percent (Statutory requirement is for year 2035, per SB 375).

Plan and Policies	Summary
	▪ Target #6: Direct all nonagricultural development within the urban footprint (existing urban development and urban growth boundaries). ▪ Target #9: Increase non-auto mode share by 10 percentage points (to 26 percent of trips); decrease automobile vehicle miles traveled per capita by 10 percent.
San Joaquin Valley Blueprint Planning Process Summary Report (2010)	The *San Joaquin Valley Blueprint Planning Process Summary Report* was prepared in 2010. The following goals and policies are relevant to the project: ▪ Principle 7: Preserve open space, farmland, natural beauty, and critical environmental areas. ▪ Principle 8: Provide a variety of transportation choices. ▪ Principle 11: Enhance the economic vitality of the region. ▪ Principle 12: Support actions that encourage environmental resource management.
Santa Clara County	
Santa Clara County General Plan (1994)	The *Santa Clara County General Plan* was adopted in 1994. The following goals and policies are relevant to the project: ▪ Policy C-GD 14: Future urban development in Coyote Valley should be planned to realize the potential it holds for improving the City of San Jose's existing jobs-housing imbalance and for the benefit to the county as a whole, including: ▪ Policy C-GD 15: Land uses along public transit corridors in Coyote Valley should be of sufficient density and adequate design to encourage use of public transit and provide affordable housing. ▪ Policy C-GD 29: Land use and development patterns that enhance the cost effectiveness of transportation and other urban infrastructure investments should be encouraged. ▪ Policy C-GD 32: Mixed land use and compact development should be encouraged which clusters employment, residential, and the types of land uses, goods, and services customarily needed on a daily basis around transit stations, along transit corridors, and in other appropriate urban locations. ▪ Policy C-GD 33: Cities' land use plans should be coordinated and consistent with long range master plans for light rail and other transit services. ▪ Policy C-GD 35: Employment area densities should be increased wherever practical to support efficient public transit service. ▪ Policy C-TR 3: In order to safeguard future mobility and achieve other transportation-related goals and objectives stated in the Vision of the General Plan, the following set of coordinated strategies should guide decision-making and implementation efforts on a sub-regional basis: a. develop urban land use patterns that support travel alternatives; b. manage travel demand, system operation, and congestion levels; c. expand system capacity and improve system integration; and d. support new transportation technologies. ▪ Policy R-GD 1: Strategies and policies for managing land use and development in the rural unincorporated areas include the following: 1. Preserve the resources and rural character of lands outside Urban Service Areas. 2. Develop special area plans for areas that require or would benefit from more detailed planning and policies.

Plan and Policies	Summary
	▪ Policy R-LU 1: The term "Resource Conservation Areas" refers to a general category of land uses that consists of the following specific land use designations or classifications: a. Baylands; b. Agriculture; c. Hillsides; d. Ranchlands, Agricultural; e. Open Space Reserve; f. Regional Parks, Existing; and g. Other Public Open Space Lands. ▪ Policy R-LU 2: Rural unincorporated lands outside cities' Urban Service Areas that are not designated 'Rural Residential' or other specialized land uses shall be designated as a type of 'Resource Conservation Area.' These lands consist primarily of the mountains and foothills, Bay wetlands and lowlands, and valley agricultural lands. ▪ Policy R-LU 3: The general intent of each 'Resource Conservation Area' designation is to encourage land uses and densities appropriate to the rural unincorporated areas that also: a. help preserve rural character; b. conserve natural, scenic, and cultural resources; c. protect public health and safety from natural and man-made hazards; d. preserve agriculture and prime agricultural soils; e. protect watersheds and water quality; f. enhance air quality; and g. minimize the demand for and cost of public services and facilities. ▪ Policy R-LU-11: Allowable land uses shall be limited to: a. agriculture and ancillary uses; b. uses necessary to directly support local agriculture; and c. other uses compatible with agriculture which clearly enhance the long term viability of local agriculture and agricultural lands.
City of Santa Clara	
City of Santa Clara 2010-2035 General Plan (2010)	The *City of Santa Clara 2010-2035 General Plan* was adopted in November 2010. The following goals and policies are relevant to the project: ▪ 5.3.1-P5: Implement a range of development densities and intensities within General Plan land use classification requirements to provide diversity, use land efficiently and meet population and employment growth. ▪ 5.3.1-P13: Support high density and intensity development within a quarter-mile of transit hubs and stations and along transit corridors. ▪ 5.3.1-P15: Require new developments and major public infrastructure projects to include adequate rights- of-way to accommodate all modes of transportation. ▪ 5.3.2-P2: Encourage higher-density residential development in transit and mixed-use areas and in other locations throughout the City where appropriate. ▪ 5.3.4-G3: Mixed-use development that maximizes accessibility to alternate transportation modes and integrates pedestrian, bicycle, transit, open space and outdoor uses to encourage active centers.

Plan and Policies	Summary
City of San Jose	
Envision: San Jose 2040 General Plan (2011)	The *Envision: San Jose 2040 General Plan* was adopted in 2011. The following goals and policies are relevant to the project: ▪ Goal LU-1, General Land Use: Establish a land use pattern that fosters a more fiscally and environmentally sustainable, safe, and livable city. ▪ LU-1.6: Locate employee-intensive commercial and industrial uses within walking distance of transit stops. Encourage public transit providers to provide or increase services to areas with high concentrations of residents, workers, or visitors. ▪ Goal LU-2 – Growth Areas: Focus new growth into identified Growth Areas to protect the quality of existing neighborhoods, while establishing new mixed use neighborhoods with a compact and dense form that is attractive to the City's projected demographics i.e., a young and senior population, and that supports walking, provides opportunities to incorporate retail and other services in a mixed-use format, and facilitates transit use. ▪ Policy LU-2.1: Provide significant job and housing growth capacity within strategically identified "Growth Areas" in order to maximize use of existing or planned infrastructure (including fixed transit facilities), minimize the environmental impacts of new development, provide for more efficient delivery of City services, and foster the development of more vibrant, walkable urban settings. ▪ Policy LU-2.2: Include within the Envision General Plan Land Use / Transportation Diagram significant job and housing growth capacity within the following identified Growth Areas: o Downtown – The City's Downtown Strategy plans for ambitious job and housing growth capacity in the Downtown area to reinforce its role as San Jose's civic, cultural and symbolic center and to support key infrastructure investments, including the planned BART and High-Speed Rail systems. o Employment Lands – The Plan supports significant intensification of employment activity within each of the City's major employment districts (North San José, Monterey Corridor, Edenvale, Berryessa/International Business Park, Mabury, East Gish and Senter Road and North Coyote Valley). Within the North San José, Berryessa / International Business Park and Old Edenvale areas, a centralized sub-area with strong transit access has been designated as an Employment Center to support mid-rise or high-rise employment development. ▪ Policy LU-4.1: Retain existing commercial lands to provide jobs, goods, services, entertainment, and other amenities for San José's workers, residents, and visitors. ▪ Policy LU-10.3: Develop residentially- and mixed-use-designated lands adjacent to major transit facilities at high densities to reduce motor vehicle travel by encouraging the use of public transit. ▪ Policy LU-17.1: Allow development in hillside and rural residential areas consistent with or below existing or planned densities in these areas to maximize resource conservation. Support development only when it is compatible with the character and pattern of the surrounding area, even if below the maximum potential residential density as designated on the Land Use/Transportation Diagram. ▪ Policy TR-1.8. Actively coordinate with regional transportation, land use planning, and transit agencies to develop a transportation network with

Plan and Policies	Summary
	complementary land uses that encourage travel by bicycling, walking and transit, and ensure that regional greenhouse gas emission standards are met. ▪ Policy TR-4.1. Support the development of amenities and land use and development types and intensities that increase daily ridership on the VTA, BART, Caltrain, ACE and Amtrak California systems and provide positive fiscal, economic, and environmental benefits to the community. ▪ Policy TR-4.2. Work collaboratively with the California High-Speed Rail Authority to bring high speed rail to San José in a timely manner. ▪ Policy TR-4.3. Support the development of amenities and land use and development types and intensities that contribute to increased ridership on the potential high-speed rail system, and also provide positive benefits to the community. ▪ Policy TR-4.4. Work cooperatively with the California High-Speed Rail Authority to ensure that rail corridors within the city are planned and constructed in a manner that enhances the character of the surrounding neighborhoods.
Midtown Specific Plan (1992)	The City of San Jose's *Midtown Specific Plan* was adopted in 1992. The following goals and policies are relevant to the project: ▪ Configure land uses in Midtown (i.e., type, mix, density) in a manner that reinforces and maximizes transit ridership. ▪ Create a pattern of land uses, open space and transportation facilities that strengthens pedestrian access within Midtown and provides linkages to downtown and surrounding neighborhoods. ▪ Preserve viable industrial and commercial-service uses within Midtown. ▪ Introduce land uses that complement the existing character of adjacent single-family neighborhoods; ensure that new development immediately adjacent to these neighborhoods has a similar height, scale and orientation as the historic fabric of single-family homes. ▪ Ensure the efficient operation of existing and planned transit improvements within Midtown to reduce auto-dependency. ▪ Create a pattern of roadways that serves future land uses within the district and avoids vehicular impacts (particularly north-south through-movement) within the adjacent neighborhoods. Design roadways in a manner that reflects objectives for reduced auto-dependency and a strong pedestrian orientation. ▪ Aggressively pursue public funding of major infrastructure elements that will be of benefit to the larger community (e.g., Los Gatos Creek, transit, arterial roadways, etc.). <u>Cahill West Subarea</u> ▪ Objective 1: Create a high-density mixed-use neighborhood that complements and extends the pattern of residential uses in the adjacent St. Leo's neighborhood, and that reinforces existing commercial uses along The Alameda, Park Avenue, and West San Carlos Street. ▪ Policy 1.4: Existing industrial uses should be encouraged to remain and intensity between Park Avenue and West San Carlos Street. ▪ Policy 1.7: A pattern of development that reinforces and extends the block structure and pedestrian character of adjacent areas of San Jose should be established within Midtown. <u>Cahill East Subarea</u>

Plan and Policies	Summary
	▪ Objective 3: Intensity development surrounding Cahill Station in a manner to promote the area as a mixed-use transit district, with appropriate height and intensity transitions to Los Gatos Creek. ▪ Policy 3.2: To the extent feasible, single-purpose transportation and parking facilities should be concentrated west of Cahill Street, adjacent to the railroad right-of-way. <u>Vasona Subarea</u> ▪ Objective 4: Create a high-density mixed-use activity center surrounding the future West San Carlos Station of the Vasona LRT corridor. ▪ Policy 4.3: The major focus of this area should be the planned LRT station and an active pedestrian plaza connecting it with West San Carlos Street.
Diridon Station Area Plan (2014)	The *Diridon Station Area Plan* was adopted in 2014. The following goals and policies are relevant to the project: ▪ *Urban Form and Structure*. Create an urban district in the Station Area with buildings that maximize height potential. The Station Area should accommodate a mix of uses including commercial, office, and entertainment development. ▪ *Connectivity*. Establish and strengthen connections to surrounding districts and within the planning area for pedestrians, bicyclists, and motorists, with emphasis on east-west connectivity across SR 87 and the rail corridor. ▪ *Transportation*. Prioritize pedestrian circulation and transit. Improve pedestrian and bicycle connection to Guadalupe River from the area. ▪ *Compatibility with surrounding neighborhoods*. Ensure sensitive transitions in scale and design to surrounding residential neighborhoods. ▪ *Land Use*. Provide a range of commercial and residential uses. Commercial uses would include neighborhood services for surrounding residential areas, and a synergistic mix of entertainment, hotels, shopping, restaurants, and offices.
Tamien Station Area Specific Plan (1995)	The *Tamien Station Area Specific Plan* was adopted on March 21, 1995. The following goals and policies are relevant to the project: Transit and Pedestrian Goals and Objectives: 1. Create a combination of land uses that effectively support transit use, reduce dependency on the automobile, and attract pedestrian activity. 2. Locate the most intense uses and highest residential densities on sites in close proximity to transit facilities. 6. Replace existing land uses near transit facilities with more intensive land uses as market forces dictate or opportunities arise. Neighborhood Compatibility Goal and Objective: 1. Maintain the positive qualities and characteristics of existing neighborhoods by ensuring that new development is compatible with existing neighborhoods.
Communications Hill Specific Plan (1992)	The *Communications Hill Specific Plan* was adopted in1992. The following goals and policies are relevant to the project: ▪ Adopt site planning and architectural guidelines and noise attenuation techniques to protect Communications Hill residents and workers from excessive noise from arterials, freeways, the fairground activities, adjacent industrial activities and trains and planes traveling nearby.
City of Morgan Hill	
Morgan Hill 2035 General Plan (2016)	The *Morgan Hill 2035 General Plan* was adopted in 2016. The following goals and policies are relevant to the project:

Plan and Policies	Summary
	▪ Policy CNF-1.3 Regional Coordination. Work with other governmental agencies to reach a coordinated approach to future community development tasks (also see Regional Coordination Element). ▪ Policy CNF-8.19 Incompatible Uses. Use setbacks, natural and man-made barriers such as streams, park land, and drainage ways, and other mitigation to separate incompatible uses whenever possible. ▪ Policy CNF-17.2 Industrial Land Use Conflicts. Ensure proposed new uses adjacent to industrial uses do not introduce land use conflicts that would adversely impact industrial activities. ▪ Policy CNF-17.3. Buffer between Industrial and Incompatible Uses. Ensure that all industrial uses are well sited and buffered from incompatible uses; buffers may include offices adjacent to sensitive uses, landscaping, berms, etc. ▪ Policy CNF-22.1. County Land Use Policies. Support the continuation of adopted County land use policies for the unincorporated areas in order to: a) promote a productive, primarily agricultural rural area; and b) balance the needs of rural residents and landowners and the needs for effective natural resource management, enhanced rural scenic quality, and lands for planned urban growth, rural activities, and long-term open space. ▪ Policy TR-2.2. Integrated Land Use/Transportation Planning. Integrate planning for land use and transportation development by ensuring that the timing, amount, and location of urban development is consistent with the development of the transportation system capacity. Promote environmental objectives that supports smart growth and Sustainable Communities principles, such as safe and uncongested neighborhoods, a pedestrian-friendly vibrant downtown that emphasizes non-auto transportation modes, energy conservation, reduction of air and noise pollution, and the integrity of scenic and/or hillside areas. ▪ Policy TR-7.1. Planning for High-Speed Rail. Remain actively engaged in planning efforts for High-Speed Rail service to minimize local impacts and ensure that design is consistent with local plans and policies. ▪ Policy TR-7.2. Neighborhood Impacts. When examining potential impacts of High Speed Rail alternatives and proposals, attention shall be given to all Morgan Hill neighborhoods and mitigation measures shall be proportionate to identified impacts. ▪ Policy NRE-1.4. South County Open Space. Preserve and maintain the wide variety of open spaces in the South County; including greenbelt areas, parks, and agricultural uses. ▪ Policy NRE-4.9. Require new urban development adjacent to an existing agricultural operation to create an appropriate buffer area, on land within the proposed development, between urban uses and agricultural activities.

Plan and Policies	Summary
City of Gilroy	
City of Gilroy 2002–2020 General Plan (2002)	The *City of Gilroy 2002-2020 General Plan* was adopted in 2002. The following goals and policies are relevant to the project: ▪ Community Design and Development Policy 1.01. Pattern of Development. Ensure an orderly, contiguous pattern of development that prioritizes infill development, phases new development, encourages compactness and efficiency, preserves surrounding open space and agricultural resources, and avoids land use incompatibilities. ▪ Community Design and Development Policy 1.03. Uses East of Highway 101. Restrict lands east of Highway 101 to industrial and agricultural use except for (1) commercial developments that draw a clear majority of customers from outside of Gilroy, in accordance with criteria established by the City of Gilroy; and (2) public and quasi-public facilities identified on the Land Use Plan Map. The City will encourage the maintenance of agricultural uses in all undeveloped industrially designated areas. Residential care facilities will only be allowed in the area east of Highway 101 if they meet the criteria set forth in Policy 14.05, Residential Care Facilities for Seniors. ▪ Community Design and Development Policy 1.05. Existing Neighborhoods. Maintain and enhance the quality of existing residential neighborhoods, ensuring adequate public facilities such as parks, schools, streets, water supply, and drainage. Protect residential neighborhoods from excessive noise and traffic impacts; provide pedestrian and bicycle circulation facilities to encourage walking and biking; and work with VTA to provide adequate levels of transit service to meet resident needs. Encourage infill developments that enhance neighborhood quality, supporting community input and participation in the planning and design of large infill projects or projects that propose non-residential, neighborhood-serving uses (such as neighborhood commercial uses). Infill development in existing residential neighborhoods should follow similar design guidelines as those outlined for new neighborhoods in the Neighborhood Districts text on pages 3-8through 3-14. ▪ Community Design and Development Policy 3.25. Mix of Uses Downtown. Encourage a wide mix of uses in close proximity to each other in the Downtown area, including governmental services and facilities, cultural and recreational activities, a broad range of retail activities, financial and professional services, entertainment, transit services, and housing for residents. Encourage mixed use developments that integrate housing and commercial uses.
Measure H – Gilroy Urban Growth Boundary Initiative (2016)	Measure H was passed by the voters of the City of Gilroy in November 2016 to designate an Urban Growth Boundary on the General Plan Land Use Map. Land outside the UGB is designated as Open Space and land uses cannot be changed without voter approval.
Downtown Gilroy Specific Plan (2005)	The *Downtown Gilroy Specific Plan* was adopted in 2005 and contains the following goals and policies relevant to land use: ▪ Encourage higher density projects if the projects are consistent with the existing character and feel of Downtown Gilroy. ▪ Locate the highest density projects at focal points within Downtown Gilroy or on adjacent parcels where connectivity, scale, and texture make these projects appropriate. ▪ Encourage the creation of pedestrian connections within, as well as to and from, the Downtown area.

Plan and Policies	Summary
	▪ Capitalize on the proximity of the Caltrain commuter population and promote linkages to the Downtown through use of signs, etc.
San Benito County	
San Benito County 2035 General Plan (2015)	The *San Benito County 2035 General Plan* was adopted in 2015. The following goals and policies are relevant to the project: ▪ Policy C-3.2 Future Connections to High Speed Rail. The County shall pursue potential opportunities to connect transit to future high-speed rail if a high speed rail station is built in Gilroy and ensure that proposed connection alignments are carefully planned to maximize accessibility and minimize related environmental impacts associated with visual obstructions and noise, as appropriate. ▪ Policy NCR-1.1 Maintenance of Open Space. The County shall support and encourage maintenance of open space lands that support natural resources, agricultural resources, recreation, tribal resources, wildlife habitat, water management, scenic quality, and other beneficial uses.
Merced County	
2030 Merced County General Plan (2013)	The *2030 Merced County General Plan* was adopted in 2013. The following goals and policies are relevant to the project: ▪ LU-2.3. Land Use Activity Limitations (RDR) -- Limit allowed land use within Agricultural and Foothill Pasture areas to agricultural crop production, farm support operations, and grazing and open space uses. ▪ Policy CIR-5.5: Work with other agencies to plan railroad corridors that facilitate the preservation of important rail line right-of-way for further rail expansion or other appropriate transportation facilities. ▪ Policy CIR-5.7: High Speed Rail. Coordinate with the California High Speed Rail Authority, the cities, and other local agencies in efforts to properly locate the High Speed Rail corridors throughout Merced County, including at least one station and a heavy maintenance facility.
2014–2020 Regional Transportation Plan and Sustainable Communities Strategy for Merced County (2016)	The *2014-2020 Regional Transportation Plan and Sustainable Communities Strategy for Merced County* was adopted in 2014. The following goals and policies are relevant to the project: ▪ Policy 3.2. Establish a High Speed Rail system connecting Merced and Los Banos to Sacramento and the Bay Area. ▪ Policy 3.2.1. Support the High Speed Rail planning process and actively provide comments and input.
Merced County Code, Title 18 Zoning, Chapter 18.02 Agricultural Zones	Chapter 18.02 designates agricultural zones and permitted uses allowed therein. These expressly include the following transportation and communication uses: ▪ Airport/airstrip (public or private) ▪ Communication equipment, electrical distribution/transmission substation ▪ Television, radio, cellular communication, microwave towers (excluding studios) ▪ Transportation, equipment yard ▪ Truck parking

Agricultural Farmland

Table 14 Regional and Local Plans and Policies Relevant to Agricultural Farmland

Plans and Policies	Summary
San Francisco Bay Area	
Plan Bay Area 2040 (2017)	The Association of Bay Area Governments and the Metropolitan Transportation Commission adopted *Plan Bay Area 2040* on July 16, 2017. It is a regional housing and transportation plan for the nine-county San Francisco Bay Area. The plan includes the following goal and target relevant to agricultural resources: **Goal**: Open Space and Agricultural Preservation. ▪ Target: Direct development within urban footprint. Only 10 percent of the plan's investments are directed toward expanding capacity-constrained freeways and transit lines. This stems from a "fix it first" emphasis, with an intent to shift travel mode [from car-centric transportation] and achieve the plan's open space and agricultural preservation target.
Moving Forward 2035 Monterey Bay (2017)	The Association of Monterey Bay Area Governments adopted the 2035 Metropolitan Transportation Plan/Sustainable Communities Strategy, also known as *Moving Forward 2034 Monterey Bay*, in June 2014, and was amended in January 2017.It is a regional transportation plan for Monterey County, San Benito County, and Santa Cruz County. The plan includes the following goals and policies that are relevant to agricultural resources: ▪ Environment- Promote environmental sustainability and protect the natural environment ▪ Healthy Communities- Protect the health of our residents; foster efficient development patterns that optimize travel, housing, and employment choices and encourage active transportation.
Santa Clara County	
Santa Clara County General Plan, 1995–2010 (1994)[a]	The *Santa Clara County General Plan, 1995–2010* was adopted on December 20, 1994. The plan contains the following strategies and policies relevant to agricultural resources: **Role of Agriculture** Strategy #1: Inventory, Map and Monitor the Status of Agricultural lands Strategy #2: Maintain Stable Long Range Land Use Patterns Strategy #3: Enhance the Long Term Economic Viability of Agriculture ▪ **Policy C-RC 37**: Agriculture should be encouraged and agricultural lands retained for their vital contributions to the overall economy, quality of life, and for their functional importance to Santa Clara County, in particular: a. local food production capability; b. productive use land not intended for urban development; and c. protection of public health and safety. ▪ **Policy C-RC 40**. Long term land use stability and dependability to preserve agriculture shall be maintained and enhanced by the following general means: b. regulating non-agricultural uses in agricultural areas, and their intensity and impacts on adjacent lands;

Plans and Policies	Summary
	c. maintaining agriculturally-viable parcel sizes; and d. minimizing conflicts between adjacent agricultural and non-agricultural land uses, through such means as right-to-farm legislation and mediation of nuisance claims. **Growth and Development** Strategy #1: Preserve the Resources and Character of Rural Lands ▪ ***R-GD 1.*** Strategies and policies for managing land use and development in the rural unincorporated areas include the following: 1. Preserve the resources and rural character of lands outside Urban Service Areas (USAs). 2. Develop special area plans for areas that require or would benefit from more detailed planning and policies. ▪ ***R-GD 3.*** Land uses and development permitted under County jurisdiction shall be consistent with the following major County policies: e. preservation of agriculture **Resource Conservation** Agriculture & Agricultural Resources ▪ ***R-RC 57.*** Agriculture shall be encouraged and prime agricultural lands retained for their value to the overall economy and quality of life of Santa Clara County, including: a. local food production capability; b. productive use of lands not intended or suitable for urban development; and, c. preservation of a diminishing natural resource, prime agricultural soils. Strategy #2: Maintain Stable, Long Range Land Use Patterns ▪ **R-RC 40.** Long term land use stability and dependability to preserve agriculture shall be maintained and enhanced by the following general means: a. limiting the loss of valuable farmland from unnecessary and/or premature urban expansion and development; b. regulating non-agricultural uses in agricultural areas, and their intensity and impacts on adjacent lands; c. maintaining agriculturally-viable parcel sizes; and d. minimizing conflicts between adjacent agricultural and non-agricultural land uses, through such means as right-to-farm legislation and mediation of nuisance claims. ▪ ***R-RC 59.*** Sizeable remaining areas of agricultural lands shall be preserved in large parcels in order to: a. stabilize long term land use patterns; b. allow for long term agricultural investment; c. facilitate entry of individuals into agricultural livelihoods; and d. avoid introduction of incompatible residential or other development in agriculture areas. ▪ ***R-RC 60.*** Recombining of parcels in agricultural areas should be encouraged. ▪ ***R-RC 61.*** Allowable land uses in exclusive agricultural areas shall be limited to

Plans and Policies	Summary
	a. agriculture and ancillary uses, b. uses necessary to directly support local agriculture, and c. other uses compatible with agriculture which clearly enhance the long term viability of local agriculture and agricultural lands. ▪ ***R-RC 64.*** As the means and resources become available, agricultural areas of greatest long term viability should be designated for long term or possibly permanent preservation from urban development. Areas such as the lands south and east of Gilroy should be considered for designation and preservation. Strategy #3: Enhance the Long Term Economic Viability of Agriculture ▪ ***R-RC 65.*** The long term economic viability of agricultural activities shall be maintained and enhanced by promoting: a. improved markets for locally-grown products; b. Williamson Act provisions for property tax relief; c. use of innovative, more cost-efficient growing techniques; d. review of the economic impacts of regulation and other means of enhancing competitiveness; and e. adequate agricultural worker housing. ▪ ***R-RC-66.*** Williamson Act contracts for the preservation of agriculture and agricultural lands should be promoted and maintained. Requests for immediate contract cancellation should be denied except in cases of unusual circumstances or hardship. **Land Use** Description and Intent ▪ ***R-LU 3.*** The general intent of each 'Resource Conservation Area' designation is to encourage land uses and densities appropriate to the rural unincorporated areas that also: d. preserve agriculture and prime agricultural soils ▪ **Policy R-LU 8**. Santa Clara County is enriched by a special combination of the very finest soils, a very favorable, dependable growing climate, and generally adequate water supplies. Lands in agricultural uses contribute to the economy and quality of life enjoyed by county residents. This combination of factors makes it highly desirable that certain lands be preserved for their intrinsic value as agricultural land and for productive agricultural land uses. ▪ ***R-LU 9.*** For those areas of greatest long term viability for agriculture and highest quality soils, permanent preservation as agricultural land is the ultimate goal. Other areas are designated 'Agriculture' in order to: a. encourage productive use of lands not currently planned for city development, or b. preserve lands in agricultural uses where physical limitations, such as frequent flooding or high ground water conditions, make them unsuitable for other uses. Allowable Uses ▪ ***R-LU 11.*** Allowable land uses shall be limited to: a. agriculture and ancillary uses; b. uses necessary to directly support local agriculture; and

Plans and Policies	Summary
	c. other uses compatible with agriculture which clearly enhance the long term viability of local agriculture and agricultural lands. Allowable Densities ▪ ***R-LU 14.*** For areas designated 'Agriculture-Large Scale,' minimum parcel sizes shall be no less than 40 acres. ▪ ***R-LU 15.*** For areas designated 'Agriculture-Medium Scale,' minimum parcel sizes shall be no less than 20 acres. **South County Area Joint Plan** ▪ ***SC 0.3.*** The South County Joint Area Plan shall apply to the incorporated and unincorporated areas south of the Morgan Hill - San Jose boundary agreement line approved by LAFCO. The Joint Area Plan also includes policies relating to the Coyote Valley, since it is within the Morgan Hill Unified School District and has an impact upon the South County due to its strategic location. Agriculture ▪ ***SC 14.2.*** Agricultural lands should be protected from encroachment by incompatible land uses. ▪ ***SC 14.4.*** Some prime agricultural lands in South County (particularly within the prime agricultural areas east and south of Gilroy) should be preserved for agricultural use.
Santa Clara County Code of Ordinances (2018)	Title 18 Zoning, Chapter 18.08 Regulations for A- Agricultural Zoning Districts. Chapter 18.08 designates agricultural zones and permitted uses allowed therein.
Santa Clara Valley Agricultural Plan (2018)	The County of Santa Clara and the Santa Clara Valley Open Space Authority, along with multiple partner agencies and individuals, created the *Santa Clara Valley Agricultural Plan 2018*. The plan includes the following objectives, strategies, and actions relevant to agricultural resources. **Focus Area: Land Use Policy** ▪ **Objective 1:** Recognize Viable Agricultural Lands and Sub-Areas Within the County General Plan and Zoning Ordinance. Strategies / Actions a. Extend Agricultural zoning to encompass all viable agricultural lands. b. Consider designation of agricultural zoning regions specific to sub-areas in the Agricultural Resource Area (ARA) that share a common identity, for focused application of agricultural protection tools. c. Coordinate with neighboring Santa Clara Valley cities to create consistency in the designation of agricultural areas between the County and Cities' General Plans. ▪ **Objective 2:** Prevent the Conversion of Agricultural Lands to Non-Agricultural Uses Within the Rural Areas. Strategies / Actions a. Prevent the establishment of incompatible uses within the ARA which increase land speculation and impair ongoing agricultural production. b. Prevent conversion of agricultural lands into rural ranchettes that increase land speculation and reduce viability of ongoing neighboring farm operations.

Plans and Policies	Summary
	c. Enact a County-wide agricultural mitigation fee that requires a mitigation fee for development that converts viable agricultural land to other uses. ▪ **Objective 4:** Reduce Conflict Between Incompatible Uses and Agriculture Within Agricultural Areas. Strategies / Actions a. Require setbacks/buffers for new non-agricultural development within or adjacent to agricultural lands to reduce interface between incompatible land uses and farming. b. Strengthen right-to-farm requirements. **Focus Area: Regional Agricultural Conservation Easement Program and Other Voluntary Financial Incentives** ▪ **Objective 5:** Establish a Regional Agricultural Conservation Easement Purchasing Program for the Santa Clara Valley. Strategies / Actions a. Establish a Regional ACE Purchasing Program. ▪ **Objective 6:** Encourage Landowners to Take Advantage of Property Tax Incentives to Keep Land in Agriculture. Strategies / Actions a. Increase participation in the County's Williamson Act Program and Establish a Farmland Security Zone Program. ▪ **Objective 7:** Identify Opportunities and Create Programs that Provide Financial Compensation to Farmers for Providing Ecosystem Benefits (GHG Reduction, Groundwater and Floodplain Protection) Through Farming. Strategies / Actions a. One of the most important means to protect the local agricultural land base is to help ensure that farmers and ranchers can stay profitable over the long-term, reducing the pressure to sell land for development. **Focus Area: Agricultural Economic Development Strategy** ▪ **Objective 8:** Support the viability of the agricultural economy. Strategies / Actions a. Support farmers in obtaining permits and regulatory compliance associated with actions and activities that support long term agricultural investment and growth of the agricultural economy. ▪ **Objective 9:** Improve the Climate for the Growth of a Diverse, Vibrant, and Innovative Agriculture Economy. Strategies / Actions a. Create an Agricultural Enterprise Program for specific sub-areas of the ARA. b. Coordinate and support the small farms initiative effort under way by the SCC Food Systems Alliance. c. Support expansion of ag tourism. d. Address the need for additional distribution and processing space for agricultural products; include assessment of "hubs" for co-located businesses.

Plans and Policies	Summary
	▪ **Objective 10:** Support the Growth of New Farms and Creation of New Farmers to Provide Diversity and Long-Term Resiliency in the Local Agricultural Economy. Strategies / Actions a. Address the needs of beginning and immigrant farmers, currently in the Country or interested in starting farming operations in the County, for land access, technical assistance and financial assistance. b. Develop an action plan for implementation of a Farm Incubator or AgPark, with related programs.
Santa Clara Valley GreenPrint (2014)	The Santa Clara Valley Open Space Authority developed the *Santa Clara Valley Green Print*, a 30-year roadmap for the Authority which identifies goals, priorities, and strategies for land conservation. **Goal: Conserve farms, ranches, and other working landscapes to sustain the economic viability of local agriculture.** **Strategies for Protecting Farms, Ranches, and Other Working Lands** 1. Protect farms and ranches through fee purchase, conservation easements, and other incentives. a. Partner with local and regional conservation organizations to secure funding for regionally significant farm and ranch protection projects with a focus on (1) farms and ranches that demonstrate long-term economic viability and operational adaptability, and that provide multiple environmental benefits and (2) urban-edge farmlands threatened by conversion to non-agricultural uses. b. Increase the Authority's funding and staffing capacity to manage conservation easements by developing program guidelines and mitigation policies. c. Explore the use of new conservation tools to help make farming economically viable, such as affirmative easements, right to purchase at farm value, and payment for ecosystem service programs. d. As new funding becomes available, develop a matching grant program to fund local Resource Conservation Districts, UC Cooperative Extension, land trusts, or other nonprofit conservation partners that assist farmers and ranchers with agricultural and natural resource protection projects. f. Work with conservation partners to conduct outreach to agricultural landowners to raise awareness about the Authority's conservation programs. 2. Manage Open Space Authority lands for natural resource protection and viable agricultural operations, and to model effective public-private partnerships. a. Engage experts to develop comprehensive management plans for Authority properties and easements that integrate agricultural and natural resources. b. Work with the Natural Resources Conservation Service, Resource Conservation Districts, and other partners to share best practices for land management and secure funding to implement farm and rangeland conservation projects on Authority preserves and nearby private lands that enhance water quality, habitat protection, carbon sequestration, and other ecosystem services.

Plans and Policies	Summary
	c. Demonstrate and interpret successful conservation practices on Authority lands, such as hedgerows, sediment basins, irrigation efficiency projects, or other climate-smart projects. d. Explore opportunities for beginning farmers to lease Authority agricultural lands, for example, through California FarmLink. Offer competitive leases and long-term land security in exchange for tenants' commitment to implementing on-farm conservation and stewardship projects. 4. Engage in local, regional, and state land use planning and policy projects to promote farm and rangeland protection and the economic viability of regional agriculture. a. Work with the Santa Clara County Local Agency Formation Commission (LAFCO), the County, and cities to maintain and strengthen agricultural zoning, maintain effective urban growth boundaries, and develop and implement effective agricultural mitigation policies and projects. b. Work with state legislators to restore funding for the Williamson Act (including a focus on urban-edge farms, which are grossly underrepresented in Williamson Act contracts) and engage County leadership to secure funding and provide incentives, such as transportation project mitigation, and urban agriculture incentive zones to increase agricultural viability and protect open space. c. Advocate for agricultural tax credits such as California's Natural Heritage Tax Credit program. e. Initiate multi-benefit agricultural conservation projects that contribute to groundwater recharge and water supplies, water quality, and flood risk reduction. g. Advocate for a portion of AB 32 cap-and-trade revenues to be directed to farmland conservation. h. Strengthen SB 375 to integrate agricultural protection into the local Sustainable Communities Strategy (Plan Bay Area) and to promote agricultural protection within Association of Bay Area Government (ABAG) Priority Conservation Areas. i. Support adoption of minimum statewide standards for mitigating the loss of farmland when a project results in the conversion of farmland to non-agricultural uses. j. Engage with transportation projects needing agricultural mitigation, such as the High Speed Rail and highway widening projects. k. Support implementation of a local agricultural enterprise zone to use tax benefits to incentivize farmland protection and value-added farm enterprises
Pajaro River Watershed Integrated Regional Water Management Plan (2014)	The Pajaro Valley Water Management Agency, San Benito County Water District, and Santa Clara Valley Water District collaborated to create the *Pajaro River Watershed Integrated Regional Water Management Plan* which identifies regional and multi-beneficial projects for the Pajaro River Watershed. The plan includes the following goals and objectives and strategies relevant to agricultural resources: **Flood Protection Goal:** Ensure flood management strategies are developed and implemented through a collaborative and watershed-wide approach and are designed to maximize opportunities for comprehensive management of water resources.

Plans and Policies	Summary
	Objectives: 2. Reach consensus on the Pajaro River Risk Reduction Project necessary to protect existing urban areas and infrastructure from flooding and erosion from the 100-year event and to maximize opportunities to protect agricultural land uses. 5. Provide community benefits beyond flood protection such as public access, open space, recreation, agriculture preservation and economic development
City of Santa Clara	
City of Santa Clara 2010–2035 General Plan (2010)	The *City of Santa Clara 2010–2035 General Plan* was adopted November 16, 2010, and Land Use policies were updated December 9, 2014. The plan does not include goals or policies relevant to agricultural resources.
City of San Jose	
Envision San José 2040 (2011)	*Envision San José 2040* was adopted November 1, 2011. The Land Use and Transportation chapter includes the following goals, policies, and actions relevant to agricultural resources: **Goal LU-12**—Urban Agriculture. Expand the cultivation and sale of locally grown agriculture as an environmentally sustainable means of food production and as a source of healthy food for San José residents. ▪ ***LU-12.3.*** Protect and preserve the remaining farmlands within San José's sphere of influence that are not planned for urbanization in the timeframe of the Envision General Plan, such as mid- and south Coyote Valley, through the following means: o Limit residential uses in agricultural areas to those which are incidental to agriculture. o Restrict and discourage subdivision of agricultural lands. o Encourage contractual protection for agricultural lands, such as Williamson Act contracts, agricultural conservation easements, transfers of development rights, or other property tax relief measures as incentives for preservation of these lands. o Restrict land uses within and adjacent to agricultural lands, such as Williamson Act contracts, agricultural conservation easements, and transfers of development rights. o Prohibit land uses within or adjacent to agricultural lands that would compromise the viability of these lands for agricultural uses. o Strictly maintain the Urban Growth Boundary in accordance with other goals and policies in this Plan. ▪ ***LU-12.4.*** Preserve agricultural lands and prime soils in non-urban areas in order to retain the aquifer recharge capacity of these lands. **Goal LU-20** – Rural Agriculture. Provide and protect sufficient agricultural land to facilitate local food production, to provide broad community access to healthful foods, to add to a distinct community image, and to promote environmental, fiscal, and economic benefits of rural agricultural lands. ▪ ***LU-20.1.*** Protect and preserve the remaining farmlands within San Jose's sphere of influence that are not planned for urbanization in the timeframe of the Envision General Plan, such as mid- and south Coyote Valley, through the following means:

Plans and Policies	Summary
	1. Strongly discourage conversion of agricultural lands outside the Urban Growth Boundary to non-agricultural uses. 2. Limit residential uses in agricultural areas to those which are incidental to agriculture. 3. Prohibit subdivision of agricultural lands, unless it can be established that the subdivision would not reduce the overall agricultural productivity of the land and that viable agricultural operations would be sustained. 4. Encourage contractual protection for agricultural lands, such as Williamson Act contracts, agricultural conservation easements, transfers of development rights, or other property tax relief measures as incentives for preservation of these lands. 5. Restrict land uses within and adjacent to agricultural lands that would compromise the agricultural viability of these lands. Require new adjacent land uses to mitigate any impacts on the use of agricultural lands. 6. Require ancillary non-agricultural land uses on agricultural lands to be ancillary to and compatible with agricultural land uses, agricultural production, and the rural character of the area, and to enhance the economic viability of agricultural operations. ▪ ***LU-20.2.*** Preserve agricultural lands and prime soils in non-urban areas in order to provide local and regional fresh food supplies, reduce dependence on foreign products, conserve energy, and retain the aquifer recharge capacity of these lands. ▪ ***LU-20.9.*** Explore use of agricultural easements, transfer/purchase of development rights, or other options to keep Mid-Coyote Valley as permanent agriculture.
Communications Hill Specific Plan (1992)	The City of San Jose adopted the *Communications Hill Specific Plan* in 1992. It is a specific plan incorporated into the City's General Plan. The following objectives are relevant to agricultural resources: ▪ To provide a comprehensive planning framework for development of an urban high-density, pedestrian-oriented, community with a mix of uses. ▪ To make the most of the natural amenities within the area including the panoramic views available from the hill.
San Jose Municipal Code (2018)	Title 20 Zoning, Chapter 20.20 Open Space & Agricultural Zoning Districts. Chapter 20.20 designates agricultural zones and permitted uses allowed therein.
City of Morgan Hill	
Morgan Hill 2035 General Plan (2016)	The *Morgan Hill 2035 General Plan* was adopted on July 27, 2016. The plan includes the following goals and policies relevant to agricultural resources: **Goal CNF-20**. Sustainable growth in the East of 101 Area Plan Overlay District ▪ ***CNF-20.4.*** **East of 101 Area Integrated Agriculture.** Strongly encourage new development to preserve existing agricultural uses as feasible and integrate agricultural features into new development to reflect the history of this area. **Goal CNF-21**. Effective, stable growth of the South County ▪ ***CNF-21.1.*** County Land Use Policies. Support the continuation of adopted County land use policies for the unincorporated areas in order to:

Plans and Policies	Summary
	a) promote a productive, primarily agricultural rural area; and b) balance the needs of rural residents and landowners and the needs for effective natural resource management, enhanced rural scenic quality, and lands for planned urban growth, rural activities, and long-term open space. **Goal NRE-1**. Preservation of open space areas and natural features ▪ ***NRE-1.2.*** Large Open Space Areas. Work with the County, the Open Space Authority, appropriate conservancy organizations and land trusts, and property owners to preserve large open space areas, such as agricultural lands and outdoor recreation areas, to conserve natural resources and retain the City's unique identity. ▪ ***NRE-1.4.*** South County Open Space. Preserve and maintain the wide variety of open spaces in the South County; including greenbelt areas, parks, and agricultural uses. **Goal NRE-4**. A viable agricultural industry ▪ ***NRE-4.3.*** Agriculture in the Sphere of Influence**.** Support significant agricultural activity within the Sphere of Influence by providing a market for agricultural products (e.g., farmers' markets) and decreasing the costs associated with agriculture by allowing such uses to occur in the Sphere of Influence. ▪ ***NRE-4.7.*** Long-Term Maintenance of Agriculture. Continue to support the long-term maintenance of agricultural land uses and agriculture, including vineyards and wineries, as an economic enterprise in South County. ▪ ***NRE-4.8.*** Policy Support for Agriculture. Take positive action to encourage agriculture by supporting local, county, and State policies favorable to agriculture. ▪ ***NRE-4.9.*** Require new urban development adjacent to an existing agricultural operation to create an appropriate buffer area, on land within the proposed development, between urban uses and agricultural activities. ▪ ***NRE-4.10.*** Land Use to Support Agricultural Viability. Maintain the economic viability of agriculture using a variety of methods, such as: o Designating land outside urban areas as agricultural; o Requiring minimum lot sizes in agricultural areas; o Requiring land uses that support agricultural activities; o Marketing the benefits of agricultural uses to the public. ▪ ***NRE-4.11.*** Agricultural Mitigation. Enforce the agricultural mitigation requirement of requiring the preservation of a minimum of 1 acre of agricultural land for each acre of agricultural land changed to a non-agricultural use. ▪ ***NRE-4.13.*** Urban Growth. Wherever existing development patterns and existing and planned roads and other public facilities permit, concentrate urban development adjacent to existing developed areas in order to minimize the impact of development on agricultural land. Plan for further urban growth to occur in areas which will avoid encroachment into those agricultural lands with the greatest long-term potential to remain economically viable. ▪ ***NRE-4.17***. Williamson Act Contracts. Support the preservation of land under Williamson Act contracts within the Morgan Hill Sphere of Influence.

Plans and Policies	Summary
Morgan Hill Agricultural Lands Preservation Program (2014)	The *Morgan Hills Agricultural Lands Preservation Program* was adopted on November 5, 2014. The program is intended to promote continued agricultural activities in and around Morgan Hill through land use policies and implementation activities. The plan includes the following goals and policies relevant to agricultural resources: **Goals** 1. Preserve open space agricultural lands and agricultural activity within the Morgan Hill Sphere of Influence. 5. Focus land preservation in the City's Southeast Quadrant area, but also encourage preservation efforts throughout the City's Sphere of Influence. **Policies** 4. Mitigation Ratio. A minimum of one (1) acre of Agricultural Land (1:1 mitigation ratio) shall be preserved for each acre of Agricultural Land changed to a non-agricultural use.
Morgan Hill Municipal Code (2018)	Title 18 Zoning, Chapter 18.85 Agricultural Mitigation. Chapter 18.85 designates agricultural zones and permitted uses allowed therein.
Morgan Hill ZA-14-11 Agricultural Mitigation Ordinance (2015)	The City of Morgan Hill's Ordinance ZA-14-11 was adopted into law on August 5, 2015 (Chapter 18.85.010—Agricultural lands preservation program). It codifies the goals and policies of the Agricultural Lands Preservation Program of 2014. The policies of the program and thus of the ordinance accomplish the following goals relevant to agricultural resources: 1. Preserve open space agricultural lands and agricultural activity within the Morgan Hill sphere of influence. 5. Focus land preservation in the city's southeast quadrant.
City of Gilroy	
Gilroy 2020 General Plan (2002)	The *Gilroy 2020 General Plan* was adopted on Jun 13, 2002. The plan contains the following goal and policies relevant to agricultural resources: **Community Design and Development** **Goal**: Continued viability of agriculture and agri-tourism in the Gilroy area through (a) recognition of agriculture's significant contribution to the local economy; (b) protection of agricultural lands from urban encroachment; (c) preservation of agricultural lands as a natural buffer between Gilroy and surrounding communities; and (d) appreciation for the role of agricultural lands in enhancing Gilroy's semi-rural, smalltown character. ▪ ***4.02.*** Agricultural Land Preservation. Work with the County, LAFCo, and other relevant agencies as well as private landowners to protect agricultural and grazing lands from encroachment by urban uses, and to encourage the use of such lands for active cultivation. Specifically, implement the strategies and actions recommended by the South County Agricultural Study (*Strategies to Balance Planned Growth and Agricultural Viability in the Areas South and East of Gilroy*, October 1996). ▪ ***4.05.*** Agricultural Uses within the Planning Area. Recognize and encourage agriculture as a compatible use in undeveloped portions of the Planning Area. Community gardens, food production, seed production and other intensive agricultural operations will be allowed as long term uses when compatible with adjacent existing or planned land use.
Gilroy City Code (2018)	Chapter 30 Zoning, Section 30.4 Agricultural and Rural Residential District. Chapter 30.4 designates agricultural zones and permitted uses allowed therein. Additionally, Chapter 3A, Agricultural Disclosure and Dispute

Plans and Policies	Summary
	Resolution, provides clarification on disputes between rural residential and agricultural land operations that are adjacent.
San Benito County	
2035 San Benito County General Plan (2015)	The *2035 San Benito County General Plan* was adopted on July 21, 2015. The plan contains the following goals and policies relevant to agricultural resources: **Land Use** **Goal LU-3**. To ensure the long-term preservation of the agricultural industry, agricultural support services, and rangeland resources by protecting these areas from incompatible urban uses and allowing farmers to manage their land and operations in an efficient, economically viable manner. ▪ **Policy *LU-3.1.*** Agricultural Diversification. The County shall support existing farms, vineyards, and other agricultural operations and encourage the agricultural industry to continue diversification that includes organic, value-added, small-scale, sustainable, and community-supported agricultural practices throughout the county. ▪ **Policy *LU-3.2.*** Agricultural Integrity and Flexibility. The County shall protect the integrity of existing agricultural resources, and provide for flexibility and economic viability of farming and ranching operations. ▪ **Policy LU-3.9**. Right to Farm and Ranch. The County shall protect the rights of operators of productive agricultural properties (as defined in the Glossary) and ranching properties to commence and continue their agricultural and ranching practices (a "right to farm and ranch") even though established urban uses in the general area may foster complaints against those agricultural and ranching practices. The "right to farm and ranch" shall encompass the processing of agricultural and ranching products and other activities inherent in the definition of productive agriculture and in ranching activities. The County shall require all parcel maps approved for locations in or adjacent to productive agricultural areas and ranching areas to indicate the "right to farm and ranch" policy. The County shall require the program to be disclosed to buyers of property in San Benito County. ▪ **Policy *LU-3.10.*** Agricultural Land Mitigation. If new development permanently converts Prime Farmland that is Class 1 soil to non-agricultural uses, the County shall encourage project applicants to preserve up to an equal number of Prime Farmland acres (i.e. up to a 1:1 ratio) either on- or off-site. An applicant may pay an in lieu mitigation fee(s) for some or all of the converted Prime Farmland that is designated Class 1 soils to nonagricultural uses as agreed in a development agreement. ▪ **Policy LU-3.12**. Agricultural Viability of Small Parcel Sizes. The County shall require project applicants seeking to subdivide agriculturally-zoned parcels to demonstrate the continued viability of lots less than 40 acres for commercial agriculture operations. ▪ **Policy *LU-3.14.*** Land Trusts and Financial Incentives. The County shall consider land trusts and financial incentives to preserve agricultural soil resources and to protect the integrity of important agricultural areas for future use. ▪ **Policy *LU-3.15.*** Williamson Act Minimum Parcel Size. For parcels not operating as part of a larger farming operation, the County shall encourage larger parcel size minimums (40 or more acres) and/or evidence of commercial agricultural use for entering new Williamson Act contracts.

Plans and Policies	Summary
	Natural and Cultural Resources Element **Goal NCR-1**. To preserve and enhance valuable open space lands that provide wildlife habitat and conserve natural, historical, archaeological, paleontological, tribal, and visual resources of San Benito County. ▪ **Policy *NCR-1.1.*** Maintenance of Open Space. The County shall support and encourage maintenance of open space lands that support natural resources, agricultural resources, recreation, tribal resources, wildlife habitat, water management, scenic quality, and other beneficial uses.
San Benito County Code of Ordinances (2018)	Title 25 Zoning, Section 25.07 Agricultural Districts. Chapter 25.07 designates agricultural zones and permitted uses allowed therein. Additionally, Title 19 Land Use and Environmental Regulations, Chapter 19.01 Agricultural Provisions, provides details on agricultural community disclosure and agricultural preserves.
Merced County	
2030 Merced County General Plan (2013)	The *2030 Merced County General Plan* was adopted on December 10, 2013, updating the previous version of the general plan that was included in Section 3.14, Agricultural Lands (page 3.14-4) of the Merced to Fresno Final EIR/EIS (Authority and FRA 2012). The plan includes the following goals and policies relevant to agricultural resources: **Goal AG-2**. Ensure the long-term preservation and conservation of land used for productive agriculture, potentially-productive agricultural land, and agricultural-support facilities. ▪ Policy AG-2.1: Protect agriculturally-designated areas and direct urban growth away from productive agricultural lands into cities, urban communities, and new towns. ▪ Policy AG-2.2: Protect productive agricultural areas from conversion to nonagricultural and urban uses by establishing and implementing an agricultural mitigation program that matches acres converted with farmland acres of similar quality to those converted preserved at a 1:1 ratio. Coordinate with the six cities in Merced County and the Merced LAFCo, consistent with LAFCo's statutory mission to preserve agricultural land and open space, to establish consistent standards and mitigation for the loss of farmland. In addition, the LESA model may be used to determine whether the conservation land is of equal or greater value than the land being converted. ▪ Policy AG-2.4: Encourage property owner participation in programs that preserve farmland, including the Williamson Act, conservation easements, and USDA-funded conservation practices. ▪ Policy AG-2.9: Oppose the extension of urban services, such as sewer lines, water lines, or other urban infrastructure, into areas designated for agricultural use, unless necessary to protect public health, safety, and welfare. ▪ Policy AG-2.13: Require a 20 acre minimum permitted parcel size in areas designated Agricultural to discourage land divisions for rural residential purposes and maintain parcels large enough for efficient commercial agriculture production. Require 160 acre minimum permitted parcel size in areas designated Foothill Pasture and in grassland areas. ▪ Policy AG-2.14: Require applicants seeking to divide agriculturally-zoned parcels to demonstrate the continued viability of lots less than 40 acres for commercial agriculture, using specific standards (i.e., access to agricultural

Plans and Policies	Summary
	water, joint farm management, access for aerial spraying, size viability for specific commodities) and farm management plans. ▪ Policy AG-2.16: Coordinate with the California High-Speed Rail Authority to locate the high-speed rail lines along existing major transportation corridors, such as SRs 99 or 152, to minimize the conversion of productive agricultural land to nonagricultural uses. ▪ Policy LU-2.3: Limit allowed land use within Agricultural and Foothill Pasture areas to agricultural crop production, farm support operations, and grazing and open space uses.
Merced County Municipal Code (2018)	Title 18 Zoning, Chapter 18.02 Agricultural Zones. Chapter 18.02 designates agricultural zones and permitted uses allowed therein.
2018 Regional Transportation Plan and Sustainable Communities Strategy for Merced County (2018)	The Merced County Association of Governments adopted the *2018 Regional Transportation Plan and Sustainable Communities Strategy for Merced County* on August 16, 2018. The plan includes the following goals and objectives that are relevant to agricultural resources: ▪ Goal 9 Land Use Development Patterns and Strategies: Provide economical, long-term solutions to transportation problems by encouraging community designs that encourage walking, transit, and bicycling. ▪ Objective 9.1: Innovative land use and transportation planning. ▪ Objective 9.2: Plan future roads to accommodate land uses at a regional level. ▪ Objective 9.4: Preserve productive farmland and land that provides habitat for rare, endangered, or threatened species. ▪ Goal 12 Sustainable Communities: Reduce per capita greenhouse gas emissions through compact growth and alternative transportation strategies. Protect and enhance the natural environment. Support vehicle electrification and the provision of electrification infrastructure in public and private parking facilities and structures.
Santa Nella Community Specific Plan (2000)	The County of Merced adopted the *Santa Nella Community Plan* on May 5, 2000. The plan includes the following goals and objectives that are relevant to agricultural resources: Land Use ▪ Goal 1: Land Use patterns should enhance the integrity of both urban and rural areas. ▪ Goal 3: Plan for a mixture of land uses that meet the residential, commercial, industrial, recreational, cultural, and public service needs of Santa Nella residents. Open Space, Conservation, and Recreation ▪ Goal 2: Soil, water, air, mineral, energy, and historical resources are properly managed. Agriculture ▪ Goal 1: Improve the agricultural sector's financial viability. ▪ Policy 1: Seek the introduction of new agricultural processors in the Santa Nella Industrial Area through consideration of suitable financial mechanisms such as Industrial Revenue Bonds. ▪ Goal 2: Productive agricultural lands are conserved. ▪ Policy 1: Utilize the County General Plan Land Use and Agriculture chapter policies for evaluating proposals to expand the Santa Nella SUDP.

Plans and Policies	Summary
	▪ Goal 3: Assure that potentially disruptive land uses to the agricultural economy are properly located and operated. ▪ Policy 1: Provide land use transitions and buffers between urban and agricultural areas which reduce interference and protect agricultural land from conversion to nonagricultural uses. ▪ Policy 2: Upwind dairies on the fringe or in the path of development should be phased out. ▪ Policy 3: Continue to enforce the County's Right-To-Farm Ordinance on new residents within the fringes of the Santa Nella SUDP as a disclosure of the effects of adjacent farming practices. ▪ Goal 4: Work with local water districts on exchange agreements to use agricultural water for urban use. ▪ Policy 1: Investigate the use of groundwater and intermediate treated wastewater to irrigate adjacent agricultural lands in exchange for fresh surface water supplies for the community.
City of Los Banos	
City of Los Banos 2030 General Plan Update (2009)	The City of Los Banos adopted the *2030 General Plan Update* on July 15, 2009. The plan includes the following goals and implementing policies that are relevant to agricultural resources: Land Use ▪ LU-G-1: Promote a sustainable, balanced land use pattern that satisfies existing needs and safeguards future needs of the City. ▪ LU-I-58: Require residential development adjacent to the Central California Irrigation District Canal/HG Fawcett Parkway to comply with buffer requirements and provide direct public access where feasible. ▪ LU-I-59: Required development to transition in density, with lot sizes increasing to the south as a buffer for the adjoining rural and agricultural districts. Parks, Open Space, and Conservation ▪ POSR-G-8: Promote preservation of agriculture within the Planning Area. ▪ POSR-I-17: Establish priorities for open space preservation and acquisition based on the evaluation of: o Significant natural areas that are historically, ecologically, or scientifically unique or are outstanding, important or threatened; o Wildlife habitats and fragile ecosystems in need of protection; o Watersheds or significant water recharge areas; o Open space for safety and public health; o Lands suitable for recreation such as biking, photography, or nature study; and o Land suitable for agricultural production. ▪ POS-I-25: Establish and maintain a Grasslands Resources Overlay Zone (GROZ) for the inter-canal area between the San Luis Canal and the Santa Fe Canal north of SR-152 where lands within the GROZ (allowing or the bypass) shall remain in agricultural and open space uses. ▪ POSR-I-28: Work with the County and with the Grasslands Water District to preserve agricultural uses outside the Urban Growth Boundary. ▪ POSR-I-30: Require property developers adjacent to sites where agricultural uses are being conducted to inform subsequent buyers of

Plans and Policies	Summary
	potential continued agricultural production and the lawful use of agricultural chemicals, including pesticides and fertilizers. ▪ POSR-1-31: Require anti-vandalism designs (appropriate fencing or other landscape features) to ensure that new development has conditions that minimize increased vandalism of adjacent agricultural activities outside the Urban Growth Boundary.

Parks, Recreation, and Open Space

Table 15 Regional and Local Plans and Policies Relevant to Parks, Recreation, and Open Space

Policy Document	Summary
Santa Clara County	
Santa Clara County General Plan (1994)	The Santa Clara County General Plan was adopted in 1994. The following policies from Part 2, Parks and Recreation Chapter, are relevant to the project extent: ▪ C-PR 2: Sufficient land should be acquired and held in the public domain to satisfy the recreation needs of current and future residents and to implement the trailside concept along our scenic roads. ▪ C-PR 4: The public open space lands system should: (a.) preserve visually and environmentally significant open space resources; and (b.) provide for recreation activities compatible with the enjoyment and preservation of each site's natural resources, with trail linkages to adjacent and nearby regional park lands. ▪ C-PR 7: Opportunities for access to regional parks and public open space lands via public transit, hiking, bicycling, and equestrian trails should be provided. Until public transit service is available, additional parking should be provided where needed. ▪ C-PR-14: Parks and recreation system planning, acquisition, development, and operation should be coordinated among cities, the County, State and Federal governments, school districts and special districts, and should take advantage of opportunities for linkages between adjacent publicly owned parks and open space lands. ▪ C-PR 20.1: Trail access should be provided for a range of user capabilities and needs (including persons with physical limitations) in a manner consistent with State and Federal regulations.
County of Santa Clara Ordinance Code, Division B14, Parks and Recreation (2017)	The Municipal Code consists of local laws and ordinances for parks and recreation enacted and enforced by the local municipality. However, these local laws and ordinances predominantly pertain to rules and regulations for daily use of parks, recreation, and open space. As a result, no local laws and ordinances are applicable to the project extent.
Santa Clara County Countywide Trails Master Plan (1995)	The Santa Clara County Countywide Trails Master Plan was adopted on November 14, 1995. The following policy is relevant to the project extent: ▪ PR-TS 1.2: Trail access should be provided for a range of user capabilities and needs (including persons with physical limitations) in a manner consistent with State and Federal regulations.

Policy Document	Summary
Santa Clara Valley Open Space Authority	
Santa Clara Valley Greenprint (2014)	The Santa Clara Valley Greenprint was adopted on March 27, 2014. The following goals and strategies is relevant to the project extent: ▪ Protect and manage an interconnected system of wildlands and natural areas to support native habitats and species and to ensure resilience to a changing environment. ▪ Protect and manage a network of open space lands that provide opportunities for nature-based recreation and education for all residents. ▪ Protect and maintain connections between large open space parcels to provide large habitat blocks, ensure critical linkages, and provide climate resilience.
City of Santa Clara	
City of Santa Clara 2010–2035 General Plan (2010)	The City of Santa Clara 2010–2035 General Plan was adopted on November 16, 2010. The following goals and policies from Chapter 5.9, Public Facilities and Services, are relevant to the project extent: ▪ 5.9.1-G1: Ample facilities for physical activities that promote community health. ▪ 5.9.1-G4: Park, trail, and open space facilities that are accessible and provide connections to destination points and activity centers within the City. ▪ 5.9.1-P4: Provide connections between private and public open space through publicly accessible trails and pathways and by orienting open spaces to public streets. ▪ 5.9.1-P12: Promote the preservation of open space and recreational areas on existing and closed school sites. ▪ 5.9.1-P20: Promote the continuation of a parks per population ratio of 2.4 per 1,000 residents and explore the potential to increase the ratio to 3.0, based on the Parks and Recreation Needs Assessment (Parks Master Plan), referenced in Plan Prerequisite 5.1.1-P24.
City of San Jose	
Envision: San José 2040 General Plan (2011)	The City of San Jose Envision: San José 2040 General Plan was adopted on November 1, 2011. The following goals and policies from Part 4, Parks, Open Space, and Recreation are relevant to the project extent: ▪ PR-1.1: Provide 3.5 acres per 1,000 population of neighborhood/community serving parkland through a combination of 1.5 acres of public park and 2.0 acres of recreational school grounds open to the public per 1,000 San José residents. ▪ PR-1.2: Provide 7.5 acres per 1,000 population of citywide/regional park and open space lands through a combination of facilities provided by the City of San José and other public land agencies. ▪ Goal PR-3: Create a balanced park system that provides all residents access to parks, trails, open space, community centers, dog parks, skate parks, aquatics facilities, sports fields, community gardens, and other amenities. ▪ PR-3.1: Provide equitable access to parks, trails, open space, community centers, dog parks, skate parks, aquatics facilities, sports fields, community gardens, and other amenities to the greatest extent feasible in order to provide a high quality of life for our residents. ▪ Goal PR-5: Develop and promote a series of grand parks to act as focal points for the City, its residents, and its visitors. ▪ PR-5.1: Develop the Guadalupe River Park & Gardens as one of the City's grand parks, and as part of an integrated park system. . .

Policy Document	Summary
	▪ PR-5.5: Connect the Guadalupe River Park & Gardens to other assets in the City via a network of trails and bike paths to encourage connectivity and community and to maximize the park's use and accessibility.
Diridon Station Area Plan Final Plan Report (2014)	The Diridon Station Area Plan was adopted June 2014. The following goal and constraints and assumptions is relevant to the project extent: ▪ Open Space. Enhance and expand recreational opportunities in the Station area, and establish an open space system integrated with Los Gatos Creek and Guadalupe River Park. ▪ Completion of the Los Gatos Creek Master Plan: Making the final connection between the northern and southern sections of the creekside park and trails by completing the section between Santa Clara Street and Park Avenue is a high priority for the City and the community. The DSAP – Final Plan Report show this final piece in place as part of the approach to distribution and connection of public open spaces. ▪ New community park at existing Fire Department training yard: The existing facility, bounded by Park Avenue, South Montgomery Street, West San Carlos Street and the railroad tracks has been identified by The City as an opportunity site for a new public park if the fire training station chooses to relocate elsewhere within San Jose. This area is shown as a large new public park with the Los Gatos creek running through it in the DSAP – Final Plan Report.
San Jose Municipal Code, Title 13, Chapter 13.44, Parks (2017)	The Municipal Code consists of local laws and ordinances on parks enacted and enforced by the local municipality. However, these local laws and ordinances predominantly pertain to rules and regulations for daily use of parks, recreation, and open space. As a result, no local laws and ordinances are applicable to the project extent.
City of Morgan Hill	
City of Morgan Hill 2035 General Plan (2016)	The City of Morgan Hill 2035 General Plan was adopted on July 27, 2016. The following goals and policies from Community Development, Open Space and Conservation are relevant to the project extent: City and Neighborhood Form ▪ Goal CNF-5: Efficient development of County land within the UGB consistent with the City's long-term development strategy. ▪ Goal CNF-7: Preservation of viable agricultural lands and publicly-accessible open space uses on unincorporated lands outside the UGB. Healthy Community ▪ Goal HC-3: Usable, complete, well-maintained, safe, and high-quality activities and amenities, including active and passive parks and recreational facilities, community gardens, and trails that are accessible to all ages, functional abilities, and socio-economic groups. Natural Resources and Environment ▪ Goal NRE-1: Preservation of open space areas and natural features. ▪ Goal NRE-5: Preservation and reclamation of streams and riparian areas as open space.
Morgan Hill Municipal Code, Chapter 12.20, City Parks and Recreation Buildings (2016)	The Municipal Code consists of local laws and ordinances on parks enacted and enforced by the local municipality. However, these local laws and ordinances predominantly pertain to rules and regulations for daily use of parks, recreation, and open space. As a result, no local laws and ordinances are applicable to the project extent.

Policy Document	Summary
City of Gilroy	
Gilroy 2020 General Plan (2002)	The City of Gilroy 2020 General Plan was adopted on June 13, 2002. The following goals and policies from the Public Facilities and Services Chapter are relevant to the project extent: ▪ Goal: A comprehensive and coordinated system of convenient, efficient, and high quality park and recreation facilities and programs to meet the current and future needs of Gilroy residents, integrating important natural features and contributing to the City's identity and livability ▪ Policy 16.01: Maintain the City's established standard of 5 acres of developed park land per thousand population. a) This standard includes mini-parks, neighborhood/school parks, community and community/school parks, sports parks, trails/linear parkways, and special use facilities. b) Park preserves and limited active recreation use areas are valued at 5 percent of their total acreage toward meeting this standard. c) Golf courses non-accessible open spaces, and private recreational facilities are not included in this standard. School lands are not included unless there is a long-term lease agreement for their use as City recreational facilities. ▪ Policy 16.09: Ensure that all facilities and parks comply with State and Federal accessibility codes and standards, such as those established by the Americans with Disabilities Act (ADA), and California Building Standards Code (Title 24, California Code of Regulations) ▪ Policy 16.14: In addition to updates and completion of existing parks and facilities, initiate the following new facilities by the year 2020: – Aquatics facility – Indoor recreation and sports facility – Performing and visual arts facility – Expanded trails system – New community and neighborhood parks in areas not currently served by parks – Downtown park, plaza, or town square that is integral to the functions of Downtown – Expansion of Uvas Creek Park Preserve, extending from Burchell Road in the Hecker Pass area downstream to Highway 101 and Gavilan College, via the Gilroy Sports Park Some of these facilities may be developed in partnership with other agencies and organizations.
Gilroy City Code, Chapter 18, Public Parks (2016)	The Municipal Code consists of local laws and ordinances on parks enacted and enforced by the local municipality. However, these local laws and ordinances predominantly pertain to rules and regulations for daily use of parks, recreation, and open space. As a result, no local laws and ordinances are applicable to the project extent.

Policy Document	Summary
San Benito County	
San Benito County 2035 General Plan (2015)	The San Benito County 2035 General Plan was adopted on July 21, 2015. The following goals and policies from the Natural and Cultural Resources Element are relevant to the project extent: ▪ Goal NCR-1: To preserve and enhance valuable open space lands that provide wildlife habitat and conserve natural, historical, archaeological, paleontological, tribal, and visual resources of San Benito County. Goal NCR-3: To develop and maintain a comprehensive system of parklands and protected public recreational areas that meet both the active and passive recreation needs of all age groups.
San Benito County Code of Ordinances, Title 19, Chapter 19.23, Parks (2016)	The Municipal Code consists of local laws and ordinances on parks enacted and enforced by the local municipality. However, these local laws and ordinances predominantly pertain to rules and regulations for daily use of parks, recreation, and open space. As a result, no local laws and ordinances are applicable to the project extent.
Merced County	
2030 Merced County General Plan (2013)	The Merced County General Plan was adopted on December 10, 2013. The following policies from the Natural Resources Element and the Recreation and Cultural Resources Element are relevant to the project extent: Natural Resources Element ▪ Policy NR-1.2: Identify and support methods to increase the acreage of protected natural lands and special habitats, including but not limited to, wetlands, grasslands, vernal pools, and wildlife movement and migration corridors, potentially through the use of conservation easements Recreation and Cultural Resources Element ▪ Goal RCR-1: Preserve, enhance, expand, and manage Merced County's diverse system of regional parks, trails, recreation areas, and natural resources for the enjoyment of present and future residents and park visitors. ▪ Policy RCR-1.1: Encourage the continuation and expansion of existing public recreation land uses, including, but not limited to, public beaches, parks, recreation areas, wild areas, and trails. ▪ Policy RCR-1.3: Encourage a minimum of three acres of neighborhood, community, or regional parkland per each 1,000 persons in the County by: a) Working with other agencies and private interests to provide for adequate neighborhood, community, and regional parkland and facilities; b) Actively participating in the planning of projects that have regional recreation benefits; c) Encouraging and supporting local agency efforts to achieve their objectives for providing local parkland. All local providers should seek to provide at least three acres of parkland for each 1,000 persons. d) Actively seeking available regional, State, and Federal grant funds for acquiring, developing, and maintaining regional parks; and e) Encouraging and supporting other public agencies and private groups in the development of recreation facilities that are consistent with the 2030 Merced County General Plan. ▪ Policy RCR-1.6: Require buffering between non-recreational land uses and sensitive public recreation lands through site design and other techniques when the non-recreational land use may significantly impact recreational lands.

Policy Document	Summary
	▪ Policy RCR-1.11: Encourage the use of regional parks and open-space areas as a mechanism to preserve the county's natural scenic beauty and protect land for public purposes.

Urban Growth Boundary - UGB

Aesthetics and Visual Quality

Table 16 Regional and Local Plans and Policies Relevant to Aesthetics and Visual Quality

Plan and Policies	Summary
Santa Clara County	
Santa Clara County General Plan (1994)	Growth and Development ▪ C-GD 17: Provide protection of a scenic corridor in Coyote Valley adjacent to US 101. Transportation ▪ C-TR(i) 29: Build attractive transit facilities, including passenger waiting shelters and major transfer facilities. Parks and Recreation ▪ C-PR 4: Public lands should preserve visually significant open space. ▪ C-PR 34: Designate and protect eligible roadways as local or state scenic highways. ▪ C-PR 35: Designate a system of scenic roads linking the urban area with the rural and open space areas. ▪ C-PR(i) 20: Designate all Santa Clara County roads shown in the "California Master Plan of Scenic Highways Eligible for Official Scenic Highway Designation" as scenic highways. ▪ C-PR(i) 21: Add the following highways (US 101 south of SR 85, SR 152 west of Gilroy, SR 17 south of I-280, I-680 and I-280 south of I-880) to the State Master Plan for Scenic Highways and designate them as official state scenic highways. ▪ C-PR(i) 22: Designate as scenic highways roads warranting scenic highway status in the County's General Plan. ▪ C-PR(i) 23: Seek city scenic highway designations for those freeways and expressways designated in the County's General Plan as scenic highways. ▪ C-PR 37: The natural scenery along many of Santa Clara County's highways should be protected from land uses and other activities which would diminish its aesthetic beauty. ▪ C-PR 38: Land use should be controlled along scenic roads so as to relate to the location and functions of these roads and should be subject to design review and conditions to assure the scenic quality of the corridor. ▪ C-PR 39: Protect the visual integrity of the scenic gateways to the South County (Pacheco Pass, Hecker Pass, Route 101 south of Gilroy, and a Coyote greenbelt area north of Morgan Hill). ▪ C-PR 43: Locate new structures where they will not have a negative impact on the scenic quality of the area. In rural areas they should generally be set back at least 100 feet from scenic roads and highways to minimize their visual impact.

Plan and Policies	Summary
	▪ C-PR 45: Screen from view activities along scenic highways that are of a substantially unsightly nature, such as equipment storage or maintenance, fuel tanks, refuse storage or processing and service yards. Resource Conservation ▪ C-RC 1: Natural and heritage resources shall be protected and conserved for their ecological, functional, economic, aesthetic, and recreational values. ▪ C-RC 27: Habitat types and biodiversity within Santa Clara County and the region should be maintained and enhanced for their ecological, functional, aesthetic, and recreational importance. ▪ C-RC 57: The scenic and aesthetic qualities of both the natural and built environments should be preserved and enhanced for their importance to the overall quality of life for Santa Clara County. ▪ C-RC 58: The general approach to scenic resource preservation on a countywide basis should include: conserving scenic natural resources through long range, inter-jurisdictional growth management and open space planning; minimizing development impacts on highly significant scenic resources; and maintaining and enhancing scenic urban settings, such as parks and open space, civic places, and major public common areas. ▪ C-RC 60: Hillsides, ridgelines, scenic transportation corridors, major county entryways, and other areas designated as being of special scenic significance should receive additional consideration and protections due to their prominence, visibility, or symbolic value. ▪ C-RC 61: Public and private development and infrastructure located in areas of special scenic significance should not create major, lasting adverse visual impacts. ▪ C-RC 62: Urban parks and open spaces, civic places, and public commons areas should be designed, developed and maintained such that the aesthetic qualities of urban settings are preserved and urban livability is enhanced. Natural resource features and functions within the urban environmental should also be enhanced. Health and Safety ▪ C-HS(i) 28: Incorporate acoustic site planning into the design of new development through measures such as: separation of noise sensitive buildings from noise generating sources; use of topography and intervening structures to shield noise sensitive land uses; and adequate sound proofing within receiving structures. Rural Growth and Development ▪ R-GD 3: Land uses and development permitted under County jurisdiction shall be consistent with the following major County policies: a. conservation of natural resources; b. avoidance of natural hazards and the prevention of pollution which could pose a threat to public health, safety, and welfare; c. minimizing demand for public services and costs to the general public of providing and maintaining services; d. preservation of rural character, rural lifestyle opportunities, and scenic resources; e. preservation of agriculture; and f. preventing unwanted or premature development that would preclude efficient conversion to urban uses and densities in areas suitable and intended for future annexation. ▪ R-GD 9: Special area plans should be developed and employed for rural unincorporated areas that require or would benefit from more detailed planning, policies, and implementation measures, such as: a. areas subject to critical development constraints, deficiencies, or other special circumstances which render individual development proposals difficult or infeasible to process and

Plan and Policies	Summary
	approve; b. joint planning for areas of mutual interest or concern to multiple jurisdictions, such as joint hillside development plans or interurban/ greenbelt areas; c. designated areas of "critical environmental concern" as described under CEQA law, or areas likely to be adversely affected by cumulative development impacts; d. areas formally designated as historic or agricultural preserves; and e. areas designated for natural resource conservation, such as significant natural habitat areas, water supply watersheds, or scenic preservation areas. ▪ R-GD 20: Grading and terrain alteration should conserve the natural landscape and resources, minimize erosion impacts, protect scenic resources, habitat, and water resources. ▪ R-GD 25: Grading associated with roads, bridges, retaining walls, or similar improvements related to access requirements should not create a significant visual scar or impact to the environment. They should generally follow natural terrain and contours to the maximum extent feasible. ▪ R-GD 27: Grading and excavation to situate a structure within a hillside to reduce visual impacts is encouraged. Rural Transportation ▪ Strategy #5: Preserve and Enhance Scenic Qualities adjacent to Scenic Rural Roads. Rural Parks and Recreation ▪ Strategy #2: Protect scenic highway corridors. ▪ R-PR 36: Local and state roads and highways traversing Santa Clara County's scenic rural and urban areas should be designated and protected as local or state scenic highways. ▪ R-PR(i) 21: Designate as official scenic highways all Santa Clara County roads shown in the "California Master Plan of Scenic Highways Eligible for Official Scenic Highway Designation. "R-PR(i) 22: Add the following highways to the State Master Plan for Scenic Highways and designate them as official state scenic highways: US 101 (South Valley Freeway); SR 152 (Hecker Pass Highway); SR 17 (Los Gatos to Campbell); I-680; I-280 (between 17/880 and US 101). ▪ R-PR(i) 23: Designate as scenic highways in the County's General Plan those roads warranting scenic highway status. ▪ R-PR(i) 24: Seek city scenic highway designations for those freeways and expressways designated in the County's General Plan as scenic highways. ▪ R-PR 41: Protect the visual integrity of the scenic gateways to the South County—Pacheco Pass, Hecker Pass, Route 101 south of Gilroy, and a Coyote greenbelt area north of Morgan Hill. ▪ R-PR 45: New structures should be located where they will not have a negative impact on the scenic quality of the area. In rural areas they should generally be set back at least 100 feet from scenic roads to minimize their visual impact. ▪ R-PR 47: Activities along scenic highways that are of a substantially unsightly nature, such as equipment storage or maintenance, fuel tanks, refuse storage or processing and service yards, should be screened from view. Rural Resource Conservation ▪ R-RC 39: Screening of obtrusive or unsightly aspects of a project should be considered as a means of preserving the scenic value of riparian areas.

Plan and Policies	Summary
	▪ R-RC 86: Projects in areas found to have heritage resources shall be conditioned and designed to avoid loss or degradation of the resources. If conflict is unavoidable, mitigation measures may be imposed. ▪ R-RC 95: The scenic and aesthetic qualities of both the natural and built environments should be preserved and enhanced for their importance to the overall quality of life. ▪ R-RC 96: The general approach to scenic resource preservation for the rural unincorporated areas consists of minimizing scenic impacts in rural areas through control of development densities and limiting development impacts on highly significant scenic resources, such as ridgelines, prominent hillsides, streams, transportation corridors, and county entranceways. ▪ R-RC 98: Hillsides, ridgelines, scenic transportation corridors, major county entryways, stream environments, and other areas designated as being of special scenic significance should receive utmost consideration and protection due to their prominence, visibility, and overall contribution to the quality of life in Santa Clara County. ▪ R-RC 101: Roads, building sites, structures, and public facilities shall not be allowed to create major or lasting visible scars on the landscape. ▪ R-RC(i) 36: Protect the scenic value of the following major County thoroughfares and entranceways through state scenic highway designation, including SR 152 east of Gilroy (Pacheco Pass), SR 152 west of Gilroy (Hecker Pass), and US 101 south of the San Jose city limits. Rural Health and Safety ▪ R-HS(i) 6: Incorporate acoustic site planning into the design of new development. Possible methods include: separating noise sensitive buildings from noise generating sources; using topography and intervening structure to shield noise sensitive land uses; and adequate sound reduction within the receiving structure. Rural Land Use Policies ▪ R-LU 1: “Resource Conservation Areas” refers to following: Baylands; Agriculture; Hillsides; Ranchlands, Agricultural; Open Space Reserve; Regional Parks, Existing; and other Public Open Space Lands. ▪ R-LU 74: Major electric transmission lines should avoid ridgelines and follow the natural flow and rhythm of land forms as much as possible. Routes should not cross scenic roads at points where lines will be visible for long distances. Minimum height structures should be used where the additional structures which result are not objectionable. Design and paint selection should reduce visual impact. Vegetation should be used for screening and need not always be removed in order to provide adequate service access where it will not interfere with a facility’s safe operation. ▪ R-LU 75: Electric substations and gas control and metering stations shall be located, designed, and landscaped to fit as inconspicuously and harmoniously as possible into the area in which they are required. Locations along scenic roads and heavily traveled highways should be avoided. ▪ R-LU 79: New public transportation facilities shall be compatible with the land uses in the areas in which they are located and consistent with the County’s General Plan. ▪ R-LU 113: The San Martin Planning Area boundary encompasses the area between Maple Avenue on the North; Masten Avenue on the South; the East Foothills and West Foothills (excluding those areas annexed to Morgan Hill). It excludes that part of the current study area which lies west of Monterey Road

Plan and Policies	Summary
	and between the hill crest north and paralleling California Avenue and West Middle Avenue. ▪ R-LU 148: The portion of Highway 101 (South Valley Freeway) in San Martin should be considered a scenic highway. South County Joint Area Plan ▪ SC 0.3: The South County Joint Area Plan shall apply to the incorporated and unincorporated areas south of the Morgan Hill–San Jose boundary agreement line. The Joint Area Plan also includes policies relating to the Coyote Valley. ▪ SC 16.6: The visual integrity of the scenic gateways to the South County (Pacheco Pass, Hecker Pass, Route 101 south of Gilroy, and a Coyote greenbelt area north of Morgan Hill) should be protected.
City of Santa Clara	
City of Santa Clara 2010-2035 General Plan (2010)	General Land Use Policies ▪ 5.3.1-P1: Preserve the unique character and identity of neighborhoods through community-initiated neighborhood planning and design elements incorporated in new development. ▪ 5.3.1-P3: Support high quality design consistent with adopted design guidelines and the City's architectural review process. ▪ 5.3.1-P10: Provide opportunities for increased landscaping and trees in the community, including requirements for new development to provide street trees and a minimum 2:1 on- or off site replacement for trees removed as part of the proposal to help increase the urban forest and minimize the heat island effect. ▪ 5.3.1-P24: Coordinate sign programs for commercial uses to promote continuity, improve streetscape design, and reduce visual clutter. ▪ 5.3.1-P27: Encourage screening of above-ground utility equipment to minimize visual impacts. ▪ 5.3.1-P28: Encourage undergrounding of new utility lines and utility equipment throughout the City. El Camino Real Focus Area Goals and Policies ▪ 5.4.1-P14: Encourage public art, special signage, banners, and landscaping throughout the Focus Area, including features that would connect the corridor with Downtown. Santa Clara Station Focus Area Goals and Policies ▪ 5.4.3-P9: Encourage streetscape design with street trees, wider sidewalks, pedestrian-oriented lighting, curb bulb-outs and special paving and striping within the Focus Area to emphasize accessibility. ▪ Historic Preservation Goals and Policies ▪ 5.6.1-G1: Preservation of historic resources and neighborhoods. ▪ 5.6.1-P3: Protect historic resources from demolition, inappropriate alterations, and incompatible development. Rail and Freight Goals and Policies ▪ 5.8.7-G2: Neighborhoods protected from negative effects associated with rail and freight services. Conservation Goals and Policies ▪ 5.10.1-G2: Conservation and restoration of riparian vegetation and habitat. ▪ 5.10.1-P4: Protect all healthy cedars, redwoods, oaks, olives, bay laurel, and pepper trees of any size, and all other trees over 36 inches in circumference

Plan and Policies	Summary
	measured from 48 inches above-grade on private and public property as well as in the public right-of-way. ▪ 5.10.1-P5: Encourage enhancement of land adjacent to creeks in order to foster the reinstatement of natural riparian corridors where possible. ▪ 5.10.1-P12: Encourage property owners and landscapers to use native plants and wildlife-compatible non-native plants when feasible. ▪ 5.10.4-P7: Require installation of native and low-water-consumption plant species when landscaping new development and public spaces to reduce water usage. ▪ 5.10.4-P8: Require all new development within a reasonable distance of existing or proposed recycled water distribution systems to connect to the system for landscape irrigation.
City of San Jose	
Envision: San José 2040 General Plan (2011)	Arts and Culture ▪ AC-2.1: High Impact Public Art. Site public art in key locations. Prioritize innovative public art in three regional destination areas: Downtown, North San José, and the Mineta San José International Airport. Place public art at transportation hubs: pedestrian, bike, and transit improvements in pedestrian priority areas; encourage the inclusion of public art at VTA and BART stations, including Diridon Station; and integrate a broad range of art projects into the trail network to connect neighborhoods and bring people closer to nature. Integrate public art into bond-funded park, library, community facility, and public safety projects. Cultivate community-based art projects that support neighborhood revitalization goals. Fiscal Sustainability ▪ FS-5.10: Maintain the rural and agricultural character of Central Coyote Valley and do not expand the Urban Service Area to include it. Measurable Environmental Sustainability ▪ MS-21.5: As part of the development review process, preserve protected trees (as defined by the Municipal Code), and other significant trees. Avoid any adverse effects on the health and longevity of protected or other significant trees through appropriate design measures and construction practices. Special priority should be given to the preservation of native oaks and native sycamores. When tree preservation is not feasible, include appropriate tree replacement, both in number and spread of canopy. ▪ MS-21.6: As a condition of new development, require the planting and maintenance of both street trees and trees on private property to achieve a level of tree coverage in compliance with and that implements City laws, policies, or guidelines. ▪ MS-21.7: Manage infrastructure to ensure that the placement and maintenance of street trees, streetlights, signs, and other infrastructure assets are integrated. Give priority to tree placement in designing or modifying streets. ▪ MS-21.8: For Capital Improvement Plan or other public development projects, or through the entitlement process for private development projects, require landscaping including the selection and planting of new trees to achieve the following goals: avoid conflicts with nearby power lines; avoid potential conflicts between tree roots and developed areas; avoid use of invasive, non-native trees; remove existing invasive, non-native trees; incorporate native trees into urban plantings in order to provide food and cover for native wildlife species; and

Plan and Policies	Summary
	plant native oak trees and native sycamores on sites which have adequately sized landscape areas and which historically supported these species. ▪ MS-21.9: Where urban development occurs adjacent to natural plant communities (e.g., oak woodland, riparian forest), landscape plantings shall incorporate tree species native to the area and propagated from local sources (generally from within 5–10 miles and preferably from within the same watershed). Environmental Resources ▪ ER-2.2: Ensure that a 100-foot setback from riparian habitat is the standard to be achieved in all but a limited number of instances, only where no significant environmental impacts would occur. ▪ ER-2.3: Design new development to protect adjacent riparian corridors from encroachment of lighting, exotic landscaping, noise, and toxic substances into the riparian zone. ▪ ER-6.3: Employ low-glare lighting in areas developed adjacent to natural areas, including riparian woodlands. Any high-intensity lighting used near natural areas will be placed as close to the ground as possible and directed downward or away from natural areas. ▪ ER-6.4: Site public facilities such as ballparks and fields that require high-intensity night lighting at least 0.5 mile from sensitive habitats to minimize light pollution, unless it can be demonstrated that lighting systems will not substantially increase lighting within natural areas (e.g., due to screening topography or vegetation). Environmental Considerations/Hazards ▪ EC-1.5: Encourage the State Department of Transportation and County transportation agencies to provide visually pleasing sound attenuation devices on all new and existing freeways and expressways. Infrastructure ▪ IN-1.9: Design new public and private utility facilities to be safe, aesthetically pleasing, compatible with adjacent uses, and consistent with the Envision General Plan goals and policies for fiscal sustainability, environmental leadership, an innovative economy, and quality neighborhoods. ▪ IN-1.10: Require undergrounding of all new publicly owned utility lines. Encourage undergrounding of all privately owned utility lines in new developments. Work with electricity and telecommunications providers to underground existing overhead lines. ▪ IN-1.11: Locate and design utilities to avoid or minimize impacts to environmentally sensitive areas and habitats. Vibrant Neighborhoods ▪ VN-1.9: Cluster parking, make use of shared parking facilities, and minimize the visual impact of surface parking lots to the degree possible to promote pedestrian and bicycle activity and to improve the City's aesthetic environment. Community Design ▪ CD-1.13: Use design review to encourage creative, high-quality, innovative, and distinctive architecture that helps to create unique, vibrant places that are both desirable urban places to live, work, and play and that lead to competitive advantages over other regions. ▪ CD-1.14: Use the Urban Village Planning process to establish standards for their architecture, height, and massing.

Plan and Policies	Summary
	▪ CD-1.17: Minimize the footprint and visibility of parking areas. Where parking areas are necessary, provide aesthetically pleasing and visually interesting parking garages with clearly identified pedestrian entrances and walkways. Encourage designs that encapsulate parking facilities behind active building space or screen parked vehicles from view from the public realm. Ensure that garage lighting does not impact adjacent uses, and to the extent feasible, avoid impacts of headlights on adjacent land uses. ▪ CD-1.19: Encourage the location of new and relocation of existing utility structures into underground vaults or within structures to minimize their visibility and reduce their potential to detract from pedestrian activity. When above-ground or outside placement is necessary, screen utilities with art or landscaping. ▪ CD-1.23: Further the Community Forest Goals and Policies in this Plan by requiring new development to plant and maintain trees at appropriate locations on private property and along public street frontages. Use trees to help soften the appearance of the built environment, help provide transitions between land uses, and shade pedestrian and bicycle areas. ▪ CD-1.24: Within new development projects, include preservation of ordinance-sized and other significant trees, particularly natives. Avoid any adverse effect on the health and longevity of such trees through design measures, construction, and best maintenance practices. When tree preservation is not feasible, include replacements or alternative mitigation measures in the project to maintain and enhance our Community Forest. ▪ CD-1.26: Apply the Historic Preservation Goals and Policies of this Plan to proposals that modify historic resources or include development near historic resources. ▪ CD-4.6: Support cohesive and architecturally distinctive urban development along Grand Boulevards, and include such design elements as enhanced landscaping; attractive lighting; wide, comfortable sidewalks; area identification banners; and harmonious building scale features. ▪ CD-4.11: Accomplish sound attenuation for development along City streets through the use of setbacks and building design rather than sound attenuation walls. When sound attenuation walls are located adjacent to expressways, freeways, or railroad lines, landscaping, public art, or an aesthetically pleasing and visually interesting design should be used to minimize visual impacts. ▪ CD-5.5: Include design elements during the development review process that address security, aesthetics, and safety. Safety issues include, but are not limited to, minimum clearances around buildings, fire protection measures such as peak load water requirements, construction techniques, and minimum standards for vehicular and pedestrian facilities and other standards set forth in local, state, and federal regulations. ▪ CD-5.6: Design lighting locations and levels to enhance the public realm, promote safety and comfort, and create engaging public spaces. Seek to balance minimum energy use of outdoor lighting with goal of providing safe and pleasing well-lit spaces. Consider the City's outdoor lighting policies in development review processes. ▪ CD-6.5: Promote iconic architecture and encourage and incorporate innovative, varied, and dynamic design features (e.g., appearance, function, sustainability aspects) into sites, buildings, art, streetscapes, landscapes, and signage to make Downtown visually exciting and to attract residents and visitors. ▪ CD-6.8: Recognize Downtown as the hub of the County's transportation system and design buildings and public spaces to connect and maximize use of all

Plan and Policies	Summary
	types of transit. Design Downtown pedestrian and transit facilities to the highest quality standards to enhance the aesthetic environment and to promote walking, bicycling, and transit use. Design buildings to enhance the pedestrian environment by creating visual interest, fostering active uses, and avoiding prominence of vehicular parking at the street level. ▪ CD-6.12: Promote creative and experimental urban forms, activities and land uses that further the economic, fiscal, environmental, and social goals of this plan and reflect San José's culture of innovation. ▪ CD-9.1: Ensure that development within the designated Rural Scenic Corridors is designed to preserve and enhance attractive natural and built vistas. ▪ CD-9.3: Ensure that development along designated Rural Scenic Corridors preserves significant views of the Valley and mountains, especially in, or adjacent to, Coyote Valley, the Diablo Range, the Silver Creek Hills, the Santa Teresa Ridge, and the Santa Cruz Mountains. ▪ CD-10.1: Recognize the importance of Gateways in shaping perceptions of San José. ▪ CD-10.3: Require that development visible from freeways (including U.S.101, I-880, I-680, I-280, SR17, SR85, SR237, and SR87) be designed to preserve and enhance attractive natural and built vistas. ▪ CD-10.6: Develop Gateway plans for Gateway locations identified in the Envision General Plan. Plans should include overall streetscape and private design guidelines, needed capital improvements, and long-term solutions for their maintenance. Land Use Policies ▪ LU-14.3: Design new development, alterations, and rehabilitation/remodels in Conservation Areas to be compatible with the character of the Conservation Area. In particular, projects should respect character-defining elements of the area that give the area its identity. These defining characteristics could vary from area to area and could include density, scale, architectural consistency, architectural variety, landscape, etc. ▪ LU-14.7: Ensure City public works projects (street lights, street tree planting, sidewalk design, etc.) promote, preserve, or enhance the historic character of Conservation Areas. ▪ LU-14.8: Perform modifications to the exterior of any building or structure located in a Conservation Area in a manner consistent with any and all design guidelines approved or accepted by the City Council for the preservation of historic buildings or structures. Transportation Policies ▪ TR-4.3: Support the development of amenities and land use and development types and intensities that contribute to increased ridership on the potential high-speed rail system, and also provide positive benefits to the community. ▪ TR-4.4: Work cooperatively with the California High-Speed Rail Authority to ensure that rail corridors within the city are planned and constructed in a manner that enhances the character of the surrounding neighborhoods. ▪ TR-4.5: As appropriate, regularly coordinate with rail operators in San José on the following matters: maintenance of rail lines, landscaping, and easements; vehicle and pedestrian safety near at-grade rail crossings; electrification to increase the frequency of train service and reduce environmental impacts; separations (either above-ground or underground) to improve street connectivity and pedestrian and bicycle mobility at ground level; establishment of timed transfers with other transit providers in the area; and analysis and mitigation of

Plan and Policies	Summary
	the potential negative impacts resulting from increased train service, corridor expansion, and the eventual upgrading of a rail line. Implementation ▪ IP-16.1: Other public agencies and utility companies should consider the Envision General Plan goals and policies and Land Use/Transportation Diagram in planning the delivery of services to San José residents and businesses. ▪ IP-16.2: Where determination of consistency, compatibility, or conformance of any proposal with the Envision General Plan depends on an exercise of discretion, such discretion is solely within the purview of the City of San José. Any agency proposing to apply the provisions of the Envision General Plan to a proposal can seek a determination of such consistency, compatibility, or conformance by filing a written request with the Director of Planning of the City of San José.
Diridon Station Area Plan (2014)	▪ None
City of San Jose Tamien Station Area Specific Plan (1995)	▪ None
City of San Jose Communications Hill Plan (1992)	▪ None
City of San Jose Coyote Valley Plan (2008)	Fixed Environmental Elements ▪ 11: The alignment and improvements of Monterey Road necessitated by CVP shall maintain a landscape buffer between the road and the railroad of at least – feet and incorporate existing Keesling's Shade Trees. The landscaped buffer shall be installed in conjunction with adjacent Monterey Road improvements and shall include an analysis of the health of the existing trees, remedial maintenance of existing trees, and replacement of dead or dying trees with trees of the same species. Community Facilities and Services ▪ 125: Provide a continuous sidewalk on the east side of Monterey Road that is separated by a landscape strip from the roadway. ▪ 126: Preserve the westerly curb line of Monterey Road to protect the Keesling's Shade Trees. Add massing of shrubs within the area between the curb line and the railroad right-of-way, which screens views to the railroad. ▪ 127: Provide a 20-foot minimum buffer planted with redwood trees on the west side of the railroad right of way. ▪ 128: Encourage a landscape buffer, sound walls and shrubs on the west side of the railroad right-of-way. Within this 20-foot buffer zone, shrubs should be planted on both sides of the wall, and vines that attach without support should be planted on the west side of the wall. ▪ 129: A continuous planted "orchard" style grid of trees should be used to recall the agricultural history of Coyote Valley and create an attractive edge on the eastern side of Monterey Road, between the road and the development. Species include orchard varieties such as cherries, apricot, peach, and plums. ▪ 130: Plant the median of Monterey Road with large-scale canopy trees, with one species used for the entire length of the road through Coyote Valley.

Plan and Policies	Summary
Coyote Creek Parkway County Park Master Plan (2006)	Guideline, Goals, and Objectives ▪ PR-5: Maintain opportunities for the Parkway user to experience a sense of remoteness within the context of a rural riparian habitat corridor.
City of Morgan Hill	
Morgan Hill 2035 General Plan (2016)	City and Neighborhood Form ▪ Policy CNF-8.1: High Quality Design. Require all development to feature high quality design that enhances the visual character of Morgan Hill. ▪ Policy CNF-8.10: Public Landscaping. Landscape medians and public areas along major streets using drought- tolerant plant materials, and encourage CALTRANS to use drought-tolerant plants along Highway 101. ▪ Policy CNF-8.14: Sound Walls. Minimize the use of sound walls to situations where they are required to meet noise standards and other forms of mitigation are not available. Use techniques less visually disturbing than sound walls, including but not limited to earth berms and intervening placement of non-sensitive buildings when requiring noise impact mitigation of new and/or expanded development. ▪ Policy CNF-8.20: Nighttime Lighting. Require nighttime lighting to be designed to minimize light spillage to adjacent properties.* ▪ Policy CNF-19.2: Visual Integrity of Gateways. Enhance the visual integrity of the gateways to the City such as the Madrone area north of Cochrane Road, the Cochrane Road/Monterey Road intersection, Monterey Road south of Watsonville Road, the Cochrane, Dunne, and Tennant freeway interchanges, and the Caltrain station. Transportation ▪ Policy TR-3.18: Grade-Separated Railroad Crossings. Plan for the construction of grade-separated crossings of the Union Pacific railroad to improve emergency vehicle response times and minimize conflicts between railroad trains and on-road vehicles. California Public Utilities Commission approval is required to modify an existing highway rail crossing or to construct a new crossing. Grade-separated crossings should be encouraged at Dunne Avenue (Depot Street to be re-routed through the existing Community and Cultural Center parking lot to create an intersection with Church Street either prior to or in conjunction with the grade separation project). ▪ Policy TR-3.20: Arterial Design and Landscaping. Require development adjacent to arterial streets to minimize the use of fences and walls wherever possible. Strive to accommodate all modes of travel on arterial streets, and improve the Butterfield Corridor, Monterey Road Corridor, and Hale/Santa Teresa Corridor to the extent feasible as well-landscaped multi-modal boulevards. Continue to implement the program for planting street trees and landscaping arterial streets and major intersections. ▪ Natural Resources and Environment ▪ Policy NRE-2.1: Hillside and Ridgeline Views. Protect views of hillsides, ridgelines, and prominent natural features surrounding the City. These features help define the City's historic rural character, sense of place, image and identity. ▪ Policy NRE-6.4: Tree Preservation and Protection. Preserve and protect mature, healthy trees whenever feasible, particularly native trees, historically significant trees, and other trees which are of significant size or of significant aesthetic value to the immediate vicinity or to the community as a whole. ▪ Safety, Services, and Infrastructure

Plan and Policies	Summary
	▪ Policy SSI-9.7: Sound Barrier Design. Require non-earthen sound barriers to be landscaped, vegetated, or otherwise designed and/or obscured to improve aesthetics and discourage graffiti and other vandalism.
City of Gilroy	
City of Gilroy 2002-2020 General Plan (2002)	Community Design and Development ▪ 1.09: Gateways. Create entry points to the City that are identified by well-designed, landscaped entrances with landscaped medians, indicating civic pride and a concern for civic beauty. Principal gateways to Gilroy are located on north and south Monterey Street; Highway 152/Hecker Pass; Highway 152/Pacheco Pass; north and south Santa Teresa Boulevard; and at the Highway 101 interchanges at Masten, Buena Vista, Leavesley, and Tenth Street. ▪ 6.01: Scenic Highways. Support the designation of Hecker Pass Highway, Santa Teresa Boulevard, and Pacheco Pass Highway as official State Scenic Highways, and establish appropriate development controls to ensure long-term protection of their scenic qualities. Controls should establish appropriate setbacks, sign controls, and other development regulations in keeping with State guidelines for the protection of scenic highway corridors. ▪ 6.03: Highway 101 Landscaping and View Protection. Work with CALTRANS and the County to provide additional landscaping along the Highway 101 right-of-way to enhance its attractiveness, recognizing that it is the primary "visitor-serving" traffic artery in the Planning Area. Also, encourage new developments facing Highway 101 to provide landscape screening and to protect and enhance existing views of farmland and surrounding hills. Community Resources and Potential Hazards ▪ 26.03: Buffering Standards. Enforce stringent buffering standards to protect residents from freeway, expressway, highway, and industrial noise. Use open land as a buffer between residential areas and highways or industrial areas wherever possible. ▪ 26.04: Acoustical Design. Consider the acoustical design of projects in the development review process to reduce noise to an acceptable level. Ensure that noise mitigation features are designed and implemented in an aesthetically pleasing and consistent manner. ▪ 26.05: Earth Berms. Require landscaped earth berms as an alternative to noise barriers where feasible to buffer noise along major thoroughfares adjacent to residential areas. Where an earth berm is not feasible, a masonry wall screened with drought tolerant, low maintenance landscaping should be required.
Downtown Specific Plan (2005)	Vision ▪ Continue to embrace the historic and eclectic design pattern of Downtown Gilroy by not requiring new development to adhere to a particular design theme. ▪ Protect the character, scale and design of adjacent single-family residential development beyond Eigleberry Street and Railroad Street. ▪ Encourage enhanced landscaping, including mature street trees, shrubs, and groundcover that provide interest, color, style and flowering characteristics in Downtown Gilroy. ▪ Provide a stronger and more cohesive sense of identity to the Downtown by adhering to a common design for public infrastructure such as signs, lighting and other elements. ▪ Parking should be located behind structures in all districts.

Plan and Policies	Summary
	▪ Planting should be used to screen or separate less desirable areas from public view, such as trash enclosures, parking areas, storage areas, loading areas, and public utilities. ▪ Existing historic or older structures with architectural details or ornamentation should be retained, restored, or replicated whenever possible. Land Use ▪ Properties between Lewis Street and Seventh Street on the west side of the railroad corridor must provide a setback to accommodate on-site parking, access drive, and a landscaped buffer. Articulation should be provided on building facades to promote a pleasing view of Downtown. ▪ A "standard" fencing design and a five-foot minimum landscape planter area adjacent to the railroad corridor. ▪ A pedestrian pathway along the east side of the railroad corridor between Tenth Street and Leavesley Road. ▪ Streetscape Beautification and Public Improvements ▪ The former industrial/railroad area will transform into a contemporary urban streetscape. ▪ Sidewalks will be widened and street trees added. Streetscape and lighting improvements will complement the urbanized environment. Railroad Corridor ▪ This corridor will be beautified to the greatest extent possible. Fencing will provide security as well as aesthetic enhancement. Landscaping, including trees and other plants, will improve the look of the corridor and help screen undesirable views to adjoining properties. ▪ Improved pedestrian crossings at Tenth Street, Old Gilroy Street, Sixth Street, Martin Street, and Lewis Street will also enhance the area. Parking Structures ▪ All proposed parking structures in the Downtown will be public parking structures and should adhere to specific standards in order to minimize the structure's impact upon the streetscape. ▪ All public parking structures should adhere to the following guidelines: Design openings to look like window openings; substantial massing should occur at the corner of the structures to anchor the building; height should be added to the parapet at key areas on the building structure to accent entries and reduce the long horizontal façade that is typical of parking structures; consider adding awnings or trellis structures at vehicular and pedestrian entrances to create a pedestrian scale; horizontal openings should be broken up with vertical columns to create a rhythm of openings; retail spaces should front the pedestrian spaces at the ground floor-where retail is not provided on the ground floor, the structure should be located so that the structure does not directly abut paved areas, and; consider providing landscaping and vines on façades to help reduce the visual impact of the structure.
Gilroy High-Speed Train Station Visioning Project Vision Report (2012)	▪ None
San Benito County	
San Benito County 2035 General Plan (2015)	Public Facilities and Services Element ▪ PFS-9.4: The County shall require that the siting of telecommunications facilities minimizes their visibility, prevents visual clutter, reduces conflicts with

Plan and Policies	Summary
	surrounding land uses, and avoids views of scenic highways, public parks and recreation facilities, or other scenic view areas. ▪ PFS-9.5: The County shall require that the design of telecommunications facilities (e.g., cabinets, buildings, antennas, security fencing) integrate into existing adjacent conditions and minimize visibility through the use of: appropriate colors, existing buildings and structures, screening, disguising, landscaping, and compatibility with surrounding structures and natural environments. Natural and Cultural Resources Element ▪ NCR-1.3: The County shall continue to protect and preserve the rural landscape and implement open space policies for: public health, safety, and welfare; continued agricultural uses; scenic viewscape preservation, including scenic highway corridors; park and recreation uses; conservation of significant natural resources; the containment and definition of limits to urbanization; and the preservation of the natural habitat for threatened or endangered plant and animal species. ▪ NCR-8.1: The County shall endeavor to protect the visual characteristics of certain transportation corridors that are officially designated as having unique or outstanding scenic qualities. ▪ NCR-8.3: The County shall review all projects involving grading within Scenic Corridors to protect valuable soil resources, preserve the natural environment, and avoid significant adverse impacts within scenic areas. ▪ NCR-8.8: The County shall require all new electric and communication distribution facilities proposed within the Scenic Corridor to be placed underground, whenever feasible. Where overhead utility lines are unavoidable, every effort should be made to reduce the visual impact through elements of design. ▪ NCR-8.11: The County shall ensure that new development and structures, within areas that are not regulated by a Specific Plan, are screened and/or developed in a manner to appear similar to existing agricultural, rural, or low intensity uses in the vicinity. ▪ NCR-9.1: The County shall continue to enforce the development lighting ordinance (SBC Code Chapter 19.13) and restrict outdoor lighting and glare from development projects in order to ensure good lighting practices, minimize nighttime light impacts, and preserve quality views of the night sky. The ordinance shall continue to recognize lighting zones and contain standards to avoid light trespass, particularly from developed uses, to sensitive uses, such as the areas surrounding Fremont Peak State Park and Pinnacles National Park.
Merced County	
2030 Merced County General Plan (2013)	▪ Policy NR-4.1: Promote the preservation of agricultural land, ranch land, and other open space areas as a means of protecting the County's scenic resources. ▪ Policy NR-4.2: Coordinate with CALTRANS, during the review of proposed structures and activities located adjacent to state designated scenic highways, to ensure that scenic vistas and local scenic values are not significantly degraded. ▪ Policy NR-4.4: Consider the surrounding landscape, topography, and existing scenic values when determining the location and construction of new roads. ▪ Policy NR-4.5: Develop and implement a lighting ordinance to require good lighting practices, such as the use of specific light fixtures that reduce light pollution, minimize light impacts, and preserve views of the night sky. The

Plan and Policies	Summary
	ordinance shall contain standards to avoid light trespass, particularly from developed uses, to sensitive wildlife corridors and refuges. ▪ Policy P FS-5.7: Coordinate with local gas and electric utility companies in the design, location, and appropriate expansion of gas and electric systems, while minimizing impacts to agriculture and minimizing noise, electromagnetic, visual, and other impacts on residents.
San Luis Reservoir	
San Luis Reservoir State Recreation Area Resource Management Plan / Preliminary General Plan (2012)	Resource Management ▪ RES-S1: Preserve scenic vistas that overlook open land and water through the identification and definition of significant vista points and viewsheds. Before development of new facilities, consider the visual effect of new structures and carefully site features within an identified viewshed. Where feasible, avoid placement of new structures or other obstructions at or near identified significant vista points and along uninterrupted shorelines and landscapes. ▪ RES-S2: Maintain large expanses of open space free of visual and physical interruptions. Minimize, shield, or use new architectural controls in the development of new structures and reduce existing structures and other features that visually and physically fragment open space. ▪ RES-S3: Make new structures architecturally compatible with their use as recreation facilities and distinguishable from the water operations structures but in keeping with overall site character. Identify the architectural components (style) and other contributing elements that define the recreation use areas and site character, and use this information to assess consistency of new structures. Where feasible, ensure that the mass and scale of new structures are compatible with the setting and do not dominate the surrounding landscape. ▪ RES-S4: Identify a common and unified set of site-related details and materials (signage, gates, surface materials, fences, etc.) so that new facilities and infrastructure are compatible with the character of the site and are distinctive for recreation facilities. Avoid the introduction of materials not in keeping with the local and onsite character. Design new details to be compatible with existing materials and finishes while creating a unified image for the Plan Area recreation facilities. Develop a signage and wayfinding system that incorporates guidelines and standards for signage as well as the location, distribution, and frequency of signs. ▪ RES-S5: Prevent aesthetic and environmental damage from duration and intensity of lighting and fixtures. Design and place light fixtures only as needed and in keeping with use and character. Minimize intensity by considering techniques such as low-voltage fixtures and downlighting. Design lighting systems and facilities that avoid light pollution onsite and offsite spills to neighboring areas.
Santa Nella	
Santa Nella Community Specific Plan (2000)	Circulation ▪ 9: Establish landscape programs for I-5 and the arterial street system within appropriate rights-of-way. Create an urban forest along I-5. Noise ▪ 3: Use a combination of noise barriers of a maximum 6'-8" block wall and/or landscape berms, or larger setbacks as required by noise study, to reduce the noise level in residential exterior yards to 65 dBAs.

Cultural Resources

Table 17 Regional and Local Plans and Policies Relevant to Cultural Resources

Plan and Policies	Summary
Santa Clara County	
Santa Clara County General Plan (1994)	Santa Clara County adopted the *Santa Clara County General Plan* in 1994. The plan includes the following goals, policies, and recommendations related to cultural resources: Vision of the General Plan: Goals for Responsible Resource Conservation ▪ Goal 5. Heritage Resources Protected ▪ Goal 5.1 Protection and preservation of heritage resources both natural (e.g. heritage trees; and paleontological resources) and cultural (e.g. historic sites and structures, and archeological sites). Cultural heritage resources reflecting the contributions to society of all cultures acknowledged, preserved and commemorated. Parks and Recreation Element ▪ Policy C-PR 10: Recreation facilities and activities within regional parks and public open space lands should be located and designed to be compatible with the long term sustainability of each site's natural and cultural resources, with particular attention to the preservation of unique, rare, or endangered resources (including historic and archeological sites, plant and animal species, special geologic formations, etc.). ▪ Policy C-PR 50: Scenic routes which are historic routes into or through the county should be so designated and historic sites and features along them identified and enhanced where appropriate. Resource Conservation Element: General Cultural Heritage Resources Policies ▪ Policy C-RC 49: Cultural heritage resources within Santa Clara County should be preserved, restored wherever possible, and commemorated as appropriate for their scientific, cultural, historic and place values. ▪ Policy C-RC 50: Countywide, the general approach to heritage resource protection should include the following strategies: 1. Inventory and evaluate heritage resources; 2. Prevent or minimize adverse impacts on heritage resources; 3. Restore, enhance, and commemorate resources as appropriate. Strategy #1: Inventory and Evaluate Heritage Resources ▪ Policy C-RC 51: Inventories of heritage resources should be maintained as the basis for local decision making regarding such resources. ▪ Implementation Recommendation C-RC(i)24: Update inventories and evaluations of heritage resources. Survey resources as necessary to augment existing inventories. Strategy #2: Prevent or Minimize Adverse Impacts on Heritage Resources ▪ Policy C-RC 52: Prevention of unnecessary losses to heritage resources should be ensured as much as possible through adequate ordinances, regulations, and standard review procedures. Mitigation efforts, such as relocation of the resource, should be employed where feasible when projects will have significant adverse impact upon heritage resources. ▪ Policy C-RC 53: Cities should balance plans for urban redevelopment with the objectives of heritage resource preservation in such cases where potential conflicting interest may

Plan and Policies	Summary
	arise. Care should be taken to integrate heritage resources with new development wherever possible. ▪ Implementation Recommendation C-RC(i)25: Review administrative procedures and enforcement for effectiveness. ▪ Implementation Recommendation C-RC(i)26: Explore designation of historic districts to preserve character of areas rich in heritage resources. Strategy #3: Restore, Enhance and Commemorate Resources ▪ Policy C-RC 54: Heritage resources should be restored, enhanced, and commemorated as appropriate to the value and significance of the resource. ▪ Policy C-RC 55: Public awareness and appreciation of existing heritage resources and their significance should be enhanced through community organizations, neighborhood associations, the educational system, and governmental programs. ▪ Policy C-RC 56: Heritage resource acquisition, preservation, restoration, and interpretation projects eligible for funding with County Parks Charter Funds are identified in the "Santa Clara County Heritage Resources Inventory" adopted by the Board of Supervisors. ▪ Implementation Recommendation C-RC(i)27: Publicize financial resources from ISTEA and federal income tax credits for restoration of designated resources. ▪ Implementation Recommendation C-RC(i)28: Publish inventories of heritage resources. ▪ Implementation Recommendation C-RC(i)29: Organize community organizations and constituencies for heritage resource preservation. Rural Unincorporated Area Issues and Policies: General Policies ▪ Policy R-RC81: Heritage resources within the rural unincorporated areas of Santa Clara County shall be preserved, restored wherever possible, and commemorated as appropriate for their scientific, cultural, historic and place values. ▪ Policy R-RC82: The following strategies should provide overall direction to efforts to preserve heritage resources: o Inventory and evaluate heritage resources. o Prevent, or minimize, adverse impacts on heritage resources. o Restore, enhance, and commemorate resources as appropriate. Strategy #1: Inventory and Evaluate Heritage Resources ▪ Policy R-RC83: The County's Heritage Resources data base shall be maintained and used to review private development projects and guide the design of public projects. ▪ Policy R-RC84: Heritage resource acquisition, preservation, restoration, and interpretation projects eligible for funding with County Parks Charter Funds are identified in the "Santa Clara County Heritage Resources Inventory" adopted by the Board of Supervisors. ▪ Implementation Recommendation R-RC(i) 32: Update the listings of heritage trees in the Heritage Resources Inventory. Strategy #2: Prevent or Minimize Adverse Impacts on Heritage Resources ▪ Policy R-RC85: No heritage resource shall knowingly be allowed to be destroyed or lost through a discretionary action (zoning, subdivision site approval, grading permit, building permit, etc.) of the County of Santa Clara unless: the site or resource has been reviewed by experts and the County Historic Heritage Commission and has been found to be of insignificant value; or there is an overriding public benefit from the project and compensating mitigation to offset the loss is made part of the project. ▪ Policy R-RC86: Projects in areas found to have heritage resources shall be conditioned and designed to avoid loss or degradation of the resources. Where conflict with the resource is unavoidable, mitigation measures that offset the impact may be imposed.

Plan and Policies	Summary
	▪ Policy R-RC87: Land divisions in areas with heritage resources shall be encouraged to cluster building sites in locations which will minimize the impacts to heritage resources. ▪ Policy R-RC88: For projects receiving environmental assessment, expert opinions and field reconnaissance may be required if needed at the applicant's expense to determine the presence, extent, and condition of suspected heritage resources and the likely impact of the project upon the resources. ▪ Policy R-RC89: Demolition permits proposed for designated heritage resources shall be referred to the Historic Heritage Commission for review and recommendation to the Board of Supervisors. ▪ Policy R-RC90: Heritage and old growth trees, particularly redwoods, should not be cut, except in instances where public safety is jeopardized. ▪ Policy R-RC91: The application of historic district zoning to areas containing historic structures shall be encouraged. ▪ Policy R-RC92: The participation of concerned citizens and professionals dealing with heritage resources in the identification of sites and the review and conditioning of projects by its boards and commissions shall be encouraged by the County. Strategy #3: Restore, Enhance, and Commemorate Resources ▪ Policy R-RC93: Heritage resources should be restored, enhanced, and commemorated as appropriate to the value and significance of the resource. All historic rehabilitation activities should comply with the Secretary of Interior's Standards for Rehabilitation ▪ Policy R-RC94: Public awareness and appreciation of existing heritage resources and their significance should be enhanced through community organizations, neighborhood associations, the educational system, and governmental programs. ▪ Implementation Recommendation R-RC(i) 33: Utilize all financial resources available, including those from federal !STEA and income tax credits for rehabilitation of designated heritage resources. ▪ Implementation Recommendation R-RC(i) 34: Encourage and support efforts by local historians, educational institutions and others interested in recording oral histories and documenting the lives of the people of Santa Clara County who also make up an important but often overlooked part of the County's heritage.
City of Santa Clara 2010–2035 General Plan (2010)	
City of Santa Clara 2010–2035 General Plan (2010, updated 2018)	The City of Santa Clara adopted the *City of Santa Clara 2010–2035 General Plan* in November 2010. The plan includes the following goals and policies related to cultural resources: **Goals and Policies** ***Prerequisites*** ▪ Policy 5.1.1-P22: Prior to 2023, comprehensively update the City's list of Architecturally or Historically Significant Properties (Appendix 8.9), including evaluation of historic significance and statement of historic context for historic resources. ***General Land Use Policies*** ▪ Policy 5.3.1-P4: Encourage new development that meets the minimum intensities and densities specified in the land use classifications or as defined through applicable Focus Area, Neighborhood Compatibility or Historic Preservation policies of the General Plan. ▪ Policy 5.3.1-P20: Encourage uses and development on City-owned and leased land that is consistent with the General Plan land use classification or applicable Focus Area, Neighborhood Compatibility or Historic Preservation Policies. ***El Camino Real Focus Area Goals***

Plan and Policies	Summary
	▪ Goal 5.4.1-G2: High quality design that respects the scale and character of adjacent residential neighborhoods and historic resources and creates a walkable environment. ▪ Goal 5.4.2-P7: Apply the General Plan Transition and Historic Preservation policies for new development at the edges of Downtown in order to respect the scale and character of the adjacent historic Old Quad neighborhood. ▪ Goal 5.4.2-P17: Promote pedestrian-friendly streetscapes with trees, benches, outdoor seating, kiosks, amenities, banners and signature signage, and landscaping that reflect the historic neighborhood character. ***Discretionary Use Goals and Policies*** ▪ Goal 5.5.1-G2: Flexibility in permitted land uses, densities and intensities to support General Plan Major Strategies and goals and policies for Focus Areas, Historic Preservation, Mobility and Transportation, and Environmental Quality. ▪ Policy 5.5.1-P12: For City historically or architecturally significant properties, listed in Appendix 8.9, allow alternate uses from those on the General Plan Land Use Diagram in order to encourage preservation of the resource, provided that the alternate use is compatible with planned uses on neighboring properties and consistent with other applicable General Plan policies. ***Historic Preservation Goals and Policies*** Historic Preservation Goals and policies are applicable to the City's historic resources in order to provide the basis for their protection, reuse and identification in the City. These resources include historic structures, like the Berryessa Adobe, the Harris-Lass Historic Preserve and the Santa Clara Railroad Depot, as well as some of the City's historic homes in areas like the Old Quad. Appendix 8.9 includes the City's list of Architecturally or Historically Significant Properties. ▪ Goal 5.6.1-G1: Preservation of historic resources and neighborhoods. ▪ Goal 5.6.1-G2: Public awareness of the City's historic preservation programs. ▪ Goal 5.6.1-G3: Changes and maintenance of historic resources that retain the integrity of the property and its historic value. ▪ Policy 5.6.1-P1: Discourage the demolition or inappropriate alterations of historic buildings and ensure the protection of historic resources through the continued enforcement of codes and design guidelines. ▪ Policy 5.6.1-P2: Protect the historic integrity of designated historic properties and encourage adaptive reuse when necessary to promote preservation. ▪ Policy 5.6.1-P3: Protect historic resources from demolition, inappropriate alterations and incompatible development. ▪ Policy 5.6.1-P4: Use the City's Criteria for Local Significance as the basis for designating historic resources and review proposed changes to these resources for consistency with the Secretary of Interior Standards and California Historic Building Code. ▪ Policy 5.6.1-P5: Promote the use of the preservation standards outlined in the current Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings, for properties listed, or eligible for listing, on the City's list of Architecturally or Historically Significant Properties. ▪ Policy 5.6.1-P6: Promote an active program to identify, interpret and designate the City's historic properties, including the evaluation of resources over 50 years old to determine eligibility for the City's list of Architecturally or Historically Significant Properties. ▪ Policy 5.6.1-P7: Encourage programs that provide incentives and leverage public and private resources, to promote historic preservation, maintenance and adaptive reuse by property owners, such as Mills Act Contracts for tax benefits, tax credits and zero or low-interest loans for income-qualified residents.

Plan and Policies	Summary
	▪ Policy 5.6.1-P8: Coordinate historic preservation efforts with other agencies and organizations, including the Chamber of Commerce, Santa Clara County Historical and Genealogical Society, and other historical organizations. ▪ Policy 5.6.1-P9: Facilitate public outreach, education and information regarding historic preservation through the City's Historical and Landmarks Commission. ▪ Policy 5.6.1-P10: Update and maintain the City's list of Architecturally or Historically Significant Properties, and associated State Department of Parks and Recreation forms, as an Appendix to the General Plan. ***Areas of Historic Sensitivity Goals and Policies*** The area immediately surrounding historic resources contributes to the setting for the resource. It is important to review any changes in these areas with that in mind. The following goals and policies provide direction for all properties within a radius of 100 feet to City, State, or federally listed historic resources in the City. Relevant policies regarding transitions between uses may be found in Section 5.4: Neighborhood Compatibility. Appendix 8.9 includes an illustration of the Areas of Sensitivity for Agnew Village and the Old Quad (Figure 8.9-2). ▪ Goal 5.6.2-G1: New development that is compatible with nearby historic resources. ▪ Goal 5.6.2-G2: Preservation of the neighborhood context for historic resources. ▪ Policy 5.6.2-P1: Evaluate any proposed changes to properties within 100 feet of historic resources on the City's list of Architecturally or Historically Significant Properties for potential negative effects on the historic integrity of the resource or its historic context. ▪ Policy 5.6.2-P2: Require that changes to properties that contribute to the context of a historic resource are compatible in scale, materials, design, height, mass and use with the historic resource or its context. ▪ Policy 5.6.2-P3: Strengthen the character and historic context of the Old Quad historic neighborhood through streetscape design, amenities and street tree planting. ▪ Policy 5.6.2-P4: Work with Santa Clara University to improve compatibility between University-owned properties and nearby historic resources. ▪ Policy 5.6.2-P5: Work with off-campus housing providers to ensure that maintenance and operational provisions that protect nearby historic resources are implemented. ▪ Policy 5.6.2-P6: Provide notification and information to owners and developers of properties near historic resources in order to increase awareness of potential constraints on new development and/or uses. ***Archaeological and Cultural Resources Goals and Policies*** The City of Santa Clara is rich with archaeological and paleontological resources. These resources include the Santa Clara Mission, Native American burial grounds, the Berryessa Adobe and many others. The following Goals and Policies ensure that these resources are protected, now and into the future, and that appropriate mitigation measures to unforeseen impacts are enforced. ▪ Goal 5.6.3-G1: Protection and preservation of cultural resources, as well as archaeological and paleontological sites. ▪ Goal 5.6.3-G2: Appropriate mitigation in the event that human remains, archaeological resources or paleontological resources are discovered during construction activities. ▪ Policy 5.6.3-P1: Require that new development avoid or reduce potential impacts to archaeological, paleontological and cultural resources. ▪ Policy 5.6.3-P2: Encourage salvage and preservation of scientifically valuable paleontological or archaeological materials. ▪ Policy 5.6.3-P3: Consult with California Native American tribes prior to considering amendments to the City's General Plan.

Plan and Policies	Summary
	▪ Policy 5.6.3-P4: Require that a qualified paleontologist/archaeologist monitor all grading and/or excavation if there is a potential to affect archeological or paleontological resources, including sites within 500 feet of natural water courses and in the Old Quad neighborhood. ▪ Policy 5.6.3-P5: In the event that archaeological/paleontological resources are discovered, require that work be suspended until the significance of the find and recommended actions are determined by a qualified archaeologist/paleontologist. ▪ Policy 5.6.3-P6: In the event that human remains are discovered, work with the appropriate Native American representative and follow the procedures set forth in State law. **Appendix 8.9 - Historic Preservation And Resource Inventory** Table 8.9-1 and Figure 8.9-1 identify the names and locations of the historic properties in the City of Santa Clara. In addition, this Appendix includes a depiction of the Areas of Historic Sensitivity, defined as 100 feet from the property line of an identified historically significant property. Figure 8.9-2 shows this 100-foot area around historic properties in the Old Quad and Agnew neighborhoods where a number of the City's resources are located. **Appendix 8.10 - Heritage Tree Inventory** ▪ Heritage Tree Inventory as adopted by the City.
City of San Jose	
Envision: San José 2040 General Plan (2011)	The City of San Jose adopted the *Envision: San José 2040 General Plan* in 2011. The plan includes the following goals, policies, and actions related to cultural resources: General Goals ▪ Goal ER-10 Archaeology and Paleontology: Preserve and conserve archaeologically significant structures, sites, districts and artifacts in order to promote a greater sense of historic awareness and community identity. ▪ Policy ER-10.1 For proposed development sites that have been identified as archaeologically or paleontologically sensitive, require investigation during the planning process in order to determine whether potentially significant archeological or paleontological information may be affected by the project and then require, if needed, that appropriate mitigation measures be incorporated into the project design. ▪ Policy ER-10.2 Recognizing that Native American human remains may be encountered at unexpected locations, impose a requirement on all development permits and tentative subdivision maps that upon their discovery during construction, development activity will cease until professional archaeological examination confirms whether the burial is human. If the remains are determined to be Native American, applicable state laws shall be enforced. ▪ Policy ER-10.3 Ensure that City, State, and Federal historic preservation Laws, regulations, and codes are enforced, including laws related to archaeological and paleontological resources, to ensure the adequate protection of historic and pre-historic resources. ▪ Action ER-10.4 The City will maintain a file of archaeological and paleontological survey reports by location to make such information retrievable for research purposes over time. Historic Preservation ▪ Goal LU-13 Landmarks and Districts: Preserve and enhance historic landmarks and districts in order to promote a greater sense of historic awareness and community identity and contribute toward a sense of place. ▪ Policy LU-13.1: Preserve the integrity and fabric of candidate or designated Historic Districts.

Plan and Policies	Summary
	▪ Policy LU-13.2: Preserve candidate or designated Landmark buildings, structures and historic objects, with first priority given to preserving and rehabilitating them for their historic use, second to preserving and rehabilitating them for a new use, or third to rehabilitation and relocation on-site. If the City concurs that no other option is feasible, candidate or designated landmark structures should be rehabilitated and relocated to a new site in an appropriate setting. ▪ Policy LU-13.3: For landmark structures located within new development areas, incorporate the landmark structures within the new development as a means to create a sense of place, contribute to a vibrant economy, provide a connection to the past, and make more attractive employment, shopping, and residential areas. ▪ Policy LU-13.4: Require public and private development projects to conform to the adopted City Council Policy on the Preservation of Historic Landmarks. ▪ Policy LU-13.5: Evaluate areas with a concentration of historically and/or architecturally significant buildings, structures, or sites and, if qualified, preserve them through the creation of Historic Districts. ▪ Policy LU-13.6: Ensure modifications to candidate or designated landmark buildings or structures conform to the Secretary of the Interior's Standards for Treatment of Historic Properties and/or appropriate State of California requirements regarding historic buildings and/or structures, including the California Historical Building Code. ▪ Policy LU-13.7: Design new development, alterations, and rehabilitation/remodels within a designated or candidate Historic District to be compatible with the character of the Historic District and conform to the Secretary of the Interior's Standards for the Treatment of Historic Properties, appropriate State of California requirements regarding historic buildings and/or structures (including the California Historic Building Code) and to applicable historic design guidelines adopted by the City Council. ▪ Policy LU-13.8: Require that new development, alterations, and rehabilitation/remodels adjacent to a designated or candidate landmark or Historic District be designed to be sensitive to its character. ▪ Policy LU-13.9: Promote the preservation, conservation, rehabilitation, restoration, reuse, and/ or reconstruction, as appropriate, of contextual elements [e.g., structures, landscapes, street lamps, street trees, sidewalk design, signs) related to candidate and/or landmark buildings, structures, districts, or areas. ▪ Policy LU-13.10: Ensure City public works projects (street lights, street tree plantings, sidewalk design, etc.) promote, preserve, or enhance the historic character of Historic Districts. ▪ Policy LU-13.11: Maintain and update an Historic Resources Inventory in order to promote awareness of these community resources and as a tool to further their preservation. Give priority to identifying and establishing Historic Districts. ▪ Policy LU-13.12: Develop and encourage public/public and public/private partnerships as a means to support, expand, and promote historic preservation. ▪ Policy LU-13.13: Foster the rehabilitation of buildings, structures, areas, places, and districts of historic significance. Utilize incentives permitting flexibility as to their uses: transfer of development rights: tax relief for designated landmarks and districts; easements; alternative building code provisions for the reuse of historic structures; and financial incentives. ▪ Policy LU-13.14: Advocate for the continuation and appropriate expansion of Federal and State tax and/or other incentives for the rehabilitation and/or restoration of historically or architecturally significant buildings, structures, areas, and/or places. ▪ Policy LU-13.15: Implement City, State, and Federal historic preservation laws, regulations, and preservation goals and policies and their implications early in the development process.

Plan and Policies	Summary
	▪ Policy LU-13.16: Alert property owners, land developers, and the building industry to historic preservation goals and policies and their implications early in the development process. ▪ Action LU-13.17: Amend the City's Historic Preservation Ordinance to specify that a Contributing Structure to a City Historic District is eligible for consideration of a Mills Act contract and to require Historic Preservation Permits and/or Adjustments for modifications to buildings, structures, and/or sites in a National Register Historic District. ▪ Action LU-13.18: Explore establishing a grant program for historic preservation, potentially partnering with Preservation Action Council San Jose, History San Jose, or other organizations. ▪ Action LU-13.19: Continue to identify landmarks, landmark districts and Conservation Areas on the Land Use/Transportation Diagram as Areas of Historic Sensitivity. ▪ Action LU-13.20: Explore funding options and techniques to proactively conduct additional historic surveys and to maintain and update the City's Historic Resources Inventory. As funding allows, undertake comprehensive area-wide surveys of the City to identify potential Historic Districts. Cultural Landscapes at the City's edge, and significant buildings and/or structures, including Traditional Cultural Properties. ▪ Action LU-13.21: Implement strategic General Plan and zoning changes as indicated by federal, state or municipal "Historic" or "Conservation Area" designations, in order to maintain neighborhood vitality and character and to preserve the integrity of historic structures located within those neighborhoods. To preserve predominantly single-family historic neighborhoods, rezone residential structures located in these areas to a single-family zoning designation. ▪ Action LU-13.22: Require the submittal of historic reports and surveys prepared as part of the environmental review process. Materials shall be provided to the City in electronic form once they are considered complete and acceptable. ▪ Action LU-13.23: Maintain a file of historic survey reports by location by the City of San Jose to make the information retrievable for research purposes. ▪ Action LU-13.24: For vacant lands at the edge of the Urban Growth Boundary in the Almaden, Alviso, and Coyote Planning Areas, require investigation during the development review process to determine whether significant Cultural Landscapes or Traditional Cultural Properties eligible for the National Register of Historic Places may be affected by the project and then require, if needed, that appropriate mitigation measures be incorporated into the project design. ▪ Goal LU-14 Historic Structures of Lesser Significance: Preserve and enhance historic structures of lesser significance (i.e., Structures of Merit, Identified Structures, and particularly Historic Conservation Areas) as appropriate, so that they remain as a representation of San Jose's past and contribute to a positive identity for the City's future. ▪ Policy LU-14.1: Preserve the integrity and enhance the fabric of areas or neighborhoods with a cohesive historic character as a means to maintain a connection between the various structures in the area. ▪ Policy LU-14.2: Give high priority to the preservation of historic structures that contribute to an informal cluster or a Conservation Area; have a special value in the community; are a good fit for preservation within a new project; have a compelling design and/or an important designer: etc. ▪ Policy LU-14.3: Design new development, alterations, and rehabilitation/remodels in Conservation Areas to be compatible with the character of the Conservation Area. In particular, projects should respect character defining elements of the area that give the area its identity. These defining characteristics could vary from area to area and could include density, scale, architectural consistency, architectural variety, landscape, etc.

Plan and Policies	Summary
	▪ Policy LU-14.4: Discourage demolition of any building or structure listed on or eligible for the Historic Resources Inventory as a Structure of Merit by pursuing the alternatives of rehabilitation re-use on the subject site, and/or relocation of the resource. ▪ Policy LU-14.5: Continue and strengthen enforcement programs, such as those addressing vacant buildings, to promote the maintenance and survival of all classes of the city's historic and cultural resources. ▪ Policy LU-14.6: Consider preservation of Structures of Merit and Contributing Structures in Conservation Areas as a key consideration in the development review process. As development proposals are submitted, evaluate the significance of structures, complete non-Historic American Building Survey level of documentation, list qualifying structures on the Historic Resources Inventory, and consider the feasibility of incorporating structures into the development proposal, particularly those structures that contribute to the fabric of Conservation Areas. ▪ Policy LU-14.7: Ensure City public works projects [street lights, street tree planting, sidewalk design, etc.) promote, preserve, or enhance the historic character of Conservation Areas. ▪ Policy LU-14.8: Perform modifications to the exterior of any building or structure located in a Conservation Area in a manner consistent with any and all design guidelines approved or accepted by the City Council for the preservation of historic buildings or structures. ▪ Action LU-14.9: Amend applicable design guidelines and City policies to add flexibility in the development review process (for example, with regulations related to parking, independently accessible private open spaces, requirement for units to be attached, etc.) to encourage the preservation, conservation, rehabilitation, reuse, or relocation of historic resources consistent with the character and needs of the surrounding properties and uses. ▪ Goal LU·15 - Public Awareness: Increase public awareness and understanding of the history of San Jose, historic preservation, and its importance to the economic and cultural vitality of the City. ▪ Policy LU-15.1: Encourage widespread public participation in the identification and designation of historically or culturally significant buildings, structures, sites, areas. and/or places to update and maintain the City's Historic Resources Inventory. ▪ Policy LU-15.2: Foster a community sense of stewardship and personal responsibility for all historic and cultural resources. ▪ Policy LU-15.3: Encourage public accessibility and/or use of City Landmark, California Register, and National Register buildings, structures, areas, places, and sites, even if only for temporary or special events. ▪ Policy LU-15.4: Educate/inform the public of the importance of San Jose's strong historic connections to past industry. To serve as a link between San Jose's present and past, preserve historical resources from agriculture to high-tech whenever possible, feasible, and appropriate. ▪ Action LU-15.5: Work with neighborhood groups and historic preservation advocacy groups on events, materials. and efforts to educate the public on the positive benefits of historic preservation generally and in specific neighborhoods. ▪ Action LU-15.6: Expand resources such as historic maps, historic markers, or self-guided walking tours as a means to promote and celebrate historic preservation in San Jose. ▪ Goal LU-16 Sustainable Practices: Preserve, conserve, and/or rehabilitate historic structures as a means to achieve the City of San Jose's environmental, economic, and fiscal sustainability goals. ▪ Policy LU-16.1: Integrate historic preservation practices into development decisions based upon fiscal, economic, and environmental sustainability.

Plan and Policies	Summary
	▪ Policy LU-16.2: Evaluate the materials and energy resource consumption implications of new construction to encourage preservation of historic resources. ▪ Policy LU-16.3: Encourage sustainable energy, water. and material choices that are historically compatible as part of the preservation, conservation, rehabilitation, and/or reuse of historical resources. ▪ Policy LU-16.4: Require development approvals that include demolition of a structure eligible for or listed on the Historic Resources Inventory to salvage the resource's building materials and architectural elements to allow re-use of those elements and materials and avoid the energy costs of producing new and disposing of old building materials. ▪ Policy LU-16.5: Utilize the aesthetic and cultural qualities of historic resources of all types as means of promoting San Jose as a place to live, work and visit consistent with the City's economic development goals. ▪ Action LU-16.6: Explore the revision of the Construction and Demolition Diversion Deposit (CDDD) program to eliminate the deposit requirement for projects proposing rehabilitation of a historic landmark, a property in a Historic District, or the conservation of more than 75% of a Structure of Merit or structure in a Conservation Area. ▪ Action LU-16.7: Work with agencies, organizations, property owners, and business interests to develop and promote heritage tourism opportunities as an economic development tool.
Midtown Specific Plan (1992)	The City of San Jose adopted the *Midtown Specific Plan* in 1992. The plan includes the following objectives and policies related to cultural resources: **Task Force Objectives** ▪ Land Use: (4) Introduce land uses that complement the existing character of adjacent single-family neighborhoods; ensure that new development immediately adjacent to these neighborhoods has a similar height, scale and orientation as the historic fabric of single-family homes; (7) Retain historic elements and features that convey the unique history and role of Midtown, and incorporate them within new development in a meaningful and viable manner. **Land Use and Urban Design** ▪ Cahill East Subarea Policy 3.6: Cahill Station should be enhanced as a major historic and visual landmark within the Cahill East subarea. ▪ Public/Quasi-Public (PQP) Designated Land Compatibility with Cahill Station: Special consideration should be given to ensure that all development located adjacent to Cahill Station employs architectural treatments and materials that are compatible and complementary with the historic Cahill Station. ▪ Public Parking Facilities: Public parking structures built along Cahill Street should be designed in a manner compatible with the historic station structure, utilizing an architectural treatment on the building facade that screens views to automobiles and creates a complementary building rhythm. ▪ Lincoln-Auzerais Subarea Policy 5.5: The Del Monte water tower should be preserved as a major visual landmark within the area. **Implementation** ▪ Objective 4: The preservation of historic resources should be encouraged wherever practicable. ▪ Policy 4.1: The Midtown Specific Plan provides flexibility in use and density/intensity of uses to facilitate the preservation of historic resources, as set forth in Discretionary Alternate Use Policy #3 in the Horizon 2000 General Plan. ▪ Policy 4.2: Businesses located in historic structures, whether designated a landmark or not, are encouraged to continue their operations

Plan and Policies	Summary
Tamien Station Area Specific Plan (1995)	The City of San Jose adopted the *Tamien Station Area Specific Plan* on March 21, 1995. The plan includes the following objectives and policies related to cultural resources: **Task Force Objectives** ▪ Land Use Constraints: (2) Archaeological and cultural resources may limit the location and extent of new development to preserve or avoid damaging these resources. **Implementation** ▪ Archaeological Resources Mitigation: New development on larger parcels should be required to conduct mechanical archaeological testing and, if necessary, more detailed in-field hand excavation and archaeological monitoring if resources are discovered. ▪ Historic Preservation Mitigation: The Italian Gardens complex should be added to the City's Historic Resources Inventory. In addition, the Historic Landmarks Commission should consider designating this site as an Historic Landmark. ▪ Italian Gardens – Historic Preservation: Any modification or removal of Italian Gardens complex buildings should be allowed only after the preparation of a more detailed Historic Resources Report which will expand on the initial analysis prepared for the specific plan EIR.
City of Morgan Hill	
Morgan Hill 2035 General Plan (2016)	The City of Morgan Hill adopted the *Morgan Hill 2035 General Plan* on July 27, 2016. The plan includes the following goals, policies, and actions related to cultural resources: **Healthy Community Element** ▪ Goal HC-8: Historic identity and cultural resources that are preserved for future generations. ▪ Policy HC-8.1: Identify and Protect Resources. Identify and protect heritage resources from loss and destruction (South County Joint Area Plan 15.09). ▪ Policy HC-8.2: Historic Structures. Encourage the preservation and rehabilitation of the City's historic structures. ▪ Policy HC-8.3: Demolition. Prior to approving demolition or alteration of historically significant buildings, evaluate alternatives, including structural preservation, relocation, or other mitigation, and demonstrate that financing has been secured for replacement use. ▪ Policy HC-8.4: Tribal Consultation. Consult with Native American tribes that have ancestral ties to Morgan Hill regarding proposed new development projects and land use policy changes. ▪ Policy HC-8.5: Mitigation. Require that if cultural resources, including tribal, archaeological, or paleontological resources, are uncovered during grading or other on-site excavation activities, construction shall stop until appropriate mitigation is implemented. ▪ Action HC-8.A: Update Inventory. Review and update the inventory of historic resources. ▪ Action HC-8.B: Technical Assistance. Provide clear and easily accessible information to property owners and developers about design guidelines, financing options, assistance programs, and other technical issues involved in preserving and restoring historic buildings.
Morgan Hill Downtown Specific Plan (2009)	The City of Morgan Hill adopted the *Morgan Hill Downtown Specific Plan* on November 4, 2009. The plan includes the following guidelines and policies related to cultural resources: **Design Guidelines** ▪ Design Principle #2: Buildings along Monterey Road and Third Street should be designed in an architectural style compatible with traditional Main Street buildings. ▪ Policy DG-A17: Follow the Secretary of the Interior's standards when renovating or modifying historic buildings.

Plan and Policies	Summary
	▪ Policy DG-C3: Reflect the architecture of Morgan Hill in new buildings. **Implementation and Plan for Investment** ▪ Historic Preservation: Provide loans/grants to preserve historic resources in Downtown, such as the Morgan Hill United Methodist Church property.
Code of Ordinances (City of Morgan Hill)	Chapter 18.75 of the City of Morgan Hill's Code of Ordinances focuses on Historical Resources. The purpose of this chapter is to promote the public health, safety and general welfare by providing for the identification, protection, enhancement, perpetuation and use of historical resources, including buildings, structures, signs, objects, features, sites, historic and prehistoric archaeological sites, places, districts, designed landscapes, cultural landscapes and areas within the city that reflect special elements of the city's architectural, artistic, cultural, engineering, aesthetic, historical, political, social and other heritage.
City of Gilroy	
City of Gilroy 2002–2020 General Plan (2002)	The City of Gilroy adopted the *City of Gilroy 2002–2020 General Plan* in 2002. The plan includes the following directions, goals, policies, and actions related to cultural resources: Strategic Direction The Strategic Direction section of the General Plan recommends that the Downtown Commercial district be subdivided into three sub-districts with differing uses, design character and planning requirements. One of the three proposed sub-designations for Downtown is a Downtown Historic District. Primary goals in this area are: restoration and adaptive reuse of historic buildings, compatibility of architectural styles, and enhancement of the area's overall visual character. The Strategic Direction section identifies historic preservation as an economic development opportunity, noting that historic preservation "is an important concern in the Downtown core, with the area's historic character providing a valuable asset for economic development. ▪ Policy 3.30: Historic Preservation, Restoration, and Re-Use in the Downtown Area Community Design and Development Element ▪ Goal 5: Historic Preservation - A strong sense of connection to Gilroy's past through historical, archaeological, and paleontological resources that are preserved, protected, enhanced, and commemorated for the benefit of current and future generations. ▪ Policy 5.01: Encourage public and private efforts for the preservation of historic and architecturally significant buildings, archaeological sites, and other landmarks that give residents a tie with the past. ▪ Policy 5.02: Seek state and federal funding for the preservation of buildings of historical merit and consider public/private partnerships for capital and program improvements. ▪ Policy 5.03: Encourage preservation of older homes, other structures, and neighborhood districts to maintain and enhance the historic character of the city. In particular, encourage the retention and rehabilitation of older homes in and near the historic city center (roughly bound by First Street on the north, Princeville on the west, Tenth Street on the south, and Chestnut/Murray on the east) and ensure that rehabilitation activities are sensitive to the historic character of the building and/or site. ▪ Policy 5.04: Designate a Downtown Historic District and promote the preservation of historic buildings within the district area to reinforce Downtown's historic character and scale. Provide incentives for the retention and rehabilitation of buildings with historic merit. ▪ Policy 5.05: Promote adaptive reuse of buildings, especially in the Downtown Historic District, to preserve the buildings' historic character while encouraging development of an economically vital Downtown. ▪ Policy 5.06: Allow non-conforming uses in designated Historic Structures. In some situations, a historic building can be retained only if it can be used for an activity that

Plan and Policies	Summary
	would not normally be permitted under the zoning classification. The City may consider conditional use permits where the proposed use will not have a detrimental effect on the neighborhood and will be in keeping with the historic nature of the building, taking into consideration parking needs and compatibility of the use to neighboring uses. ▪ Policy 5.07: Archaeological Resources. If archaeological resources or human remains are discovered during construction, work shall be halted within 50 meters (150 feet) of the find until it can be evaluated by a qualified professional archaeologist. If the find is determined to be significant, appropriate mitigation measures shall be formulated and implemented. ▪ Implementing Action 5.A: Historic Preservation Designations - Continue to designate buildings, sites, features and districts based upon their historic value, and work towards their preservation. Two types of designations apply: 1. Historic Buildings and Sites, these are individual structures, sites, or features of historic value, whether or not they are located in a historic preservation district; 2. Historic Preservation Districts, these are areas that contain a significant number of structures, sites, or features worthy of preservation. Although each and every structure in such an area may not be historically significant, the structures collectively, together with other features such as mature trees, flower gardens, etc., constitute an area worthy of preservation. A Historic Preservation District may include a block or part of a block or may consist of an entire neighborhood. ▪ Implementing Action 5.B: Review of Structural Modifications and Use Changes - For designated Historic Structures and of structures within a Historic Preservation District, submit proposed structural modifications that change the exterior appearance and proposed use changes to the Historic Heritage Committee and the Planning Commission for review and approval. ▪ Implementing Action 5.C: Environmental Impact Reports for Historic Structures - Require an Environmental Impact Report (EIR) for any proposed demolition of a designated Historic Structure, with consultation of the Historic Heritage Committee in preparation of the EIR. For demolition of a structure within a Historic Preservation District, determination will be made by the Planning Division Manager on whether a negative declaration or EIR is appropriate. Following the Public Hearing of the EIR, the Planning Commission would pass the EIR and the request for demolition permit, along with its comments and recommendations, to the City Council for action. The Council would have the power to postpone, without undue delay, approval of a demolition permit for any structure in a Historic Preservation District or any designated Historic Structure to provide interested parties an opportunity to preserve the structure. In the case of historic structures heavily damaged by fire, earthquake, or other natural disaster, the EIR requirement for demolition may be waived. ▪ Implementing Action 5.D: Design Review in Historic Preservation Districts - Evaluate projects in Historic Preservation Districts for compatibility with the surrounding neighborhood. Review and approval authority shall be with the Historic Heritage Committee. ▪ Implementing Action 5.E: Survey of Historic Structures - Periodically update the City's Survey of Historic Structures. ▪ Implementing Action 5.F: Public Information Program on Historic Preservation - Continue to provide public information to increase awareness of historic preservation. ▪ Implementing Action 5.G: Mills Act Agreements - Support the development of Mills Act Agreements for historic properties to provide reductions in property taxes, in keeping with the City's adopted Mills Act Agreement Policy. ▪ Implementing Action 5.H: Historic Preservation Ordinance - Adopt a Historic Preservation Ordinance and submit it for certification by the Secretary of the Interior so that owners of designated historic buildings can apply for tax relief. ▪ Implementing Action 5.I: Archeological Assessments - Require an archeological assessment for all CEQA projects (i.e., projects requiring an environmental assessment)

Plan and Policies	Summary
	in potentially sensitive archeological areas (as indicated on the City's Historic and Cultural Re¬ sources Map). The assessment shall consist of a preliminary survey and, if evidence of sites is found, a test-level investigation.
City of Gilroy Historic Sites Inventory (1986)	The City of Gilroy created an inventory of historic sites in 1986. Any buildings on the inventory that are assigned a rating of 3, 4, or 5 are considered to be significant. Major project proposals related to significant historic sites must be approved by the Historic Heritage Committee and Planning Commission through the architectural and site review processes.
Downtown Gilroy Specific Plan (2005)	The City of Gilroy adopted the *Downtown Gilroy Specific Plan* on November 21, 2005. The plan includes guidance related to cultural resources, including design guidelines for the Downtown Historic District zoning area; a recommendation to restore historic buildings Downtown to add to the area's unique character; and suggestions for historic preservation as incentive/public benefit.
San Benito County	
San Benito County 2035 General Plan (2015)	San Benito County adopted the *San Benito County 2035 General Plan* in 2015. The plan includes the following goals and policies related to cultural resources: ▪ Goal LU-1: To maintain San Benito County's rural character and natural beauty while providing areas for needed future growth. ▪ Policy LU-1.10: Development Site Suitability - The County shall encourage specific development sites to avoid natural and manmade hazards, including, but not limited to, active seismic faults, landslides, slopes greater than 30 percent, and floodplains. Development sites shall also be on soil suitable for building and maintaining well and septic systems (i.e., avoid impervious soils, high percolation or high groundwater areas, and provide setbacks from creeks). The County shall require adequate mitigation for any development located on environmentally sensitive lands (e.g., wetlands, erodible soil, archaeological resources, important plant and animal communities). ▪ Goal LU-7: To preserve San Benito County's historic identity and rural community character. ▪ Policy LU-7.1: Historic Communities and Structures - The County shall protect historic communities and structures by requiring new or remodeled development to respect their architectural and historical significance. ▪ Policy LU-7.2: Historic Preservation - The County shall coordinate with property owners, neighborhood associations, and preservation groups to improve building facades and exteriors consistent with each community's unique history and visual character. ▪ Policy LU 7.3: Adaptive Reuse - The County shall encourage the adaptive reuse of historic structures in order to preserve the historic resources, so long as the reuse of the structure is consistent with the individual history of each community. ▪ Policy LU 7.4: New Development in Historical Areas - The County shall require new development in historical areas to be compatible with existing historic structures. ▪ Policy LU-7.8: Signage Program - The County should develop, adopt, and maintain a unified signage and way-finding program that identifies historic communities and structures and directs residents and visitors to points of interest. Economic Development Element ▪ Goal ED-5: To expand tourism opportunities in order to make the county a premier destination. ▪ Policy ED 5.2: Heritage Tourism Promotion - The County shall coordinate with agencies, organizations, property owners, and business interests to develop and promote heritage tourism opportunities in the county. Heritage tourism refers to experiencing the places,

Plan and Policies	Summary
	artifacts, and activities that authentically represent the stories and people of the past and present. This can include cultural, historic, and natural resources. Natural and Cultural Resources Element ▪ Goal NCR-1: To preserve and enhance valuable open space lands that provide wildlife habitat and conserve natural, historical, archaeological, paleontological, tribal, and visual resources of San Benito County. ▪ Policy NCR-1.1: Maintenance of Open Space - The County shall support and encourage maintenance of open space lands that support natural resources, agricultural resources, recreation, tribal resources, wildlife habitat, water management, scenic quality, and other beneficial uses. ▪ Policy NCR-1.3: Open Space Overlay District - The County shall continue to protect and preserve the rural landscape and implement open space policies for: public health, safety, and welfare; continued agricultural uses; scenic viewscape preservation, including scenic highway corridors; park and recreation uses; conservation of significant natural resources; the containment and definition of limits to urbanization; and the preservation of the natural habitat for threatened and/or endangered plant and animal species. ▪ Goal NCR-7: To protect, preserve, and enhance the unique cultural and historic resources in the county. ▪ Policy NCR-7.1: Historic Districts - The County shall establish historic districts for the communities of Tres Pinos and New Idria to preserve the character of these historic communities. ▪ Policy NCR-7.2: Commercial Recreational Uses - The County shall promote commercial recreational uses in underutilized historic structures. ▪ Policy NCR-7.3: Assemble Information - The County shall cooperate with the Historical Society and other organizations to assemble information on historic areas of the county that should be preserved. ▪ Policy NCR-7.4: Integrate Architectural Styles - The County shall protect existing historic structures by requiring nearby new development to use architectural styles that complement the historic structures and by striving to ensure roadway improvements enhance and do not detract from nearby historic resources. ▪ Policy NCR-7.5: Preservation of Structures - The County shall require development proposals that would remove structures 100 years or older to demonstrate why preservation of the structures and integration of the structures into the development proposal is inappropriate or infeasible. ▪ Policy NCR-7.6: Historic Consultant - The County shall retain an historic consultant at the developer's expense to evaluate the historic merits of existing structures, make recommendations for the new development, and, if necessary, to review building elevations for new development. ▪ Policy NCR-7.7: Resource Identification and Preservation - The County shall maintain a register of historic properties that will be used during the design review process to protect the character of historic communities in the county. ▪ Policy NCR-7.8: Adaptive Reuse of Historic Structures - The County shall encourage the adaptive reuse (e.g., converting a historic building to residential use) of historic resources when the original use of the resource is no longer feasible and when the new use is allowed by the underlying land use designation and zoning district. ▪ Policy NCR-7.9: Tribal Consultation - The County shall consult with Native American tribes regarding proposed development projects and land use policy changes consistent with the State's Local and Tribal Intergovernmental Consultation requirements. ▪ Policy NCR-7.10: Cultural Resources Education - The County shall educate the public regarding laws, codes, and ordinances that forbid collecting items associated with tribal,

Plan and Policies	Summary
	archeological, historical, and paleontological sites, and unique geological formations, particularly artifacts or other objects found in association with human remains. ▪ Policy NCR-7.11: Prohibit Unauthorized Grading - The County shall prohibit unauthorized grading, collection, or degradation of Native American, tribal, archaeological, or paleontological resources, or unique geological formations. ▪ Policy NCR-7.12: Archaeological Artifacts - The County shall require an archaeological report prior to the issuance of any project permit or approval in areas determined to contain significant historic or prehistoric archaeological artifacts and when the development of the project may result in the disturbance of the site. The report shall be written by a qualified cultural resource specialist and shall include information as set forth in the county's archaeological report guidelines available at the County Planning Department. ▪ Goal NCR-8: To enhance and preserve the attractive visual qualities of scenic vistas and corridors in the county. ▪ Policy NCR-8.1: Protect Scenic Corridors - The County shall endeavor to protect the visual characteristics of certain transportation corridors that are officially designated as having unique or outstanding scenic qualities. ▪ Policy NCR-8.2: Sign Regulations within Scenic Corridors - The County shall require the elimination of signs within Scenic Corridors other than those identified in the permitted use section of the Zoning Ordinance. ▪ Policy NCR-8.3: Grading within Scenic Corridors - The County shall review all projects involving grading within Scenic Corridors to protect valuable soil resources, preserve the natural environment, and avoid significant adverse impacts within scenic areas. ▪ Policy NCR-8.4: Review Architectural Massing - The County shall review development proposals to ensure that the obstruction of views is minimized through architectural building massing and location that is compatible with scenic areas. ▪ Policy NCR-8.5: Review Site Planning - The County shall review development proposals to ensure a reasonable and attractive appearance from the highway concurrent with a harmonious relationship with the existing landscape and shall require development that determined not to be in harmonious relationship with the existing landscape to be screened from view through planting or other forms of visual buffers. ▪ Policy NCR-8.6: Regulate Building Height and Setback - The County shall regulate building height and setbacks to protect the field of vision within an officially designated Scenic Corridor. The County shall not approve building heights that exceed, nor setback requirements that are less, than those of the basic zoning district unless such variance has had the appropriate review and public comment. ▪ Policy NCR-8.9: Hillside and Ridgeline Protection - The County shall use design review for development on hillsides and within Scenic Corridors to protect the hillsides and ridgelines that are a unique scenic resource in the County. The County shall prohibit development within 100 vertical feet of any ridgeline unless there are no site development alternatives. ▪ Policy NCR-8.10: Sign Ordinance - The County shall maintain and implement the Sign Ordinance to control the locations and types of signs throughout the county in an effort to protect the county's scenic character. ▪ Implementation Program NCR-G: Historic and Archeological Resources Information - The County shall prepare and distribute, as necessary, information related to inventories of historic resources in the county. This should include educational materials regarding the laws, codes, and ordinances that forbid collecting of items associated with archeological, historical, and paleontological sites, particularly artifacts or other objects found in association with human remains. Health and Safety Element

Plan and Policies	Summary
	▪ Goal HS-3: To protect lives and property from seismic and geologic hazards. ▪ Policy HS-3.5: Historic Structures - The County shall consider historic community resources in the abatement of unsafe structures and shall strive to preserve the essential qualities of historic buildings while improving structural safety.
Merced County	
2030 Merced County General Plan (2013)	Merced County adopted the *2030 Merced County General Plan* in 2013. The plan includes the following goals and policies related to cultural resources: Land Use Element ▪ Goal LU-5.B: Preserve and enhance the design, heritage, historic character, and quality of life of Urban Communities in Merced County. ▪ Policy LU-5.B.9: Adaptive Reuse - Encourage and promote the presentation and adaptive reuse of locally, State, or Federally listed historic resources and structures in order to preserve Merced County's historic heritage. Natural Resources Element ▪ Program NR-F: Ongoing Inventory of Open Space Resources. The County shall maintain an open space and conservation inventory to delineate those areas that have significant open space or conservation value. Those areas include agricultural lands, native pasture lands, parks and recreation areas, historic resources, scenic highways, wetland, wildlife and vegetation habitat resources, mineral and energy resource areas, fire hazard areas, geologic and flood hazard areas, noise impacted areas and other resource and hazard areas. Recreation and Cultural Resources Element ▪ Goal RCR-2. Protect and preserve the cultural, archaeological, and historic resources of the County in order to maintain its unique character. ▪ Policy RCR-2.1: Archaeological Site and Artifact Protection. Require development projects that affect archaeological sites to avoid disturbance or damage to these sites. ▪ Policy RCR-2.2: Historical Area Preservation. Support the preservation of historical structures and areas, particularly those listed on the National Register of Historic Places and the California Register of Historical Resources. ▪ Policy RCR-2.3: Architectural Character Preservation. Require that the original architectural character of significant State- and Federally-listed historic structures be maintained in compliance with preservation standards and regulations. ▪ Policy RCR-2.4: Park and Open Space Historic Resource Preservation. Require the preservation of historic resources located in parks and publically-owned open space areas. ▪ Policy RCR-2.5: Human Remains Discovery. Require that, in the event of the discovery of human remains on any project construction site, all work in the vicinity of the find will cease and the County Coroner and Native American Heritage Commission will be notified. ▪ Policy RCR-2.6: Historic Buildings and Areas. Identify and preserve buildings and areas with special and recognized historic, architectural, or aesthetic value during the Community Plan update process. New development should response architecturally and historically significant buildings and areas. ▪ Policy RCR-2.7: Historic Preservation. Support the efforts of local preservation groups and community property owners to preserve or improve building facades and exteriors consistent with the historic and visual character of the specific building or area. ▪ Policy RCR-2.8: Historical Preservation Area/Site Designations. Allow sites of historical and archaeological significance to be designated as historical preservation areas or sites during the Community Planning process or on individual sites in rural areas.

Plan and Policies	Summary
	▪ Policy RCR-2.9: Historical and Cultural Resources Investigation, Assessment, and Mitigation Guidelines. Establish and adopt mandatory guidelines for use during the environmental review processes for private and public projects to identify and protect historical, cultural, archaeological, and paleontological resources, and unique geological features. ▪ Policy RCR-2.10: Tribal Consultation - Consult with Native American tribes regarding proposed development projects and land use policy changes consistent with Planning and Zoning Law at Government Code Section 65351, and the OPR Tribal Consultation Guidelines (2005). ▪ Program RCR-B: Historic and Cultural Resources Investigation, Assessment and Mitigation Guidelines. Prepare and formally adopt guidelines and standards for the preparation of assessments of historical, cultural, archaeological, and paleontological resources, and unique geological features prepared pursuant to Policy RCR-2.9. At a minimum, the guidelines shall include resource survey guidelines covering personnel qualifications, research and field techniques, investigation and documentation, data collection and recordation, and resource preservation, avoidance, minimization, and mitigation strategies. The guidelines shall specify broad categories of acceptable mitigation consistent with Public Resources Code Section 21083.2 and State CEQA Guidelines Section 15126.4(b), as they may be amended for any identified adverse effects to historic and cultural resources, paleontological resources, or unique geological features.

Regional Growth

Table 18 Regional and Local Plans and Policies Relevant to Regional Growth

Policy Title	Summary
Regional	
Plan Bay Area (ABAG and MTC 2017)	The Association of Bay Area Governments and the Metropolitan Transportation Commission adopted Plan Bay Area as the Bay Area's long-term regional transportation and land use blueprint in 2013. The following goals and objectives are relevant to the project: ▪ Target #2: House 100 percent of the region's projected growth (from a 2010 baseline year) by income level (very-low, low, moderate, above-moderate) without displacing current low-income residents (Statutory requirement, per SB 375). ▪ Target #6: Direct all nonagricultural development within the year 2010 urban footprint (existing urban development and urban growth boundaries). ▪ Target #8: 8 Increase gross regional product by 110 percent — an average annual growth rate of approximately 2 percent (in current dollars). Plan Bay Area 2040 is an update to Plan Bay Area 2013. The Preferred Scenario for Plan Bay Area 2040 was adopted in December 2016, and the Final Plan Bay Area 2040 and Environmental Impact Report was adopted on July 27, 2017.
2035 Metropolitan Transportation Plan/ Sustainable Communities Strategy (AMBAG 2014)	The Association of Monterey Bay Area Governments adopted the *2035 Metropolitan Transportation Plan/Sustainable Communities Strategy*, which includes San Benito County, in 2014. The following themes and policies are relevant to the project:

Policy Title	Summary
	▪ Economic vitality—Raise the region's standard of living by enhancing the performance of the transportation system. ▪ System preservation and safety—Preserve and ensure a sustainable and safe regional transportation system. AMBAG is developing a technical update to the current *2035 Metropolitan Transportation Plan/ Sustainable Communities Strategy*. The *2040 Metropolitan Transportation Plan/ Sustainable Communities Strategy* is scheduled for adoption in June 2018.
San Joaquin Valley Blueprint Planning Process Summary Report (San Joaquin Valley Regional Planning Agencies 2010)	The San Joaquin Valley Regional Planning Agencies published the *San Joaquin Valley Blueprint Planning Process Summary Report* (2010). The report is a plan for the future of the San Joaquin Valley. The following principles are relevant to the project: ▪ Create a range of housing opportunities and choices ▪ Make development decisions predictable, fair, and cost-effective ▪ Mix land uses ▪ Take advantage of compact building design ▪ Enhance the economic vitality of the region
2014–2020 Regional Transportation Plan and Sustainable Communities Strategy for Merced County (MCAG 2014)	The Merced County Association of Governments adopted the *2014–2020 Regional Transportation Plan and Sustainable Communities Strategy for Merced County* in 2014 and amended it in 2016. The following themes and policies are relevant to the project: ▪ Support full-time employment with livable wages; i.e., support job creation & economic vitality. ▪ Support orderly and planned growth that enhances the integration and connectivity of various modes of transportation. ▪ Policy 9.2: Plan future roads to accommodate land uses at a regional level. ▪ Policy 12.1: Prioritize infill and growth in existing communities. Direct growth through infill strategies that promote increased investment in existing communities—prioritizing disadvantaged neighborhoods and communities - that provide a range of housing choices (affordable small, medium, large lot single family and multifamily housing) for existing and new residents. Direct housing and employment growth to existing cities and unincorporated communities rather than directing growth to new town development and sprawl.
County of Santa Clara	
Santa Clara County General Plan (County of Santa Clara 1994)	Santa Clara County adopted the *Santa Clara County General Plan* in 1994. The following goals and policies are relevant to the project: ▪ Strategy #1: Promote Compact Urban Development Patterns ▪ C-GD 1: Most of the future urban growth of Santa Clara County should be accommodated within the existing urban areas, through infill development, rather than through expansion of the urbanized area into hillsides and resource areas. ▪ C-GD(i) 3: Continue support for city's efforts to promote appropriate infill of existing vacant lands and redevelopment through their general plans, development regulations, specific plans, as well as other implementing mechanisms. ▪ C-GD 30: Cities should make maximum use of vacant or underutilized lands within the existing urban area for application of compact and mixed use development principles. Wherever possible, expansion of the urbanized area should also incorporate such principles.

Policy Title	Summary
	▪ C-GD 31: Mixed land use and compact developments should be encouraged in urban areas wherever appropriate and compatible with city plans and existing development for the purposes of enhancing community identity, creating more affordable housing, reduced auto dependency, trip reduction, and improved environmental quality. ▪ C-GD 32: Mixed land use and compact development should be encouraged which clusters employment, residential, and the types of land uses, goods, and services customarily needed on a daily basis around transit stations, along transit corridors, and in other appropriate urban locations. ▪ C-GD 38: Increases in employment should be consistent with the following: a. the rate of housing supply increase; b. the ability of cities and districts to provide needed urban services and infrastructure without lessening levels of service to existing neighborhoods; and c. the attainment of environmental quality standards. ▪ C-GD 40: Improved balance between employment and housing opportunities should include the need for: a. increased overall supply and more varied types of housing; b. housing costs commensurate with household income distribution; and c. increased proximity of housing to employment centers. ▪ C-EC(i) 9: Continue to monitor the impact of job growth in reducing unemployment and underemployment in the county. ▪ C-EC 3: Diversification in the mix of local industry should be encouraged in Santa Clara County to achieve a broader base of industrial and commercial activities in order to insulate the local economy from possible future economic downturns and to provide more lower skilled jobs
City of Santa Clara	
City of Santa Clara 2010–2035 General Plan (City of Santa Clara 2010)	The City of Santa Clara adopted the *City of Santa Clara 2010–2035 General Plan* in November 2010. The following goals and policies are relevant to the project: ▪ 5.3.1-P5 Implement a range of development densities and intensities within General Plan land use classification requirements to provide diversity, use land efficiently and meet population and employment growth. ▪ 5.3.1-P13 Support high density and intensity development within a quarter-mile of transit hubs and stations and along transit corridors. ▪ 5.3.2-P1 Encourage the annual construction of the housing units necessary to meet the City's regional housing needs assessment by reducing constraints to housing finance and development. Commercial Land Use Policies ▪ 5.3.3-P1 Provide a mix of retail and commercial uses to meet the needs of local customers and draw patrons from the greater region. ▪ 5.3.5-P1 Work with existing Santa Clara businesses to retain and expand employment opportunities and strengthen the existing tax base. ▪ 5.3.5-P2 Encourage existing businesses that may be displaced by new development to relocate within Santa Clara.
City of San Jose	
Envision San Jose 2040 General Plan (City of San Jose 2011)	The City of San Jose adopted the *Envision San Jose 2040 General Plan* in 2011. The following goals and policies are relevant to the project: ▪ IE-1.2: Plan for the retention and expansion of a strategic mix of employment activities at appropriate locations throughout the City to support a balanced economic base, including industrial suppliers and services, commercial/retail

Policy Title	Summary
	support services, clean technologies, life sciences, as well as high technology manufacturers and other related industries. ▪ IE-1.4: Manage land uses to enhance employment lands to improve the balance between jobs and workers residing in San José. Strive to achieve a minimum ratio of 1.3 jobs/employed resident to attain fiscal sustainability for the City. ▪ IE-1.5: Promote the intensification of employment activities on sites in close proximity to transit facilities and other existing infrastructure, in particular within the Downtown, North San José, the Berryessa International Business Park and Edenvale. ▪ Goal IE-2: Business Growth and Retention: Promote San José as an employment center. Nurture existing and attract new companies of all sizes (large anchor companies, emerging growth companies, small businesses) in industries that will drive the job and revenue growth for our City and regional economy. ▪ IE-2.5: Provide business assistance and support to facilitate job creation, develop new businesses, spur private investment, and promote industry growth. ▪ Goal IE-6: Broad Economic Prosperity: Provide widespread access to diverse employment and training opportunities in San José and strive to increase job growth, particularly jobs that provide self-sufficient wages and health care benefits, to allow the community to broadly share in the region's prosperity. ▪ FS-3.3: Promote land use policy and implementation actions that increase the ratio of Jobs to Employed Residents to improve our City's fiscal condition, consistent with economic development and land use goals and policies. Maintain or enhance the City's net total employment capacity collectively through amendments made to this General Plan in each Annual Review process. ▪ FS-3.13: Encourage other cities within the region to take on a greater share of the region's housing needs to promote an improved regional jobs-housing balance. ▪ LU-1.1: Foster development patterns that will achieve a complete community in San José, particularly with respect to increasing jobs and economic development and increasing the City's jobs-to-employed resident ratio while recognizing the importance of housing and a resident workforce. ▪ LU-2.1: Provide significant job and housing growth capacity within strategically identified "Growth Areas" in order to maximize use of existing or planned infrastructure (including fixed transit facilities), minimize the environmental impacts of new development, provide for more efficient delivery of City services, and foster the development of more vibrant, walkable urban settings. ▪ LU-2.2: Include within the Envision General Plan Land Use / Transportation Diagram significant job and housing growth capacity within the following identified Growth Areas: Downtown, Specific Plan Areas, North San José, Employment Lands, Urban Villages: BART/Caltrain Station Areas, Urban Villages: Transit / Commercial Corridors, Urban Villages: Commercial Centers, and Urban Villages: Neighborhood Urban Villages ▪ LU-2.3: To support the intensification of identified Growth Areas, and to achieve the various goals related to their development throughout the City, restrict new development on properties in non-Growth Areas.
City of Morgan Hill	
2035 General Plan (City of Morgan Hill 2016)	The City of Morgan Hill adopted the *2035 General Plan* in July 2016. The following goals and policies are relevant to the project: ▪ Policy CNF-2.1: Orderly Development. Promote the orderly development of the City, with concentric growth and infill of existing developed areas.

Policy Title	Summary
	▪ Policy CNF-2.2: A Balanced Community. Plan for the needs of all socioeconomic segments of the community, encouraging a balance and match in jobs and housing within the City. ▪ Policy CNF-2.4: Changing Demographics. When considering future urban development, look at least five to ten years into the future to take into account changing local and regional demographics. ▪ GOAL CNF-3: A growth management system that maintains a population cap, a metered pace of development, and high level of community amenities, and that is clear, fair, flexible, and streamlined. ▪ Policy CNF-3.5: Rate of Growth. Maintain steady and predictable annual growth consistent with the population limit. ▪ Policy CNF-3.7: Jobs/Housing Balance. Plan for residential growth that supports a healthy balance between residents and jobs located within Morgan Hill. ▪ Policy CNF-4.1: Future Growth Areas. Use the current Urban Service Area and Urban Growth Boundary to identify future urban development areas based on adequacy and availability of municipal services. ▪ Policy CNF-4.9: Orderly Growth. Urban growth should occur in an orderly and contiguous pattern, within the designated Urban Service Area, encouraging infill of vacant urban land. ▪ Policy CNF-10.1: Range of Residential Densities. Continue to provide for a full range of residential land use densities and building types, within the General Plan and Zoning Ordinance. ▪ GOAL CNF-21: Effective, stable growth of the South County. ▪ GOAL ED-1: High quality jobs for residents that support household incomes in line with local housing costs and higher-education institutions that enhance skills and increase access to high-quality education. ▪ Policy ED-1.2: Jobs/Housing Balance. Balance jobs and housing supplies to minimize traffic congestion, and commute times, and to optimize economic diversity and capacity to provide services. ▪ Policy HE-1a: Adequate Land for New Development. Ensure that an adequate amount of land is available for new residential development, zoned for a range of residential densities. ▪ Policy HE-1d: Variety of Housing. Encourage a variety of housing types and densities within the community.
City of Gilroy	
Gilroy 2020 General Plan (City of Gilroy 2002)	The City of Gilroy adopted the *Gilroy 2020 General Plan* in June 2002. The following goals and policies are relevant to the project: ▪ Policy 2.01: Location of Growth. Maximize existing infrastructure and service investments— and avoid premature investment for facility and service extensions—by directing new growth to vacant and under-utilized lands within the Urban Service Area. As a second-tier priority, direct new development to areas that border on existing urban development or are immediately adjacent to the Urban Service Area, prohibiting costly “leap frog” development and ensuring a compact development pattern. ▪ Policy 2.02: Rate and Timing of Growth. Ensure that the rate of growth is controlled such that resource and system capacity constraints are not exceeded (e.g., water supply and sewage treatment) and necessary urban services (such as sewer, water supply, police, and schools) are funded, implemented and completed prior to occupation of new buildings.

Policy Title	Summary
	▪ Policy 2.07: Urban Service Area. Establish and maintain an Urban Service Area that indicates the area of land that could potentially be developed in the next 5 years and to which the City is committed to providing basic infrastructure and services. ▪ Policy 2.08: 20-Year Boundary. Establish a "20-Year Boundary" and display it on the Land Use Plan Map, indicating the area of land that could potentially be developed in the next 20 years. ▪ Policy 3.01: Jobs and Revenues. Attract industrial, high-tech, and commercial office employers to provide a diversity of well-paid job opportunities for local residents and to broaden the City's revenue base, ensuring adequate resources over time to support the provision of quality city services. Also, support the development, retention, and expansion of small and medium size businesses, agricultural businesses, and tourism-related businesses, recognizing their vital importance to the City's economic future. ▪ Policy 3.02: Economic Development Activities. Actively promote Gilroy as a place for business and industry, capitalizing on the City's location and numerous amenities, to encourage new businesses to locate here and to retain existing businesses. ▪ Policy 3.04: Industrial Growth. Encourage new industrial uses to locate in Gilroy that can provide jobs for Gilroy residents. Discourage industrial uses that create noxious or nuisance conditions, as well as industries that would substantially fuel housing and population growth and place excessive burdens on public services, facilities, and schools. Phase new industrial development according to the availability of local housing, public facility capacities, and provision of urban services. ▪ Policy 3.25: Mix of Uses Downtown. Encourage a wide mix of uses in close proximity to each other in the Downtown area, including governmental services and facilities, cultural and recreational activities, a broad range of retail activities, financial and professional services, entertainment, transit services, and housing for residents. Encourage mixed use developments that integrate housing and commercial uses. ▪ Policy 3.26: Business Development in the Downtown. Provide amenities that will make Downtown attractive to office users and retail businesses (e.g., convenient parking, an attractive and safe environment, access to regional transit services, high quality infrastructure, reliable services, etc.) and encourage new office and retail businesses and expansions of existing businesses in Gilroy to locate there. ▪ Policy H-1.1: The City shall strive to ensure adequate land is available at a range of densities to meet Gilroy's existing and projected housing needs.
San Benito County	
San Benito County 2035 General Plan (County of San Benito 2015)	San Benito County adopted the *San Benito County 2035 General Plan* in July 2015. The following goals and policies are relevant to the project: ▪ LU-1.2: Sustainable Development Patterns. The County shall promote compact, clustered development patterns that use land efficiently; reduce pollution and the expenditure of energy and other resources; and facilitate walking, bicycling, and transit use; and encourage employment centers and shopping areas to be proximate to residential areas to reduce vehicle trips. Such patterns would apply to infill development, unincorporated communities, and the New Community Study Areas. The County recognizes that the New Community Study Areas comprise locations that can promote such sustainable development. ▪ GOAL LU-5: To promote the development of regional, thoroughfare, and locally serving commercial uses at key opportunities sites in the unincorporated county.

Policy Title	Summary
	▪ GOAL LU-6: To promote the development of new industrial and employment uses in the unincorporated parts of the county that are compatible with surrounding land uses and meet the present and future needs of county residents. ▪ GOAL LU-8: To provide the option for New Communities to be considered as a way of accommodating planned growth in the unincorporated parts of San Benito County. ▪ GOAL ED-1: To sustain the long-term economic wellbeing of the county by promoting economic sustainability and diversification. ▪ ED-1.2: Jobs/Housing Balance. The County shall strive to improve the housing balance countywide by providing sufficient employment-based land uses. ▪ ED-2.1: Business Expansion. The County shall encourage local and regional businesses to expand their operations, increase their employment opportunities, and increase their competitiveness in the regional market. ▪ GOAL ED-4: To expand the county's wine and hospitality industries in order to ensure San Benito County becomes a regional leader in the wine industry and a premier tourist destination. ▪ HOU-2A: The County shall encourage and assist the construction of a variety of housing types with varying densities and prices, for both sales and rental that are affordable to all income groups, particularly very low income and special needs groups
Merced County	
2030 Merced County General Plan (County of Merced 2013)	Merced County adopted the *2030 Merced County General Plan* in December 2013. The following goals and policies are relevant to the project: ▪ Goal ED-1 Support and promote growth and diversification of the County's economy. ▪ Policy ED-1.8: Jobs/Housing Balance. Encourage all communities, and require new or expanded Community Plans, to include sufficient employment-based land uses to maintain a 1:1 jobs/housing balance. ▪ Goal ED-3: Support and promote the retention and expansion of existing businesses. ▪ Goal ED-4: Support and promote new business development and employment growth, including local-serving, high-technology, and sustainable businesses. ▪ Goal LU-1: Create a countywide land use pattern that enhances the integrity of both urban and rural areas by focusing urban growth towards existing or suitably located new communities. ▪ Policy LU-1.2: Rural Centers. Limit the amount of new growth within existing Rural Centers by allowing only agriculture-supporting residential and commercial uses. ▪ Policy LU-1.10: Orderly Community Growth. Require the orderly, well planned, and balanced growth of the unincorporated communities consistent with the limits imposed by local infrastructure, services, public facilities, and their ability to assimilate growth. ▪ Policy LU-5.A.3: Growth Limitations. Limit growth in existing Urban Communities that lack public sewer and water systems to only include land use designations and densities which can be accommodated by individual septic systems and/or wells. ▪ Policy LU-5.A.5: Smart Growth. Promote the principles of smart growth in Community Plans for each Urban Community, including: a) creating safe, walkable neighborhoods; b) providing a mix of residential densities; c) creating a strong sense of place; d) mixing land uses; e) directing growth toward existing communities; f) building compactly; g) discouraging sprawl; h) encouraging infill; i)

Policy Title	Summary
	preserving open space; and j) creating a range of housing opportunities and choices. ▪ Policy LU-5.A.6: Jobs/Housing Balance. Promote a jobs/housing balance by encouraging residential development near employment centers when preparing new or updating existing Community Plans and providing adequate land for employment generating land use. ▪ Goal HE-1: To provide for a broad range of housing types and densities to meet the needs of all residents of the unincorporated area.

APPENDIX 2-K: POLICY CONSISTENCY ANALYSES

APPENDIX 2-K: POLICY CONSISTENCY ANALYSES

Since publication of the Draft Environmental Impact Report (EIR)/Environmental Impact Statement (EIS), the following substantive changes have been made to this appendix:

- This appendix was updated to provide additional consistency analysis with the Morgan Hill General Plan Transportation Element concerning several features of Alternative 2 in Table 1, Policy Inconsistency, Reconciliation, and Rationale for Transportation.
- This appendix was updated to include *Communications Hill Specific Plan Area Development Policy* (City of San Jose 2014) in Table 5, *Santa Clara Valley Agricultural Plan* (County of Santa Clara and Santa Clara Valley Open Space Authority 2018) in Table 7, and *Envision: San José 2040 General Plan* (City of San Jose 2011) in Table 9.
- SO-MM#1 and SO-MM#2 were removed from Table 5.

The California High-Speed Rail Authority (Authority) is a state agency and therefore is not required to comply with local land use and zoning regulations, however it has endeavored to design and construct the San Francisco to San Jose Project Section (Project Section) so that it is as compatible as possible with land use and zoning regulations. The Council on Environmental Quality (CEQ) and Federal Railroad Administration (FRA) regulations require the discussion of any inconsistency or conflict of a proposed action with regional or local plans and laws. Where inconsistencies or conflicts exist, the CEQ and FRA require a description of the extent of reconciliation and the reason for proceeding if full reconciliation is not feasible (40 C.F.R. § 1506.2(d) and 64 Fed. Reg. 28545, 14(n)(15)). California Environmental Quality Act (CEQA) Guidelines also require that an environmental impact report discuss the inconsistencies between the proposed project and applicable general plans, specific plans, and regional plans (CEQA Guidelines § 15125(d)).

Although the *San Jose to Merced Project Section Environmental Impact Report (EIR)/Environmental Impact Statement (EIS)* (EIR/EIS) describes the Project Section's inconsistency with local plans in order to provide a context for the project, inconsistency with such plans is not considered an environmental impact.

This appendix provides the following for each resource with identified policy inconsistencies:

- A statement for each policy that the Project Section is inconsistent with, and an explanation of any inconsistencies.
- A discussion of reconciliation approaches the Authority has committed to take to reconcile any inconsistency. These consist of impact avoidance and minimization features and mitigation measures (described in Volume 2, Appendix 2-E, Project Impact Avoidance and Minimization Features) and activities described in Appendix 2-D, Applicable Design Standards.
- The rationale for carrying forth the Project Section if it remains inconsistent with the policy despite these approaches.

Transportation

Table 1 Policy Inconsistency, Reconciliation, and Rationale for Transportation

Policy	Description of Inconsistency	Reconciliation	Rationale
Santa Clara County General Plan (1994)			
Policy C-TR 12: It is the goal of this plan to achieve a LOS no lower than D at peak travel periods on city streets, county roads, expressways and state highways. However, in certain instances, a lower level of service may be acceptable when LOS D cannot practically be achieved.	Inconsistent. The project would cause some intersections under County jurisdiction to operate at worse than LOS of D or better, resulting in an inconsistency with the County's LOS policy.	While the project includes features to implement level of service mitigations, the project will remain inconsistent. Not reconciled.	While the project would degrade intersection LOS at some locations, the Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes features to minimize level of service degradation.
City of San Jose General Plan (2011)			
Policy TR-5.3: The minimum overall roadway performance during peak travel periods should be level of service "D" except for designated areas.	Inconsistent. The project would cause some intersections under City jurisdiction to operate at worse than the target LOS of D or better, resulting in an inconsistency with the City's LOS policy.	While the project includes features to implement level of service mitigations, the project will remain inconsistent. Not reconciled.	While the project would degrade intersection LOS at some locations, the Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes features to minimize level of service degradation.

Policy	Description of Inconsistency	Reconciliation	Rationale
City of Morgan Hill General Plan (2016)			
Policy TR-3.4. As the LOS Policy and design criteria for roadway improvements, use a Tiered LOS Standard as follows: ○ LOS F in the Downtown at Main/Monterey, along Monterey Road between Main and Fifth Street, and along Depot Street at First through Fifth Streets [...] ○ LOS D for intersections and segments elsewhere; except [for] LOS E for identified freeway ramps/zones, road segments and intersections that (1) provide a transition to and are located on the periphery of downtown; (2) are freeway zone intersections; and/or (3) where achieving LOS D could result in interim intersection improvements which would be "over-built" once the city's circulation network has been completed, and/or would involve unacceptable impacts [. . .]	Inconsistent. The project would cause some intersections under City jurisdiction to operate at worse than the target LOS of D or better, resulting in an inconsistency with the City's LOS policy.	While the project includes features to implement level of service mitigations, the project will remain inconsistent. Not reconciled.	While the project would degrade intersection LOS at some locations, the Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes features to minimize level of service degradation.
The Transportation Element shows the future circulation system for the City, including planned 2035 improvements. The Transportation Element shows an extension of Madrone Parkway across the railroad, Monterey Road, to Hale Avenue. The Transportation Element also shows maintaining a connection of Tilton Ave. to Monterey Road. The Transportation Element also states the following: "While not analyzed or included in the Circulation Plan for 2030, future consideration should be given to extending Butterfield north of Madrone to connect to Burnett Avenue, perhaps then curving northwest to connect to Tilton Avenue."	Partially Inconsistent. According to the City, they are planning to amend the General Plan in the future to show a grade separation and connections of Burnett Avenue and Tilton Avenue and eliminate the grade separation and extension of Madrone Parkway through to Hale Avenue, but, as of October 2020, that amendment had not yet been realized. Consequently, Alternative 2 is not inconsistent with the currently adopted General Plan Transportation Element in regard to Madrone Parkway but is inconsistent in regard to Tilton Avenue, which is designed in Alternative 2 to be a cul-de-sac.	Due to the realignment of Monterey Road with Alternative 2, there is insufficient space to connect Monterey Road and Tilton Avenue.	No resolution due to space limitations.
City of Gilroy General Plan (2002)			

Policy	Description of Inconsistency	Reconciliation	Rationale
Policy 12.08 Standard LOS. Maintain traffic conditions at LOS C or better at Gilroy intersections and roadways, allowing some commercial and industrial areas to operate at LOS D or better. Exceptions to this standard will be allowed only where the City Council determines that the improvements needed to maintain the City's standard level of service at specific locations are infeasible.	Inconsistent. The project would cause some intersections under City jurisdiction to operate at worse than the target LOS of D or better, resulting in an inconsistency with the City's LOS policy.	While the project includes features to implement level of service mitigations, the project will remain inconsistent. Not reconciled.	While the project would degrade intersection LOS at some locations, the Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes features to minimize level of service degradation.

Sources: City of Gilroy 2002; City of Morgan Hill 2016; City of San Jose 2011; County of Santa Clara 1994.
LOS = level-of-service
HSR = high-speed rail
Authority = California High-Speed Rail Authority

Air Quality and Greenhouse Gases

Table 2 Policy Consistency or Inconsistency, Reconciliation, and Rationale

Policy	Consistent or Inconsistent	Reconciliation	Rationale
Plan Bay Area 2040 (2017)			
Target#3: Reduce adverse health impacts associated with air quality, road safety, and physical inactivity by 10%.	Inconsistent During construction, the project would result in temporary emissions of criteria pollutants that could increase temporary health risks in the vicinity of existing communities.	AQ-IAMF#1 and AQ-IAMF#2 would minimize emissions of fugitive dust and off-gassing emissions of VOCs from paints and other coatings. AQ-IAMF#3 through AQ-IAMF#6 would reduce and minimize impacts by requiring the use of renewable diesel and the cleanest reasonably available equipment and control measures to limit criteria pollutant emissions from construction equipment, vehicles, and concrete batch plants. Despite these onsite controls, all project alternatives would result in temporary violations of the NAAQS and CAAQS, which have been established to protect public health. Therefore, the project would remain inconsistent.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The Authority has incorporated IAMFs into the project to minimize impacts on air quality and public health.

Sources: ABAG and MTC 2017.
NAAQS = national ambient air quality standards
CAAQS = California ambient air quality standards
Authority = California High-Speed Rail Authority
IAMF = impact avoidance and minimization feature

Noise and Vibration

Table 3 Policy Inconsistency, Reconciliation, and Rationale for Noise and Vibration

Policy	Description of Inconsistency	Reconciliation	Rationale
Santa Clara County General Plan (1994)			
Noise Compatibility for Land Use in Santa Clara County, page P-5	Project implementation would result in noise environments that exceed 70 L_{dn} which is *Critical* for all noise-sensitive land use	This is applicable to all similar inconsistencies with Land Use Compatibility. The project would incorporate NV-MM#3 to minimize operations noise impacts, and it would consider the following: construct noise barriers, support City implementation of Quiet Zones where cities decide to implement them, install sound insulation, or acquire easements on properties severely affected by noise. These determinations would be based on criteria in the Authority's Noise and Vibration Mitigation Guidelines (Volume 2, Appendix 3.4-B). These measures would reduce or compensate for severe noise impacts from operations. NV-MM#4 requires HSR vehicles to meet federal regulations for noise (40 C.F.R. Part 201.12) at the time of procurement. NV-MM#5 requires the contractor to document how they minimized or eliminated rail gaps related to special trackwork, which can be a major source of noise during operations. NV-MM#6, requires final design noise measures. These mitigation measures would all be effective at reducing the number of severe noise impacts in the RSA; however, they would not mitigate all noise impacts. NV-MM#4 would help to avoid or reduce train horn noise impacts near at-grade crossings with regional implementation of grade separations, but funding is not assured for this mitigation and thus its implementation is uncertain. Thus, there are locations where it is not technically feasible to meet the noise limits.	This is applicable to all similar inconsistencies with Land Use Compatibility. Although mitigation measures would be able to reduce project noise levels, they would not reduce all levels to the standards for residential, commercial, and institutional land uses due to the limitations in noise barrier cost effectiveness, implementation (HSR cannot implement quiet zones; only local jurisdictions can), and funding (in regard to grade separations).

Policy	Description of Inconsistency	Reconciliation	Rationale
Santa Clara County Ordinance Code (2016)			
Construction hours No construction 7 pm to 7 am, weekdays. None allowed on Sundays and holidays	Project construction would occur at night and on weekends outside the hours in the code.	This is applicable to all similar inconsistencies with construction hours. The project would incorporate NV-IAMF#1 to minimize noise impacts by requiring compliance with FRA guidelines for minimizing construction noise and vibration impacts when work is conducted within 1,000 feet of sensitive receptors. The Authority would implement NV-MM#1 which would require the contractor to prepare a noise-monitoring program and noise control plan prior to construction to comply with the FRA construction noise limits wherever feasible. The monitoring program would describe the actions the contractor would use to reduce noise, such as installing temporary noise barriers, avoiding nighttime construction near residential areas, and using low-noise emission equipment.	This is applicable to all similar inconsistencies with construction hours. Construction would occur in a constrained operating rail corridor. Track work and some other work would need to be done at night to avoid disruption to Caltrain commuter rail operations and/or roadway operations. Thus, there are locations where it is not technically feasible to meet the noise limits.
City of Santa Clara 2010-2035 General Plan (2010)			
General Plan Noise Standards, Table 8.14-1	Project implementation would result in noise environments that exceed 70 L_{dn} which Requires Design and insulation for residential land use/FRA Category 2 and schools and churches, etc./FRA Category 3) or 73 L_{dn} which is *Incompatible* for residential land use/FRA Category 2 and schools and churches, etc./FRA Category 3. At institutional and commercial land use/FRA Category 3, project implementation would result in noise environments that exceed 75 L_{dn}/CNEL which requires design and insulation.	This reconciliation is the same as already noted above for Land Use Compatibility.	This rationale is the same as already noted above for Land Use Compatibility

Policy	Description of Inconsistency	Reconciliation	Rationale
Envision San Jose 2040 General Plan (2011)			
Land Use Compatibility Guidelines for Community Noise in San Jose, Table 4	Project implementation would result in noise environments that exceed 70 L_{dn} which requires acoustical analysis for residential land use/FRA Category 2 and schools and churches, etc./FRA Category 3. At institutional and commercial land use/FRA Category 3, project implementation would result in noise environments that exceed 77 L_{dn} which requires acoustical analysis.	This reconciliation is the same as already noted above for Land Use Compatibility.	This reconciliation is the same as already noted above for Land Use Compatibility
Morgan Hill 2035 General Plan (2016)			
State of California Land Use Compatibility Guidelines for Community Noise Environments, Table SSI-1	Project implementation would result in noise environments that exceed 70 CNEL which is *Normally Unacceptable* for residential land use/FRA Category 2 and schools and churches, etc./FRA Category 3, or 75 CNEL which is *Clearly Unacceptable* for residential land use/FRA Category 2 and schools and churches, etc./FRA Category 3. At office and commercial land use/FRA Category 3, project implementation would result in noise environments that exceed 75 CNEL which is *Normally Unacceptable.*	This reconciliation is the same as already noted above for Land Use Compatibility.	This rationale is the same as already noted above for Land Use Compatibility
Morgan Hill Municipal Code (2017)			
Section 8.28.040 Construction hours limited to 7 am – 8 pm M-F and 9 am – 6 pm Saturday Not allowed Sundays and holidays	Project construction would occur at night and on weekends outside the hours in the code.	This reconciliation is the same as already noted above for construction hours.	This rationale is the same as already noted above for construction hours.

Policy	Description of Inconsistency	Reconciliation	Rationale
The City of Gilroy 2002-2020 General Plan (2002)			
Permissible (sic) Maximum Outdoor and indoor Noise Levels, Figure 8-3	Project implementation would result in noise environments that exceed the City's 70 L_{dn} maximum for residential land use with sound attenuation measures in place. At commercial land use/FRA Category 3, project implementation would result in noise environments that exceed the City's maximum 65 L_{dn}.	This reconciliation is the same as already noted above for Land Use Compatibility.	This rationale is the same as already noted above for Land Use Compatibility
Gilroy Municipal Code (2017)			
Chapter 16 offences, 16.38 construction allowed 7 am – 7 pm M-F and 9 am – 7 pm Sat None allowed Sundays and holidays	Project construction would occur at night and on weekends outside the hours in the code.	This reconciliation is the same as already noted above for construction hours.	This rationale is the same as already noted above for construction hours.
San Benito County 2035 General Plan (2015)			
HS-8.3 construction Allowed 7 am -6 pm M-F and 8 am – 5 pm Saturday. Not allowed Sunday and holidays	Project construction would occur at night and on weekends outside the hours in the code.	This reconciliation is the same as already noted above for construction hours.	This rationale is the same as already noted above for construction hours.
2030 Merced County General Plan (2013)			
HS-7.9 Transportation Project, Policy HS-7.9 Significance thresholds are based on increase over existing: for existing <60 L_{dn} an increase over 5 dB would be significant; for existing >65 L_{dn}, an increase of more than 1.5 dB would be significant; for existing 60-65 L_{dn}, an	Project implementation would result in noise increases that would be up to 23 dBA where the existing noise level is less than 60 L_{dn}, 12.5 dBA where the existing noise level is 60 to 65 L_{dn} and 8.1 dBA where the existing noise level is greater than 65 L_{dn}. These increases would be significant per Merced County General Plan.	The project would incorporate NV-MM#3 to minimize operations noise impacts, and it would consider the following: construct noise barriers, support City implementation of Quiet Zones where cities decide to implement them, install sound insulation, or acquire easements on properties severely affected by noise. These determinations would be based on criteria in the Authority's Noise and Vibration Mitigation Guidelines (Volume 2, Appendix 3.4-B). These measures would reduce or compensate for severe noise impacts from operations. NV-MM#4 requires HSR vehicles to meet federal regulations for noise (40 C.F.R. Part 201.12) at	Although mitigation measures would be able to reduce project noise levels, they would not reduce all levels to the standards for residential, commercial, and institutional land uses due to the limitations in noise barrier cost effectiveness, implementation (HSR cannot implement quiet zones; only local jurisdictions can), and funding (in regard to grade separations).

Policy	Description of Inconsistency	Reconciliation	Rationale
increase more than 3 dB would be significant.		the time of procurement. NV-MM#5 requires the contractor to document how they minimized or eliminated rail gaps related to special trackwork, which can be a major source of noise during operations. NV-MM#6, requires final design noise measures. These mitigation measures would all be effective at reducing the number of severe noise impacts in the RSA; however, they would not mitigate all noise impacts. TR-MM#2 would help to avoid or reduce train horn noise impacts near at-grade crossings with regional implementation of grade separations, but funding is not assured for this mitigation and thus its implementation is uncertain. Thus, there are locations where it is not technically feasible to meet the noise limits.	
Land Use Compatibility, Figure 10.1	Project implementation would result in noise environments that exceed 70 Ldn which is *Normally Unacceptable* for residential land use/FRA Category 2 and schools and churches, etc./FRA Category 3, or 75 Ldn which is *Clearly Unacceptable* for residential land use.	This reconciliation is the same as already noted above for Land Use Compatibility.	This rationale is the same as already noted above for Land Use Compatibility.
Merced County Ordinance Code (2016)			
10.60.030 sound level limit Construction hours allowed 7 am to 6 pm	Project construction would occur at night and on weekends outside the hours in the code.	This reconciliation is the same as already noted above for construction hours.	This rationale is the same as already noted above for construction hours.

Sources: City of Gilroy 2002; City of Morgan Hill 2016; City of San Jose 2011; City of Santa Clara 2010; County of Merced 2013; County of San Benito 2015; County of Santa Clara 1994.

Hydrology and Water Resources

Table 4 Policy Inconsistency, Reconciliation, and Rationale for Hydrology and Water Resources

Policy	Description of Inconsistency	Reconciliation	Rationale
City of Morgan Hill General Plan (2016)			
Policy NRE-8.6: Protect properties located in areas that have soils with rapid water percolation from future development in order to ensure existing water quality. Permit development (including commercial and industrial uses) in such areas only under strict safety limitations according to the City's Hazardous Materials Storage Ordinance section specifically related to high percolation rates.	Inconsistent. The project extent is located within groundwater recharge areas and other areas with rapid percolation along the foothills of the Coast Ranges and Diablo Range; such areas are susceptible to contamination from hazardous waste.	A spill prevention, control, and countermeasure plan would control and minimize potential groundwater contamination during construction (HMW-IAMF#6). An Environmental Management System would be developed to identify and promote the use nonhazardous materials (HMW-IAMF#9), which reduce the potential effects of a leak or spill. A hazardous materials and waste plan would be prepared that describes responsible parties and procedures for hazardous waste and the transport of hazardous materials on public roadways (HMW-IAMF#7). Stations and maintenance facilities would be designed to minimize the exposure of pollutants to runoff in accordance with the Phase II MS4 permit. Stations and maintenance facilities would operate under a SWPPP in compliance with the IGP to further minimize potential groundwater quality impacts (HYD-IAMF#4).	While the project extent would develop portions of groundwater recharge areas in the Coyote Valley, which are susceptible to groundwater contamination, project features would minimize potential impacts on groundwater quality.
City of Gilroy General Plan (2002)			
Policy 25.18: Restrict urban development and expansion in areas prone to flooding (as indicated on the Flood Hazards Map) or on properties where drainage problems or saturated soil conditions create flood hazards. Allow development in such areas only if measures are enacted to reduce these hazards to an acceptable level of risk.	Inconsistent. The project extent would include development within areas susceptible to flood hazards within Gilroy, including the construction of viaducts and a maintenance of way facility in the Soap Lake floodplain.	Although the project extent would include development in floodplains, a Flood Protection Plan would be prepared to establish procedures and design features so that the project extent remains operational during the 100-year flood. In addition, the Flood Protection Plan would minimize impacts on the 100-year profiles, footprints, and peak flows of floodplains and floodways, including the Soap Lake floodplain (HYD-IAMF#2).	The project extent would include development within floodplains in Gilroy, because the proposed alignment crosses numerous low-lying areas susceptible to flooding. Project features would minimize potential effects of development in floodplains with a Flood Protection Plan.

Policy	Description of Inconsistency	Reconciliation	Rationale
The Santa Clara Valley Greenprint (2014)			
Strategy 1b: Advocate policies and use land protection measures that prevent urban development in groundwater recharge areas, particularly the Coyote Valley.	Inconsistent. The project extent includes development in groundwater recharge areas in the Coyote Valley.	Although the project extent would include development in groundwater recharge areas, the proposed development would be a small percentage of the overall recharge area. A Stormwater Management and Treatment Plan would include BMPs, such as infiltration BMPs, that would facilitate the percolation of runoff from impervious surfaces (HYD-IAMF#1).	While the project extent would entail development in portions of groundwater recharge areas in the Coyote Valley, project features have been incorporated to minimize impacts on groundwater recharge, including compliance with the Phase II MS4 permit, which requires infiltration BMPs within the southern portion of the Coyote Valley.
Strategy 4a: Ensure that leases and management agreements for the Santa Clara Valley Open Space Authority's agricultural tenants are written to protect water resources from depletion, pollution, development, and fire, including promotion of organic operations to limit the use of pesticides and fertilizers.	Inconsistent. Constructing the project extent would require the relocation or modification of existing irrigation and drainage features in agricultural lands, potentially resulting in the degradation of water resources.	Modifying and realigning jurisdictional features would be conducted in compliance with conditions in permits issued by regulatory agencies. During construction, a SWPPP would be implemented under the county general plan to avoid or minimize the discharge of sediment and pollutants to water resources, such as irrigation facilities and drainage features (HYD-IAMF#3). An Annual Vegetation Management Plan would be prepared to avoid or minimize discharges of pesticides during operations.	While construction of the project extent would require the modification and realignment of waterbodies, numerous IAMFs have been incorporated into the project to prevent the degradation and pollution of water resources in the Santa Clara Valley.

Sources: City of Gilroy 2002; City of Morgan Hill 2016; Santa Clara Valley Open Space Authority 2014.

Socioeconomics and Communities

Table 5 Policy Inconsistency, Reconciliation, and Rationale for Socioeconomics and Communities

Policy	Description of Inconsistency	Reconciliation	Rationale
Santa Clara County General Plan (1994, 2014)			
Policy HG 21. The conservation and rehabilitation of the existing housing supply shall be encouraged and facilitated.	Inconsistent The project extent would require the acquisition of land within the project footprint, result in the demolition of some existing residences that could widen existing community divisions, affect social relationships, and alter the existing character and integrity of the communities through which it passes. Project features and compliance with the Uniform Act would minimize the impacts on existing housing stock by providing relocation assistance for displaced residents. Mitigation measures would partially reduce these impacts; however, some existing housing and businesses would be permanently removed.	The Authority and FRA would work with local governments to enhance the public benefits of HSR development so that they help meet the needs of the local communities, including housing. The Authority must comply with the Uniform Relocation Assistance and Real Property Acquisition Policies Act, as amended (Uniform Act), as identified in SOCIO-IAMF#2. ^ Despite implementation of ^ design features, the project would remain inconsistent. Not reconciled.	While the project extent would convert residential land uses to transportation and industrial uses, the Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes features to minimize division of communities and reduction of housing stock.
Envision: San Jose 2040 General Plan (2011) and 2014–23 Housing Element (2015)			
Policy H-2.3. Conserve viable housing stock through a balanced combination of housing code enforcement and complementary programs such as rehabilitation loans and grants to help maintain the supply of low-priced housing. Policy H-3.4. Promote the conservation and rehabilitation of existing viable housing stock.	Inconsistent The project extent would require the acquisition of land within the project footprint, result in the demolition of some existing residences that could widen existing community divisions, affect social relationships, and alter the existing character and integrity of the communities through which it passes. Project features would minimize the impacts on existing housing stock by providing replacement housing.	The Authority and FRA would work with local governments to enhance the public benefits of HSR development so that they help meet the needs of the local communities, including housing. The Authority must comply with the Uniform Act, as amended, as identified in SOCIO-IAMF#2. ^ Despite implementation of ^ design features, the project would remain inconsistent. Not reconciled.	While the project extent would convert residential land uses to transportation and industrial uses, the Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes features to minimize division of communities and reduction of housing stock.

Policy	Description of Inconsistency	Reconciliation	Rationale
	Mitigation measures would partially reduce these impacts; however, some existing housing and businesses would be permanently removed.		
Communications Hill Specific Plan (1992)			
Adopt site planning and architectural guidelines and noise attenuation techniques to protect Communications Hill residents and workers from excessive noise from arterials, freeways, the fairground activities, adjacent industrial activities and trains and planes traveling nearby.	Inconsistent The project extent would introduce new sources of noise and vibration and could widen existing community divisions and affect social relationships. Project features would minimize the effects of noise and vibration through specific design features such as noise barriers and enclosed viaduct. Mitigation measures would partially reduce these impacts; however, some increased noise would be unavoidable.	The Authority and FRA would work with local governments to enhance the public benefits of HSR development so that they help meet the needs of the local communities. The project includes NV-IAMF#1, Noise and Vibration, which requires that FTA and FRA guidelines for minimizing noise and vibration effects at sensitive receptors would be followed during construction and would minimize the effects of construction noise and vibration on communities. While the project includes this feature to implement urban design guidelines, the project would remain inconsistent. Not reconciled.	While the project extent would result in increased noise and vibration to sensitive receptors, the Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes features to minimize increased noise and vibration.
Communications Hill Specific Plan Area Development Policy (2014)			
ADP Improvement 8: Capitol Caltrain Station Pedestrian/Bicycle Connection along Monterey Highway. Access from the Communications Hill 2 project site to the Capitol Caltrain Station on the east side of the railroad tracks adjacent to Monterey Road can be acquired by way of three options. These options were developed because property would need to be obtained from private property owners. Option #1 assumes the crossing would located north of the existing Capitol Caltrain Station. The overcrossing location for	Project Alternatives would introduce new tracks, permanent structures, and temporary construction staging where the policy proposes trail and crossing options. Option #1 would be consistent with Alternatives 1 through 4. The proposed trail would pass under the viaducts in Alternatives 1-3. For all alternatives, the crossing would pass over or under the Caltrain and blended corridor.	Conversion of the overcrossing in Option #2 and #3 to an undercrossing would make Option #2 and #3 consistent with Alternatives 1 through 3.	None of the project Alternatives would preclude construction of a pedestrian and bicycle overcrossing at Capitol Caltrain Station. All options proposed in ADP Improvement 8 remain feasible.

Policy	Description of Inconsistency	Reconciliation	Rationale
Options #2 and #3 would be approximately the same; adjacent to or very near the existing Station. The design of the crossing itself would be the same regardless of the access location. These options are generally described below and shown on Figure 2. Option #1 Alignment • Construct approximately 400 linear feet of sidewalk or pathway from the project site to the western landing of the future overcrossing to be located north of the existing Capitol Caltrain Station. • Construct a pedestrian/bicycle overcrossing between the end of the sidewalk/pathway and the existing sidewalk on the east side of the railroad tracks. The sidewalk on the east side of the railroad tracks along Monterey Road would be utilized to access the Station. • Requires right-of-way (easement) from at least one private property owner. • Requires coordination/permit from the Joint Powers Board Option #2 Alignment • Construct approximately 1,200 linear feet of pathway or trail from the project site to the western landing of the overcrossing to the Caltrain Station. A portion of this trail would run along the east side of the railroad tracks.	Option #2 would be consistent with Alternative 4 and inconsistent with Alternatives 1 through 3 as an over crossing would require a substantial increase in crossing height with the construction of the viaduct. Option #3 would be inconsistent with Alternatives 1 through 3 as an over crossing would require a substantial increase in crossing height with the construction of the viaduct. Option #3 would be consistent with Alternative 4 as the Option #3 overcrossing could connect to the overcrossing included in the Alternative 4 Capitol Caltrain Station design.		

Policy	Description of Inconsistency	Reconciliation	Rationale
• Construct a pedestrian/bicycle overcrossing between the end of the pathway/trail and the Station. • Requires easement from at least two private property owners. • Requires coordination/permit from the Joint Powers Board. Option #3 Alignment Utilize existing public streets and sidewalks south of the project site to the extent possible to access the future overcrossing. This would require the construction of approximately 2,200 linear feet of new sidewalks from the project site along Hillcap and Hillsdale Avenues and Granite Rock Way. At the terminus of Granite Rock Way, an approximately 400-foot long pathway/trail would be constructed to the western landing of the overcrossing. Construct a pedestrian/bicycle overcrossing between the end of the pathway/trail and the Station.			
Morgan Hill 2035 General Plan (2016) and 2015–2023 Housing Element Update (2015)			
Policy CNF-2.3. Quality of life. Maintain Morgan Hill's high quality of life for existing and future residents. Policy CNF-11.1. Preservation of Single-Family Neighborhoods. Encourage preservation and rehabilitation of single-family neighborhoods within the City. Policy CNF-15.6. Preservation of Homes Along Monterey Road. Encourage preservation of older homes along	Inconsistent The project extent would require the acquisition of land within the project footprint and result in the demolition of some existing residences and commercial and industrial properties that could widen existing community divisions, affect social relationships, reduce the quality of life for residents, and alter the existing character and integrity of the communities through which it passes. Some agricultural land	The Authority and FRA would work with local governments to enhance the public benefits of HSR development so that they help meet the needs of the local communities: Numerous project features and mitigation measures have been incorporated to reduce effects on communities from emissions, noise and vibration, risks to community security and safety, degradation of visual quality, and disruption of circulation and access on communities. The Authority will comply	While the project extent would convert residential, commercial and public facilities to transportation and industrial uses, the Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes features to minimize division of communities, reduction of housing stock, and increased noise and vibration.

Policy	Description of Inconsistency	Reconciliation	Rationale
Monterey Road north of Central Avenue for commercial and office use. Policy CNF-17.1. Industrial Land Conversion. Discourage the conversion of property designated for industrial to non-industrial uses. Policy CNF-17.4. Property between Monterey Road and UPRR Tracks. Allow a mix of uses on the property located on the east side of Monterey Road south of the Union Pacific train trestle. Require designs for new development to recognize the significance of this portion of Monterey Road as the northerly entrance to downtown and the necessary limitations on use due to its single point of access. Policy ED-3.1. Business Retention, Expansion, and Attraction Efforts. Encourage retention and expansion of existing businesses, and attract new businesses. Policy ED-3.2. Employment Land Supply. Preserve the City's supply of industrial and commercial lands to support the City's goals and policies related to economic development and jobs-housing balance. Policy NRE-4.1. Agriculture Retention and Transition to Urban Uses. Support programs and techniques, including conservation easements and purchase of development rights to encourage the retention of agricultural activities and to minimize conflicts in the transition from agriculture to urban uses	would be displaced that could result in reduced agricultural production revenues. Project features and compliance with the Uniform Act would minimize the impacts on existing housing stock, commercial and industrial properties, agricultural facilities, and community and public facilities by maintaining access during project extent construction and operation, and offering relocation assistance. Mitigation measures would partially reconcile these impacts; however, some existing housing, commercial and industrial properties, and agricultural land would be permanently removed.	with the Uniform Act to provide relocation assistance for residents, businesses, agricultural properties, and community and public facilities. Despite implementation of project features and mitigation measures, the project would remain inconsistent. Not reconciled.	

Policy	Description of Inconsistency	Reconciliation	Rationale
Policy NRE-4.9. Urban Encroachment. Require new urban development adjacent to an existing agricultural operation to create an appropriate buffer area, on land within the proposed development, between urban uses and agricultural activities. Policy NRE-4.10. Land Use to Support Agricultural Viability. Maintain the economic viability of agriculture using a variety of methods.			
Policy SSI-8.1. Exterior Noise Level Standards. Require new development projects to be designed and constructed to meet acceptable exterior noise level standards.	Inconsistent The project extent would introduce new sources of noise and vibration that could widen existing community divisions, affect social relationships, reduce the quality of life for residents, and alter the existing character and integrity of the communities through which it passes. Project features would minimize the impacts from noise and vibration. Mitigation measures would partially reduce these impacts; however, some severe noise effects would remain.	The Authority and FRA would work with local governments to enhance the public benefits of HSR development so that they help meet the needs of the local communities. The project includes features to minimize noise (NV-IAMF#1) to the maximum extent feasible. While the project includes this feature to implement urban design guidelines, the project would remain inconsistent. Not reconciled.	While the project extent would result in increased noise and vibration to sensitive receptors, the Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes features to minimize increased noise and vibration.
Downtown Morgan Hill Specific Plan (2009)			
Encourage the preservation of the small-scale residential neighborhoods west of Monterey Road and north of Fourth Street.	Inconsistent The East of UPRR design option under Alternative 2 would travel through these neighborhoods and would require the acquisition of land within the project footprint, introduce new sources of noise and vibration, and result in the demolition of some existing residences that could widen existing community divisions, affect social relationships, reduce the quality of life for residents, and alter the	The Authority and FRA would work with local governments to enhance the public benefits of HSR development so that they help meet the needs of the local communities. Numerous project features have been incorporated to minimize effects on communities, including housing. While the project includes these features, the project would remain inconsistent. Not reconciled.	While the project extent would convert residential land uses to transportation and industrial uses, the Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes features to minimize division of communities and reduction of housing stock.

Policy	Description of Inconsistency	Reconciliation	Rationale
	existing character and integrity of the communities through which it passes. Project features and compliance with the Uniform Act would minimize the impacts on existing housing stock by providing by providing relocation assistance for displaced residents and would minimize the impacts from noise and vibration and changes in visual character. Mitigation measures would partially reduce these impacts; however, some existing housing and businesses would be permanently removed, some increased noise would be unavoidable, and there would be a change in the existing visual environment.		
City of Gilroy 2020 General Plan (2002) and 2015-23 Housing Element (2014)			
Policy 4.01. Economic Viability of Agriculture. Support the long-term economic viability of agriculture and agri-tourism, thereby encouraging landowners to keep their land in cultivation. Policy 4.02, Agricultural Land Preservation. Work with the County, LAFCo, and other relevant agencies as well as private landowners to protect agricultural and grazing lands from encroachment by urban uses, and to encourage the use of such lands for active cultivation. Specifically, implement the strategies and actions recommended by the South County Agricultural Study (Strategies to Balance Planned Growth and Agricultural Viability in the Areas South and East of Gilroy, October 1996).	Inconsistent The project extent would require the acquisition of agricultural land within the project footprint that could result in reduced agricultural production revenues. Project features would minimize the impacts on existing housing stock and agricultural facilities by maintaining access for agricultural operations during construction and operation, and offering relocation assistance. Mitigation measures would partially reduce these impacts; however, some existing agricultural land would be permanently removed.	The Authority and FRA would work with local governments to enhance the public benefits of HSR development so that they help meet the needs of the local communities: Numerous project features have been incorporated to minimize effects on communities, including agricultural properties. While the project includes these features, the project would remain inconsistent. Not reconciled.	While the project extent would convert farmland to transportation and industrial uses, the Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes features to minimize effects on agricultural properties.

Policy	Description of Inconsistency	Reconciliation	Rationale
Santa Benito County 2035 General Plan (2015)			
Policy LU-3.2 Agricultural Integrity and Flexibility. The County shall protect the integrity of existing agricultural resources, and provide for flexibility and economic viability of farming and ranching operations. Policy NCR-1.1 Maintenance of Open Space. The County shall support and encourage maintenance of open space lands that support natural resources, agricultural resources, recreation, tribal resources, wildlife habitat, water management, scenic quality, and other beneficial uses.	Inconsistent The project extent would reduce the amount of land available for agricultural production. The project extent would introduce a large visual element into the existing rural landscape that would alter the rural character and natural beauty of the area. The project extent would also result in displacements of farm residences, acquisition of agricultural parcels, and splitting of some agricultural parcels along the alignment, resulting in the conversion of agricultural land, conflicts with the overall aim of the general plan policies, and short-term economic impacts. Project features and mitigation measures would reduce economic impacts, and compensation would be distributed on a case-by-case basis for split parcels. The project extent would result in overall economic benefits and facilitate regional economic expansion.	The Authority and FRA would work with local governments to enhance the public benefits of HSR development so that they help meet the needs of the local communities. Numerous project features have been incorporated to minimize effects on communities, including agricultural properties and open space. While the project includes these features, the project would remain inconsistent. Not reconciled.	While the project extent would convert farmland and open space to transportation and industrial uses, the Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes features to minimize effects on agricultural properties and open space.
2030 Merced County General Plan (2013)			
Policy AG-2.2. Agricultural Land Mitigation (RDR) Protect productive agricultural areas from conversion to non-agricultural residential uses by establishing and implementing an agricultural mitigation program that matches acres converted with farmland acres of similar quality to those converted preserved at a 1:1 ratio. Coordinate with the six cities in Merced County and the Merced Local Agency Formation Commission (LAFCo), consistent with	Inconsistent The project extent would reduce the amount of land available for agricultural production. The project extent would also result in displacements of farm residences, acquisition of agricultural parcels, and splitting of some agricultural parcels along the alignment, resulting in the conversion of agricultural land, conflicts with the overall aim of the general plan policies, and short-term	The Authority and FRA would work with local governments to enhance the public benefits of HSR development so that they help meet the needs of the local communities. Numerous project features have been incorporated to minimize effects on communities, including agricultural properties. While the project includes these features, the project would remain inconsistent. Not reconciled.	While the project extent would convert farmland to transportation and industrial uses, the Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes features to minimize effects on agricultural properties.

Policy	Description of Inconsistency	Reconciliation	Rationale
LAFCo's statutory mission to preserve agricultural land and open space, to establish consistent standards and mitigation for the loss of farmland. In addition, the Land Evaluation and Site Assessment Model (LESA model) may be used to determine whether the conservation land is of equal or greater value than the land being converted. Policy AG-2.8. Conservation Easements (RDR/MPSP) Support the efforts of public, private, and non-profit organizations to preserve agricultural areas in the County through dedicated conservation easements, and range land held as environmental mitigation.	economic impacts. Project features and mitigation measures would reduce economic impacts, and compensation would be distributed on a case-by-case basis for split parcels. The project extent would result in overall economic benefits and facilitate regional economic expansion.		
Policy HS-7.4. New Noise or Groundborne Vibration Generating Uses (RDR) Require new commercial and industrial uses to minimize encroachment on incompatible noise or groundborne vibration sensitive land uses. Also consider the potential for encroachment by residential and other noise or groundborne vibration sensitive land uses on adjacent lands that could significantly impact the viability of the commercial or industrial areas.	Inconsistent The project extent would introduce new sources of noise and vibration that could widen existing community divisions, affect social relationships, reduce the quality of life for residents, and alter the existing character and integrity of the communities through which it passes. Project features would minimize the impacts from noise and vibration. Mitigation measures would partially reduce these impacts; however, some severe noise effects would remain.	The Authority and FRA would work with local governments to enhance the public benefits of HSR development so that they help meet the needs of the local communities. The project includes features to minimize noise (NV-IAMF#1) to the maximum extent feasible. While the project includes this feature to implement urban design guidelines, the project would remain inconsistent. Not reconciled.	While the project extent would result in increased noise and vibration to sensitive receptors, the Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes measures to minimize increased noise and vibration.

The Project Section's consistency with regional and local plans and policies is assessed for adopted plans only.

Station Planning, Land Use, and Development

Table 6 Policy Inconsistency, Reconciliation, and Rationale for Station Planning, Land Use, and Development

Policy	Description of Inconsistency	Reconciliation	Rationale
2030 Merced County General Plan (2013)			
Policy LU-2.3: Land Use Activity Limitations (RDR) -- Limit allowed land use within Agricultural and Foothill Pasture areas to agricultural crop production, farm support operations, and grazing and open space uses.	All project alternatives, as one component of the overall statewide HSR system, would introduce a non-allowable land use within Agricultural and Foothill Pasture areas. Alternative 3 would result in the greatest inconsistency with this policy because it would affect the greatest amount of agricultural and pasture land.	The Authority and FRA would work with local governments to enhance the public benefits of HSR development so that they help meet the needs of the local communities, including housing and job opportunities (LU-IAMF#1: HSR Station Area Development: General Principles and Guidelines, and LU-IAMF#2: Station Area Planning and Local Agency Coordination). While the project includes features to implement urban design guidelines to maximize compatible design, the project would introduce a non-allowable use into agricultural and pasture zones and would remain inconsistent. Not reconciled.	While the project extent would introduce non-permitted transportation and industrial uses into agricultural zones, the Authority is mandated to construct and operate the HSR system. This is a state-level project that would have benefits across multiple resource areas. The project design includes features to minimize conflicts with existing land uses (including agricultural land) and land use plans.
Santa Clara County General Plan (1994)			
Policy R-LU 2: Rural unincorporated lands outside cities' Urban Service Areas that are not designated 'Rural Residential' or other specialized land uses shall be designated as a type of 'Resource Conservation Area.' These lands consist primarily of the mountains and foothills, Bay wetlands and lowlands, and valley agricultural lands. Policy R-LU 3: The general intent of each 'Resource Conservation Area' designation is to encourage land uses and densities appropriate to the rural unincorporated areas that also: a. help preserve rural character; b. conserve natural, scenic, and cultural resources;	All project for alternatives would result in introduction of transportation and industrial uses into Resource Conservation Areas and non-permitted land uses into designated agricultural areas. Alternative 3 would result in the greatest inconsistency with this policy because it would affect the greatest amount of agricultural and pasture land.	The Authority and FRA would work with local governments to enhance the public benefits of HSR development so that they help meet the needs of the local communities, including housing and job opportunities (LU-IAMF#1: HSR Station Area Development: General Principles and Guidelines, and LU-IAMF#2: Station Area Planning and Local Agency Coordination). While the project includes features to implement urban design guidelines to maximize compatible design, the project would introduce a non-permitted use into agricultural zones and would remain inconsistent. Not reconciled.	While the project extent would introduce non-permitted transportation and industrial uses into agricultural zones, the Authority is mandated to construct and operate the HSR system. This is a state-level project that would have benefits across multiple resource areas. The project design includes features to minimize conflicts with existing land uses (including agricultural land) and land use plans.

Policy	Description of Inconsistency	Reconciliation	Rationale
c. protect public health and safety from natural and man-made hazards; d. preserve agriculture and prime agricultural soils; e. protect watersheds and water quality; f. enhance air quality; and g. minimize the demand for and cost of public services and facilities. Policy R-LU-11: Allowable land uses shall be limited to: a. agriculture and ancillary uses; b. uses necessary to directly support local agriculture; and c. other uses compatible with agriculture which clearly enhance the long term viability of local agriculture and agricultural lands.			
Morgan Hill 2035 General Plan (2016)			
Policy NRE-1.4. South County Open Space. Preserve and maintain the wide variety of open spaces in the South County; including greenbelt areas, parks, and agricultural uses.	All project alternatives would result in loss of existing open space areas. Alternative 3 would result in the greatest inconsistency with this policy because it would affect the greatest amount of open space area.	The Authority and FRA would work with local governments to enhance the public benefits of HSR development so that they help meet the needs of the local communities, including housing and job opportunities (LU-IAMF#1: HSR Station Area Development: General Principles and Guidelines, and LU-IAMF#2: Station Area Planning and Local Agency Coordination). The project would also incorporate features to minimize impacts on open space, including PK-IAMF#1: Parks, Recreation, and Open Space. While the project includes features to implement urban design guidelines to maximize compatible design and features to minimize effects on open space, the project would remove areas of open space and would remain inconsistent. Not reconciled.	While the project extent would remove some open space, the Authority is mandated to construct and operate the HSR system. This is a state-level project that would have benefits across multiple resource areas. The project design includes features to minimize conflicts with existing land uses (including agricultural land) and land use plans.

Policy	Description of Inconsistency	Reconciliation	Rationale
San Benito County 2035 General Plan (2015)			
Policy NCR-1.1 Maintenance of Open Space. The County shall support and encourage maintenance of open space lands that support natural resources, agricultural resources, recreation, tribal resources, wildlife habitat, water management, scenic quality, and other beneficial uses.	All project alternatives would result in loss of existing open space areas. Alternative 3 would result in the greatest inconsistency with this policy because it would affect the greatest amount of open space area.	The Authority and FRA would work with local governments to enhance the public benefits of HSR development so that they help meet the needs of the local communities, including housing and job opportunities (LU-IAMF#1: HSR Station Area Development: General Principles and Guidelines, and LU-IAMF#2: Station Area Planning and Local Agency Coordination). The project would also incorporate features to minimize impacts on open space, including PK-IAMF#1: Parks, Recreation, and Open Space. While the project includes features to implement urban design guidelines to maximize compatible design and features to minimize effects on open space, the project would remove areas of open space and would remain inconsistent. Not reconciled.	While the project extent would remove some open space, the Authority is mandated to construct and operate the HSR system. This is a state-level project that would have benefits across multiple resource areas. The project design includes features to minimize conflicts with existing land uses (including agricultural land) and land use plans.

The project extent's consistency with regional and local plans and policies is assessed for adopted plans only.
HSR = high-speed rail
Authority = California High-Speed Rail Authority
FRA = Federal Railroad Administration
IAMF = impact avoidance and minimization feature

Agricultural Farmland

Table 7 Policy Inconsistency, Reconciliation, and Rationale for Agricultural Farmland

Policy	Description of Inconsistency	Reconciliation	Rationale
Plan Bay Area 2040 (2017)			
Goal: Open Space and Agricultural Preservation. Direct development within urban footprint … [The goal's] intent [is] to shift travel mode [from car-centric transportation] and achieve the plan's open space and agricultural preservation target.	Inconsistent Implementation of any of the alternatives would permanently convert substantial Important Farmland for operational infrastructure.	Through AG-MM#1, Conserve Important Farmland (Prime Farmland, Farmland of Statewide Importance, Farmland of Local Importance, and Unique Farmland), the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the project extent. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.
Santa Clara County General Plan, 1995–2010 (1994)			
C-RC 37: Agriculture should be encouraged and agricultural lands retained for their vital contributions to the overall economy, quality of life, and for their functional importance to Santa Clara County. C-RC 40. Long term land use stability and dependability to preserve agriculture shall be maintained and enhanced by the following general means:	Inconsistent Implementation of any of the alternatives would permanently convert substantial Important Farmland for operational infrastructure.	Through AG-MM#1, Conserve Important Farmland (Prime Farmland, Farmland of Statewide Importance, Farmland of Local Importance, and Unique Farmland), the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the project extent. In addition, the Authority would fund the	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.

Policy	Description of Inconsistency	Reconciliation	Rationale
b. regulating non-agricultural uses in agricultural areas, and their intensity and impacts on adjacent lands c. maintaining agriculturally-viable parcel sizes R-GD 1.1 1. Preserve the resources and rural character of lands outside Urban Service Areas (USAs). R-GD 3e. Land uses and development permitted under County jurisdiction shall be consistent with the following major County policies: e. preservation of agriculture. R-RC 40b. Long term land use stability and dependability to preserve agriculture shall be maintained and enhanced by the following general means: b. regulating non-agricultural uses in agricultural areas, and their intensity and impacts on adjacent lands R-RC 57 c. Agriculture shall be encouraged and prime agricultural lands retained for their value to the overall economy and quality of life of Santa Clara County, including: c. preservation of a diminishing natural resource, prime agricultural soils. R-LU-8. Santa Clara County is enriched by a special combination of the very finest soils, a very favorable, dependable growing climate, and generally adequate water supplies…. This combination of factors makes it highly desirable that certain lands be preserved for their intrinsic value as		purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	

Policy	Description of Inconsistency	Reconciliation	Rationale
agricultural land and for productive agricultural land uses. SC 14.4. Some prime agricultural lands in South County (particularly within the prime agricultural areas east and south of Gilroy) should be preserved for agricultural use.			
R-RC 61 a, b, c. Allowable land uses in exclusive agricultural areas shall be limited to a. agriculture and ancillary uses, b. uses necessary to directly support local agriculture, and c. other uses compatible with agriculture which clearly enhance the long term viability of local agriculture and agricultural lands. R-LU 11 a, b, c. Allowable land uses shall be limited to: a. agriculture and ancillary uses; b. uses necessary to directly support local agriculture; and c. other uses compatible with agriculture which clearly enhance the long term viability of local agriculture and agricultural lands.	Inconsistent Implementation of any of the alternatives would not serve as an agricultural use and would not provide direct or indirect support to agricultural farmland.	While the project extent alternatives would not provide direct or indirect support to agricultural land, under AG-IAMF#6, Equipment Crossings, the Authority in coordination with the property owners of land in use for agricultural operations would finalize the realignments of any affected access roads to provide equipment crossings to minimize impediments to routine agricultural operations and normal business activities that may result from long-term operation of the project extent. In this way, the project extent would remain as compatible as possible with livestock and equipment movement. While the project extent includes this feature to minimize inconsistency with agricultural farmland, the project extent does not directly support local agriculture nor would it enhance the long term viability of local agriculture and agricultural lands. As a result, the project extent would remain inconsistent. Not reconciled.	HSR has a restricted right-of-way and a limited number of stations. This combination of factors limits the potential for HSR to have an effect outside the immediate corridor.
R-LU-3 d. The general intent of each 'Resource Conservation Area' designation is to encourage land uses and densities appropriate to the rural unincorporated areas that also: d. preserve agriculture and prime agricultural soils.	Inconsistent Implementation of any of the alternatives would permanently convert Important Farmlands within an Agricultural Conservation Easement.	Through AG-MM#1, the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the Central Valley Wye. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.

Policy	Description of Inconsistency	Reconciliation	Rationale
		Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	
Santa Clara County Code of Ordinances (2018)			
Title 18 Zoning, Chapter 18.08 Regulations for A- Agricultural Zoning Districts. Chapter 18.08 designates agricultural zones and permitted uses allowed therein.	Inconsistent Implementation of any of the alternatives would permanently convert Important Farmland for operational infrastructure.	Through AG-MM#1, the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the Central Valley Wye. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.
Santa Clara Valley Agricultural Plan (2018)			
Focus Area: Land Use Policy ▪ **Objective 1:** Recognize Viable Agricultural Lands and Sub-Areas Within the County General Plan and Zoning Ordinance. Strategies / Actions	Inconsistent Implementation of any of the alternatives would not serve as an agricultural use and would not extend zoning or agricultural designations.	While the project extent alternatives would not provide direct or indirect support to agricultural land, under AG-IAMF#6, Equipment Crossings, the Authority in coordination with the property owners of land in use for agricultural operations would finalize the realignments of any affected access roads to provide equipment crossings to minimize impediments to routine agricultural operations and normal business activities that may result from long-term operation of the project extent.	HSR has a restricted right-of-way and a limited number of stations. This combination of factors limits the potential for HSR to have an effect outside the immediate corridor.

Policy	Description of Inconsistency	Reconciliation	Rationale
a. Extend Agricultural zoning to encompass all viable agricultural lands. b. Consider designation of agricultural zoning regions specific to sub-areas in the Agricultural Resource Area (ARA) that share a common identity, for focused application of agricultural protection tools. c. Coordinate with neighboring Santa Clara Valley cities to create consistency in the designation of agricultural areas between the County and Cities' General Plans.		In this way, the project extent would remain as compatible as possible with livestock and equipment movement. While the project extent includes this feature to minimize inconsistency with agricultural farmland, the project extent does not directly support local agriculture nor would it enhance the long term viability of local agriculture and agricultural lands. As a result, the project extent would remain inconsistent. Not reconciled.	
▪ **Objective 2:** Prevent the Conversion of Agricultural Lands to Non-Agricultural Uses Within the Rural Areas. Strategies / Actions a. Prevent the establishment of incompatible uses within the ARA which increase land speculation and impair ongoing agricultural production. b. Prevent conversion of agricultural lands into rural ranchettes that increase land speculation and reduce viability of ongoing neighboring farm operations. c. Enact a County-wide agricultural mitigation fee that requires a mitigation fee for development that converts viable agricultural land to other uses.	Inconsistent Implementation of any of the alternatives would permanently convert substantial Important Farmland for operational infrastructure.	Through AG-MM#1, Conserve Important Farmland (Prime Farmland, Farmland of Statewide Importance, Farmland of Local Importance, and Unique Farmland), the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural conservation easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the project extent. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.

Policy	Description of Inconsistency	Reconciliation	Rationale
▪ **Objective 4:** Reduce Conflict Between Incompatible Uses and Agriculture Within Agricultural Areas. Strategies / Actions a. Require setbacks/buffers for new non-agricultural development within or adjacent to agricultural lands to reduce interface between incompatible land uses and farming. b. Strengthen right-to-farm requirements.	Inconsistent Implementation of any of the alternatives would not serve as an agricultural use and would not provide direct or indirect support to agricultural farmland.	While the project extent alternatives would not provide direct or indirect support to agricultural land, under AG-IAMF#6, Equipment Crossings, the Authority in coordination with the property owners of land in use for agricultural operations would finalize the realignments of any affected access roads to provide equipment crossings to minimize impediments to routine agricultural operations and normal business activities that may result from long-term operation of the project extent. In this way, the project extent would remain as compatible as possible with livestock and equipment movement. While the project extent includes this feature to minimize inconsistency with agricultural farmland, the project extent does not directly support local agriculture nor would it enhance the long term viability of local agriculture and agricultural lands. As a result, the project extent would remain inconsistent. Not reconciled.	HSR has a restricted right-of-way and a limited number of stations. This combination of factors limits the potential for HSR to have an effect outside the immediate corridor.
Focus Area: Regional Agricultural Conservation Easement Program and Other Voluntary Financial Incentives ▪ **Objective 5:** Establish a Regional Agricultural Conservation Easement Purchasing Program for the Santa Clara Valley. Strategies / Actions a. Establish a Regional ACE Purchasing Program.	Inconsistent Implementation of any of the alternatives would permanently convert Important Farmlands within an Agricultural Conservation Easement.	Through AG-MM#1, the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural conservation easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the Central Valley Wye. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.

Policy	Description of Inconsistency	Reconciliation	Rationale
▪ **Objective 6:** Encourage Landowners to Take Advantage of Property Tax Incentives to Keep Land in Agriculture. Strategies / Actions a. Increase participation in the County's Williamson Act Program and Establish a Farmland Security Zone Program.	Inconsistent. Implementation of any of the alternatives would permanently convert Important Farmland, potentially creating remainder parcels that would not meet county criteria for inclusion in Williamson Act and Farmland Security Zone programs and convert Important Farmlands within an Agricultural Conservation Easement	Through AG-MM#1, the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural conservation easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the Central Valley Wye. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.
▪ **Objective 7:** Identify Opportunities and Create Programs that Provide Financial Compensation to Farmers for Providing Ecosystem Benefits (GHG Reduction, Groundwater and Floodplain Protection) Through Farming. Strategies / Actions a. One of the most important means to protect the local agricultural land base is to help ensure that farmers and ranchers can stay profitable over the long-term, reducing the pressure to sell land for development.	Inconsistent Implementation of any of the alternatives would permanently convert Important Farmlands for operational infrastructure.	Through AG-MM#1, the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural conservation easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the Central Valley Wye. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.

Policy	Description of Inconsistency	Reconciliation	Rationale
Focus Area: Agricultural Economic Development Strategy ▪ **Objective 8:** Support the viability of the agricultural economy. Strategies / Actions a. Support farmers in obtaining permits and regulatory compliance associated with actions and activities that support long term agricultural investment and growth of the agricultural economy.	Inconsistent Implementation of any of the alternatives would permanently convert Important Farmlands for operational infrastructure.	Through AG-MM#1, the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural conservation easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the Central Valley Wye. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.
▪ **Objective 9:** Improve the Climate for the Growth of a Diverse, Vibrant, and Innovative Agriculture Economy. Strategies / Actions a. Create an Agricultural Enterprise Program for specific sub-areas of the ARA. b. Coordinate and support the small farms initiative effort under way by the SCC Food Systems Alliance. c. Support expansion of ag tourism. d. Address the need for additional distribution and processing space for agricultural products; include assessment of "hubs" for co-located businesses.	Inconsistent Implementation of any of the alternatives would permanently convert Important Farmlands. for operational infrastructure	Through AG-MM#1, the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural conservation easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the Central Valley Wye. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.

Policy	Description of Inconsistency	Reconciliation	Rationale
▪ **Objective 10:** Support the Growth of New Farms and Creation of New Farmers to Provide Diversity and Long-Term Resiliency in the Local Agricultural Economy. Strategies / Actions a. Address the needs of beginning and immigrant farmers, currently in the Country or interested in starting farming operations in the County, for land access, technical assistance and financial assistance. b. Develop an action plan for implementation of a Farm Incubator or AgPark, with related programs.	Inconsistent Implementation of any of the alternatives would permanently convert Important Farmlands for operational infrastructure	Through AG-MM#1, the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural conservation easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the Central Valley Wye. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.
Santa Clara Valley GreenPrint (2014))			
Goal: Conserve farms, ranches, and other working landscapes to sustain the economic viability of local agriculture. **Strategies for Protecting Farms, Ranches, and Other Working Lands** 1. Protect farms and ranches through fee purchase, conservation easements, and other incentives. a. Partner with local and regional conservation organizations to secure funding for regionally significant farm and ranch protection projects with a focus on (1) farms and ranches that demonstrate long-term economic viability and operational adaptability,	Inconsistent Implementation of any of the alternatives would permanently convert substantial Important Farmland for operational infrastructure.	Through AG-MM#1, Conserve Important Farmland (Prime Farmland, Farmland of Statewide Importance, Farmland of Local Importance, and Unique Farmland), the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the project extent. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.

Policy	Description of Inconsistency	Reconciliation	Rationale
and that provide multiple environmental benefits and (2) urban-edge farmlands threatened by conversion to non-agricultural uses. b. Increase the Authority's funding and staffing capacity to manage conservation easements by developing program guidelines and mitigation policies. c. Explore the use of new conservation tools to help make farming economically viable, such as affirmative easements, right to purchase at farm value, and payment for ecosystem service programs. d. As new funding becomes available, develop a matching grant program to fund local Resource Conservation Districts, UC Cooperative Extension, land trusts, or other nonprofit conservation partners that assist farmers and ranchers with agricultural and natural resource protection projects. f. Work with conservation partners to conduct outreach to agricultural landowners to raise awareness about the Authority's conservation programs.		to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	
2. Manage Open Space Authority lands for natural resource protection and viable agricultural operations, and to model effective public-private partnerships. a. Engage experts to develop comprehensive management plans	Inconsistent Implementation of any of the alternatives would permanently convert Important Farmland for operational infrastructure.	Through AG-MM#1, the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource

Policy	Description of Inconsistency	Reconciliation	Rationale
for Authority properties and easements that integrate agricultural and natural resources. b. Work with the Natural Resources Conservation Service, Resource Conservation Districts, and other partners to share best practices for land management and secure funding to implement farm and rangeland conservation projects on Authority preserves and nearby private lands that enhance water quality, habitat protection, carbon sequestration, and other ecosystem services. c. Demonstrate and interpret successful conservation practices on Authority lands, such as hedgerows, sediment basins, irrigation efficiency projects, or other climate-smart projects. d. Explore opportunities for beginning farmers to lease Authority agricultural lands, for example, through California FarmLink. Offer competitive leases and long-term land security in exchange for tenants' commitment to implementing on-farm conservation and stewardship projects.		replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the Central Valley Wye. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	areas. The project extent design includes measures to minimize conversion of agricultural lands.
4. Engage in local, regional, and state land use planning and policy projects to promote farm and rangeland protection and the economic viability of regional agriculture. a. Work with the Santa Clara County Local Agency Formation	Inconsistent Implementation of any of the alternatives would permanently convert Important Farmland for operational infrastructure.	Through AG-MM#1, the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource

Policy	Description of Inconsistency	Reconciliation	Rationale
Commission (LAFCO), the County, and cities to maintain and strengthen agricultural zoning, maintain effective urban growth boundaries, and develop and implement effective agricultural mitigation policies and projects. b. Work with state legislators to restore funding for the Williamson Act (including a focus on urban-edge farms, which are grossly underrepresented in Williamson Act contracts) and engage County leadership to secure funding and provide incentives, such as transportation project mitigation, and urban agriculture incentive zones to increase agricultural viability and protect open space. c. Advocate for agricultural tax credits such as California's Natural Heritage Tax Credit program. e. Initiate multi-benefit agricultural conservation projects that contribute to groundwater recharge and water supplies, water quality, and flood risk reduction. g. Advocate for a portion of AB 32 cap-and-trade revenues to be directed to farmland conservation. h. Strengthen SB 375 to integrate agricultural protection into the local Sustainable Communities Strategy (Plan Bay Area) and to promote agricultural protection within Association of Bay Area		replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the Central Valley Wye. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	areas. The project extent design includes measures to minimize conversion of agricultural lands.

Policy	Description of Inconsistency	Reconciliation	Rationale
Government (ABAG) Priority Conservation Areas. i. Support adoption of minimum statewide standards for mitigating the loss of farmland when a project results in the conversion of farmland to non-agricultural uses. j. Engage with transportation projects needing agricultural mitigation, such as the High Speed Rail and highway widening projects. k. Support implementation of a local agricultural enterprise zone to use tax benefits to incentivize farmland protection and value-added farm enterprises			
Paj^ a^ ro River Watershed Integrated Regional Water Management Plan (2014)			
Flood Protection Goal: Ensure flood management strategies are developed and implemented through a collaborative and watershed-wide approach and are designed to maximize opportunities for comprehensive management of water resources. **Objectives:** 2. Reach consensus on the Pajaro River Risk Reduction Project necessary to protect existing urban areas and infrastructure from flooding and erosion from the 100-year event and to maximize opportunities to protect agricultural land uses. 5. Provide community benefits beyond flood protection such as public access, open space, recreation, agriculture preservation and economic development	Inconsistent Implementation of any of the alternatives would permanently convert Important Farmland for operational infrastructure.	Through AG-MM#1, the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the Central Valley Wye. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.

Policy	Description of Inconsistency	Reconciliation	Rationale
Envision San José 2040 (2011)			
LU-20.1 1. Protect and preserve the remaining farmlands within San José's sphere of influence that are not planned for urbanization in the timeframe of the Envision General Plan, such as mid- and south Coyote Valley, through the following means: 1. Strongly discourage conversion of agricultural lands outside the Urban Growth Boundary to non-agricultural uses. LU-20.9. Explore use of agricultural easements, transfer/purchase of development rights, or other options to keep Mid-Coyote Valley as permanent agriculture.	Inconsistent Implementation of any of the alternatives would permanently convert Important Farmland for operational infrastructure.	Through AG-MM#1, the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the Central Valley Wye. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.
Morgan Hill 2035 General Plan (2016)			
NRE-1.4. South County Open Space. Preserve and maintain the wide variety of open spaces in the South County; including greenbelt areas, parks, and agricultural uses.	Inconsistent Implementation of any of the alternatives would permanently convert Important Farmland for operational infrastructure.	Through AG-MM#1, the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the Central Valley Wye. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.

Policy	Description of Inconsistency	Reconciliation	Rationale
		to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	
Morgan Hill ZA-14-11 Agricultural Mitigation Ordinance (2015)			
1. Preserve open space agricultural lands and agricultural activity within the Morgan Hill sphere of influence.	Inconsistent Implementation of any of the alternatives would permanently convert Important Farmland for operational infrastructure.	Through AG-MM#1, the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the Central Valley Wye. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.
Gilroy 2020 General Plan (2002)			
4.02. Agricultural Land Preservation. Work with the County, LAFCo, and other relevant agencies as well as private landowners to protect agricultural and grazing lands from encroachment by urban uses, and to encourage the use of such lands for active cultivation. Specifically, implement the strategies and actions recommended by the South County Agricultural Study (Strategies to Balance Planned Growth and Agricultural Viability in the Areas South and East of Gilroy, October 1996).	Inconsistent Implementation of any of the alternatives would permanently convert Important Farmland for operational infrastructure.	Through AG-MM#1, the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the Central Valley Wye. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.

Policy	Description of Inconsistency	Reconciliation	Rationale
		Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	
2035 San Benito County General Plan (2015)			
LU-3.2. Agricultural Integrity and Flexibility. The County shall protect the integrity of existing agricultural resources, and provide for flexibility and economic viability of farming and ranching operations. LU-3.12. Agricultural Viability of Small Parcel Sizes. The County shall require project applicants seeking to subdivide agriculturally-zoned parcels to demonstrate the continued viability of lots less than 40 acres for commercial agriculture operations.LU-3.14. Land Trusts and Financial Incentives. The County shall consider land trusts and financial incentives to preserve agricultural soil resources and to protect the integrity of important agricultural areas for future use. NCR-1.1. Maintenance of Open Space. The County shall support and encourage maintenance of open space lands that support agricultural resources.	Inconsistent Implementation of any of the alternatives would permanently convert Important Farmland for operational infrastructure.	Through AG-MM#1, the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural easements from willing sellers. This program would preserve Important Farmland in an amount commensurate with the quantity and quality of the converted farmlands, within the same agricultural regions as the impacts occur. The replacement ratio would be 1:1 for lands that are permanently, directly converted to nonagricultural use by the Central Valley Wye. In addition, the Authority would fund the purchase of an additional increment of acreage for agricultural conservation easements at a ratio of not less than 0.5:1 for Important Farmland within a 25-foot wide area adjacent to HSR permanently fenced infrastructure. While the project extent includes this mitigation to preserve agricultural farmland, Important Farmland would be converted to nonagricultural uses. As a result, the project extent would remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project extent design includes measures to minimize conversion of agricultural lands.
2030 Merced County General Plan (2013)			
AG-2.16: Coordinate with the California High-Speed Rail Authority to locate the high-speed rail lines along existing major transportation corridors, such as SRs 99 or 152, to minimize the conversion of	Inconsistent Implementation of any of the alternatives would not create high-speed rail lines that fully follow an existing major	Through AG-MM#1, the Authority would fund the DOC California Farmland Conservancy Program's purchase of agricultural easements from willing sellers. Aesthetics and Visual Quality

Table 8 Policy Inconsistency, Reconciliation, and Rationale for Aesthetics and Visual Quality

Policy	Description of Inconsistency	Reconciliation	Rationale
Santa Clara County General Plan (1994)			
Policy C-GD 17: Provide protection of a scenic corridor in Coyote Valley adjacent to US 101.	Inconsistent C-GD 17. Implementation of the East Gilroy LMF/MOWF under Alternative 3 or South Gilroy LMF/MOWF under Alternatives 1 and 2 would place a large industrial facility in a rural agricultural setting east of the city of Gilroy that would degrade the visual environment.	Prior to construction the contractor will document, through issue of a technical memorandum, how the Authority's aesthetic guidelines have been employed to minimize visual impacts. The Authority seeks to balance providing a consistent, project-wide aesthetic with the local context for the numerous HSR non-station structures across the state. Examples of aesthetic options that can be applied to non-standard structures in the HSR system will be provided to local jurisdictions (AVR-IAMF#1). The Authority will also require its contractors to document that the Authority's *Aesthetic Design Review Process* has been followed (AVR-IAMF#2). While the proposed project includes these features to minimize visual impacts, it will remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes measures that will soften the appearance of HSR infrastructure to minimize visual impacts on sensitive viewers.
Policy C-PR 39: Protect the visual integrity of the scenic gateways to the South County (Pacheco Pass, Hecker Pass, Route 101 south of Gilroy, and a Coyote greenbelt area north of Morgan Hill). Policy R-PR 41: Protect the visual integrity of the scenic gateways to the South County—Pacheco Pass, Hecker Pass, Route 101 south of Gilroy, and a Coyote greenbelt area north of Morgan Hill.	Inconsistent Implementation of any alternative would degrade the visual environment along SR 152 in the Pacheco Creek Valley by regrading and removing the existing topography and land cover to provide a tunnel portal. Alternatives 1 and 3 would implement HSR aerial structure parallel to US 101 in the Coyote Valley that would block views and overwhelm the existing topography with its scale.	Prior to construction the contractor will document, through issue of a technical memorandum, how the Authority's aesthetic guidelines have been employed to minimize visual impacts. The Authority seeks to balance providing a consistent, project-wide aesthetic with the local context for the numerous HSR non-station structures across the state. Examples of aesthetic options that can be applied to non-standard structures in the HSR system will be provided to local jurisdictions (AVR-IAMF#1). The Authority will also require its contractors to document	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes measures that will soften the appearance of HSR infrastructure to minimize visual impacts on sensitive viewers.

Policy	Description of Inconsistency	Reconciliation	Rationale
		that the Authority's *Aesthetic Design Review Process* has been followed (AVR-IAMF#2). While the proposed project includes these features to minimize visual impacts, it will remain inconsistent. Not reconciled.	
Policy C-RC 61: Public and private development and infrastructure located in areas of special scenic significance should not create major, lasting adverse visual impacts	Inconsistent Implementation of any alternative would degrade the visual environment along SR 152 in the Pacheco Creek Valley by regrading and removing the existing topography and land cover to provide a tunnel portal. All alternatives would implement HSR aerial structure parallel to SR 152 in the Pacheco Creek Valley that would block views and overwhelm the existing topography with its scale.	Prior to construction the contractor will document, through issue of a technical memorandum, how the Authority's aesthetic guidelines have been employed to minimize visual impacts. The Authority seeks to balance providing a consistent, project-wide aesthetic with the local context for the numerous HSR non-station structures across the state. Examples of aesthetic options that can be applied to non-standard structures in the HSR system will be provided to local jurisdictions (AVR-IAMF#1). The Authority will also require its contractors to document that the Authority's *Aesthetic Design Review Process* has been followed (AVR-IAMF#2). While the proposed project includes these features to minimize visual impacts, it will remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes measures that will soften the appearance of HSR infrastructure to minimize visual impacts on sensitive viewers.
Policy R-GD 20: Grading and terrain alteration should conserve the natural landscape and resources, minimize erosion impacts, protect scenic resources, habitat, and water resources. Policy R-GD 25: Grading associated with roads, bridges, retaining walls, or similar improvements related to access requirements should not create a significant visual scar or impact to the environment. They should generally	Inconsistent Implementation of any alternative would degrade the visual environment along SR 152 in the Pacheco Creek Valley by regrading and removing the existing topography and land cover to provide a tunnel portal.	Prior to construction the contractor will document, through issue of a technical memorandum, how the Authority's aesthetic guidelines have been employed to minimize visual impacts. The Authority seeks to balance providing a consistent, project-wide aesthetic with the local context for the numerous HSR non-station structures across the state. Examples of aesthetic options that can be applied to non-standard structures in the HSR system will be provided to local jurisdictions (AVR-IAMF#1). The Authority will also require its contractors to document that the Authority's *Aesthetic Design Review Process* has been followed (AVR-IAMF#2).	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes measures that will soften the appearance of HSR infrastructure to minimize visual impacts on sensitive viewers.

Policy	Description of Inconsistency	Reconciliation	Rationale
follow natural terrain and contours to the maximum extent feasible. Policy R-RC 101: Roads, building sites, structures, and public facilities shall not be allowed to create major or lasting visible scars on the landscape. Policy R-RC(i) 36: Protect the scenic value of the following major County thoroughfares and entranceways through state scenic highway designation, including SR 152 east of Gilroy (Pacheco Pass), SR 152 west of Gilroy (Hecker Pass), and US 101 south of the San Jose city limits. Policy SC 16.6: The visual integrity of the scenic gateways to the South County (Pacheco Pass, Hecker Pass, Route 101 south of Gilroy, and a Coyote greenbelt area north of Morgan Hill) should be protected.		While the proposed project includes these features to minimize visual impacts, it will remain inconsistent. Not reconciled.	
Policy R-LU 79: New public transportation facilities shall be compatible with the land uses in the areas in which they are located and consistent with the County's General Plan.	Inconsistent Implementation of the East Gilroy LMF/MOWF under Alternative 3 or South Gilroy LMF/MOWF under Alternatives 1 and 2 would place a large industrial facility in a rural location that would degrade the visual environment.	Prior to construction the contractor will document, through issue of a technical memorandum, how the Authority's aesthetic guidelines have been employed to minimize visual impacts. The Authority seeks to balance providing a consistent, project-wide aesthetic with the local context for the numerous HSR non-station structures across the state. Examples of aesthetic options that can be applied to non-standard structures in the HSR system will be provided to local jurisdictions (AVR-IAMF#1). The Authority will also require its contractors to document that the Authority's *Aesthetic Design Review Process* has been followed (AVR-IAMF#2). While the proposed project includes these features to minimize visual impacts, it will remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes measures that will soften the appearance of HSR infrastructure to minimize visual impacts on sensitive viewers.

Policy	Description of Inconsistency	Reconciliation	Rationale
2030 Merced County General Plan (2013)			
Policy NR-4.1: Promote the preservation of agricultural land, ranch land, and other open space areas as a means of protecting the County's scenic resources.	Inconsistent Implementation of any alternative would cross through agricultural and open-space lands. Views to and from these lands would be blocked by HSR infrastructure.	Prior to construction the contractor will document, through issue of a technical memorandum, how the Authority's aesthetic guidelines have been employed to minimize visual impacts. The Authority seeks to balance providing a consistent, project-wide aesthetic with the local context for the numerous HSR non-station structures across the state. Examples of aesthetic options that can be applied to non-standard structures in the HSR system will be provided to local jurisdictions (AVR-IAMF#1). The Authority will also require its contractors to document that the Authority's *Aesthetic Design Review Process* has been followed (AVR-IAMF#2). While the project includes these features to minimize visual impacts, views would not be restored and the project will remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes measures that will soften the appearance of HSR infrastructure to minimize visual impacts on sensitive viewers.
Envision: San José 2040 General Plan (2011)			
Policy IN-1.9: Design new public and private utility facilities to be safe, aesthetically pleasing, compatible with adjacent uses, and consistent with the Envision General Plan goals and policies for fiscal sustainability, environmental leadership, an innovative economy, and quality neighborhoods. Policy CD-9.1: Ensure that development within the designated Rural Scenic Corridors is designed to preserve and enhance attractive natural and built vistas. Policy CD-9.3: Ensure that development along designated Rural	Inconsistent Alternatives 1 or 3 would place an aerial structure along Monterey Highway in the Coyote Valley that would block views and overwhelm the existing topography with its scale.	Prior to construction the contractor will document, through issue of a technical memorandum, how the Authority's aesthetic guidelines have been employed to minimize visual impacts. The Authority seeks to balance providing a consistent, project-wide aesthetic with the local context for the numerous HSR non-station structures across the state. Examples of aesthetic options that can be applied to non-standard structures in the HSR system will be provided to local jurisdictions (AVR-IAMF#1). The Authority will also require its contractors to document that the Authority's *Aesthetic Design Review Process* has been followed (AVR-IAMF#2). While the proposed project includes these features to minimize visual impacts, views would not be restored and the project will remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes measures that will soften the appearance of HSR infrastructure to minimize visual impacts on sensitive viewers.

Policy	Description of Inconsistency	Reconciliation	Rationale
Scenic Corridors preserves significant views of the Valley and mountains, especially in, or adjacent to, Coyote Valley, the Diablo Range, the Silver Creek Hills, the Santa Teresa Ridge, and the Santa Cruz Mountains. Policy CD-10.1: Recognize the importance of Gateways in shaping perceptions of San José.			
Morgan Hill 2035 General Plan (2016)			
Policy NRE-2.1: Hillside and Ridgeline Views. Protect views of hillsides, ridgelines, and prominent natural features surrounding the City. These features help define the City's historic rural character, sense of place, image and identity.	Inconsistent Implementation of any alternative would include aerial structures or embankments that would block distant views to prominent natural features surrounding Morgan Hill for viewers adjacent to HSR. Alternatives 1 and 3 would place an aerial structure along US 101 that would block views. Alternative 2 would grade-separate roadways over HSR and UPRR where overcrossings and embankments would block distant views to prominent natural features surrounding Morgan Hill for viewers adjacent to HSR.	Prior to construction the contractor will document, through issue of a technical memorandum, how the Authority's aesthetic guidelines have been employed to minimize visual impacts. The Authority seeks to balance providing a consistent, project-wide aesthetic with the local context for the numerous HSR non-station structures across the state. Examples of aesthetic options that can be applied to non-standard structures in the HSR system will be provided to local jurisdictions (AVR-IAMF#1). The Authority will also require its contractors to document that the Authority's *Aesthetic Design Review Process* has been followed (AVR-IAMF#2). While the proposed project includes these features to minimize visual impacts, views would not be restored and the project will remain inconsistent. Not reconciled.	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resource areas. The project design includes measures that will soften the appearance of HSR infrastructure to minimize visual impacts on sensitive viewers.
Policy NRE-6.4: Tree Preservation and Protection. Preserve and protect mature, healthy trees whenever feasible, particularly native trees, historically significant trees, and other trees which are of significant size or of significant aesthetic value to the	Inconsistent Implementation of Alternative 2 would remove all Keesling's Shade Trees along Monterey Highway from the northern city limit of Morgan Hill to Cochrane Road.	Prior to construction the contractor will document, through issue of a technical memorandum, how the Authority's aesthetic guidelines have been employed to minimize visual impacts. The Authority seeks to balance providing a consistent, project-wide aesthetic with the local context for the numerous HSR non-station structures across the state. Examples of aesthetic options that can be applied to non-standard structures in the HSR system will be	The Authority is mandated to construct and operate the HSR project. Cultural Resources

Table 9 Policy Inconsistency, Reconciliation, and Rationale for Cultural Resources

Policy	Description of Inconsistency	Reconciliation	Rationale
Envision San José 2040 General Plan (2011)			
Goal ER-10: Preserve and conserve archaeologically significant structures, sites, districts and artifacts in order to promote a greater sense of historic awareness and community identity. Goal LU-13: Preserve and enhance historic landmarks and districts in order to promote a greater sense of historic awareness and community identity and contribute toward a sense of place.	Inconsistent. Significant adverse impacts would occur to known historical resources, including human remains. Additionally, there is a potential for construction activities to encounter unknown archaeological resources or human remains.	Through implementation of CUL-MM#1, the Authority would complete Phased Identification inventory for archaeological resources and utilize or further develop treatment plans for any identified resources that would be impaired by the project. Implementation of CUL-MM#2 would insure that construction crews are trained to identify archaeological resources during construction activities, provide for construction monitoring by qualified professionals in areas of archaeological sensitivity, and establish procedures to stop work in the event of a discovery. Also in accordance with CUL-MM#2, if human remains are encountered, the appropriate state and federal laws would be followed to determine whether the remains are affiliated with a Native American tribe; if so, such remains would be treated appropriately. In accordance with CUL-MM#3, in the event that an unknown archaeological resource is encountered and cannot be avoided, mitigation measures would be applied as stipulated by the MOA and ATP. CUL-MM#4 would require a relocation plan to be prepared and implemented for resources that the alternative would demolish. CUL-MM#4 would be applied to resources where it appears that the resource could feasibly be relocated without degradation of its integrity of setting, design, materials, workmanship, feeling, and association. CUL-MM#6 would be applied to require that properties experiencing a significant impact be fully documented prior to construction to record the character-defining features, and CUL-MM#7 would be applied to provide for the creation of interpretive materials using documentation prepared under CUL-MM#6. CUL-MM#10 would require that new station facilities be designed in a manner consistent with the SOI's Standards for Rehabilitation. CUL-MM#11 would relocate an ATC site away from the location of a historical	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resources areas. Through project features and implementation of mitigation measures, the Authority would reconcile potential inconsistencies and avoid, minimize, or mitigate impacts on cultural resources.

Policy	Description of Inconsistency	Reconciliation	Rationale
		resource, 415 Illinois Avenue, and would prevent the resource's demolition. With the implementation of CUL-MM#1, CUL-MM#2, CUL-MM#3, CUL-MM#4, CUL-MM#6, CUL-MM#7, CUL-MM#10, and CUL-MM#11, the inconsistency would be reconciled and the project would be consistent with these goals and policies.	
Santa Clara County General Plan (1994, revised 2006)			
Goal 5.1: Heritage Resource Protection. Protection and preservation of heritage resources both natural (e.g. heritage trees; and paleontological resources) and cultural (e.g. historic sites and structures, and archeological sites). Cultural heritage resources reflecting the contributions to society of all cultures acknowledged, preserved and commemorated. Policy C-RC-52: Heritage Resources Preservation. Prevention of unnecessary losses to heritage resources should be ensured as much as possible through adequate ordinances, regulations, and standard review procedures. Mitigation efforts, such as relocation of the resource, should be employed where feasible when projects will have significant adverse impact upon heritage resources.	Inconsistent. Significant adverse impacts would occur to known historical resources, including human remains. Additionally, there is a potential for construction activities to encounter unknown archaeological resources or human remains.	Through implementation of CUL-MM#1, the Authority would complete Phased Identification inventory for archaeological resources and utilize or further develop treatment plans for any identified resources that would be impaired by the project. Implementation of CUL-MM#2 would insure that construction crews are trained to identify archaeological resources during construction activities, provide for construction monitoring by qualified professionals in areas of archaeological sensitivity, and establish procedures to stop work in the event of a discovery. Also in accordance with CUL-MM#2, if human remains are encountered, the appropriate state and federal laws would be followed to determine whether the remains are affiliated with a Native American tribe; if so, such remains would be treated appropriately. In accordance with CUL-MM#3, in the event that an unknown archaeological resource is encountered and cannot be avoided, mitigation measures would be applied as stipulated by the MOA and ATP. CUL-MM#4 would require a relocation plan to be prepared and implemented for resources that the alternative would demolish. CUL-MM#4 would be applied to resources where it appears that the resource could feasibly be relocated without degradation of its integrity of setting, design, materials, workmanship, feeling, and association. CUL-MM#6 would be applied to require that properties experiencing a significant impact be fully documented prior to construction to record the character-defining features, and CUL-MM#7 would be applied to provide for the creation of interpretive materials using documentation prepared	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resources areas. Through project features and implementation of mitigation measures, the Authority would reconcile potential inconsistencies and avoid, minimize, or mitigate impacts on cultural resources.

Policy	Description of Inconsistency	Reconciliation	Rationale
		under CUL-MM#6. CUL-MM#10 would require that new station facilities be designed in a manner consistent with the SOI's Standards for Rehabilitation. CUL-MM#11 would relocate an ATC site away from the location of a historical resource, 415 Illinois Avenue, and would prevent the resource's demolition. With the implementation of CUL-MM#1, CUL-MM#2, CUL-MM#3, CUL-MM#4, CUL-MM#6, CUL-MM#7, CUL-MM#10, and CUL-MM#11, the inconsistency would be reconciled and the project would be consistent with these goals and policies.	
City of Santa Clara General Plan (2010)			
Policy 5.6.2-P1: Areas of Historic Sensitivity. Evaluate any proposed changes to properties within 100 feet of historic resources on the City's list of Architecturally or Historically Significant Properties for potential negative effects on the historic integrity of the resource or its historic context. Goal 5.6.3-G1: Archaeological and Cultural Resources. Protection and preservation of cultural resources, as well as archaeological and paleontological sites.	Inconsistent. Significant adverse impacts would occur to known historical resources located within the area of potential effects. Additionally, there is a potential for construction activities to encounter unknown archaeological resources or human remains. Furthermore, there is a potential for construction activities to affect the 100-foot setting of historical resources located outside of the area of potential effects.	Through implementation of CUL-MM#1, the Authority would complete Phased Identification inventory for archaeological resources and utilize or further develop treatment plans for any identified resources that would be impaired by the project. Implementation of CUL-MM#2 would insure that construction crews are trained to identify archaeological resources during construction activities, provide for construction monitoring by qualified professionals in areas of archaeological sensitivity, and establish procedures to stop work in the event of a discovery. Also in accordance with CUL-MM#2, if human remains are encountered, the appropriate state and federal laws would be followed to determine whether the remains are affiliated with a Native American tribe; if so, such remains would be treated appropriately. In accordance with CUL-MM#3, in the event that an unknown archaeological resource is encountered and cannot be avoided, mitigation measures would be applied as stipulated by the MOA and ATP. CUL-MM#4 would require a relocation plan to be prepared and implemented for resources that the alternative would demolish. CUL-MM#4 would be applied to resources where it appears that the resource could feasibly be relocated without degradation of its integrity of setting, design, materials, workmanship, feeling, and association. CUL-MM#6 would be applied to require that properties experiencing a significant impact be fully documented prior	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resources areas. Through project features and implementation of mitigation measures, the Authority would reconcile potential inconsistencies and avoid, minimize, or mitigate impacts on cultural resources.

Policy	Description of Inconsistency	Reconciliation	Rationale
		to construction to record the character-defining features, and CUL-MM#7 would be applied to provide for the creation of interpretive materials using documentation prepared under CUL-MM#6. CUL-MM#10 would require that new station facilities be designed in a manner consistent with the SOI's Standards for Rehabilitation. CUL-MM#11 would relocate an ATC site away from the location of a historical resource, 415 Illinois Avenue, and would prevent the resource's demolition. However, mitigation measures would apply only to historical resources within the area of potential effects. With the implementation of CUL-MM#1, CUL-MM#2, CUL-MM#3, CUL-MM#4, CUL-MM#6, CUL-MM#7, CUL-MM#10, and CUL-MM#11, one inconsistency would be reconciled and the project would be consistent with Goal 5.6.3-G1. The project would remain inconsistent with Policy 5.6.2-P1.	
City of Morgan Hill 2035 General Plan (2016)			
Policy HC-8.1: Identify and protect historic resources. Identify and protect heritage resources from loss and destruction.	Inconsistent. Significant adverse impacts would occur to known historical resources. Additionally, there is a potential for construction activities to encounter unknown archaeological resources or human remains.	Through implementation of CUL-MM#1, the Authority would complete Phased Identification inventory for archaeological resources and utilize or further develop treatment plans for any identified resources that would be impaired by the project. Implementation of CUL-MM#2 would insure that construction crews are trained to identify archaeological resources during construction activities, provide for construction monitoring by qualified professionals in areas of archaeological sensitivity, and establish procedures to stop work in the event of a discovery. Also in accordance with CUL-MM#2, if human remains are encountered, the appropriate state and federal laws would be followed to determine whether the remains are affiliated with a Native American tribe; if so, such remains would be treated appropriately. In accordance with CUL-MM#3, in the event that an unknown archaeological resource is encountered and cannot be avoided, mitigation measures would be applied as stipulated by the MOA and ATP. CUL-MM#4 would require a relocation plan to be prepared and implemented for resources that the alternative would	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resources areas. Through project features and implementation of mitigation measures, the Authority would reconcile potential inconsistencies and avoid, minimize, or mitigate impacts on cultural resources.

Policy	Description of Inconsistency	Reconciliation	Rationale
		demolish. CUL-MM#4 would be applied to resources where it appears that the resource could feasibly be relocated without degradation of its integrity of setting, design, materials, workmanship, feeling, and association. CUL-MM#6 would be applied to require that properties experiencing a significant impact be fully documented prior to construction to record the character-defining features, and CUL-MM#7 would be applied to provide for the creation of interpretive materials using documentation prepared under CUL-MM#6. CUL-MM#10 would require that new station facilities be designed in a manner consistent with the SOI's Standards for Rehabilitation. CUL-MM#11 would relocate an ATC site away from the location of a historical resource, 415 Illinois Avenue, and would prevent the resource's demolition. With the implementation of CUL-MM#1, CUL-MM#2, CUL-MM#3, CUL-MM#4, CUL-MM#6, CUL-MM#7, CUL-MM#10, and CUL-MM#11, the inconsistency would be reconciled and the project would be consistent with these goals and policies.	
San Benito County 2035 General Plan (2015)			
Goal NCR-7: To protect, preserve, and enhance the unique cultural and historic resources in the county.	Inconsistent. Significant adverse impacts would occur to known historical resources. Additionally, there is a potential for construction activities to encounter unknown archaeological resources or human remains.	Through implementation of CUL-MM#1, the Authority would complete Phased Identification inventory for archaeological resources and utilize or further develop treatment plans for any identified resources that would be impaired by the project. Implementation of CUL-MM#2 would insure that construction crews are trained to identify archaeological resources during construction activities, provide for construction monitoring by qualified professionals in areas of archaeological sensitivity, and establish procedures to stop work in the event of a discovery. Also in accordance with CUL-MM#2, if human remains are encountered, the appropriate state and federal laws would be followed to determine whether the remains are affiliated with a Native American tribe; if so, such remains would be treated appropriately. In accordance with CUL-MM#3, in the event that an unknown archaeological resource is encountered and cannot be avoided, mitigation measures would be	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resources areas. Through project features and implementation of mitigation measures, the Authority would reconcile potential inconsistencies and avoid, minimize, or mitigate impacts on cultural resources.

Policy	Description of Inconsistency	Reconciliation	Rationale
		applied as stipulated by the MOA and ATP. CUL-MM#4 would require a relocation plan to be prepared and implemented for resources that the alternative would demolish. CUL-MM#4 would be applied to resources where it appears that the resource could feasibly be relocated without degradation of its integrity of setting, design, materials, workmanship, feeling, and association. CUL-MM#6 would be applied to require that properties experiencing a significant impact be fully documented prior to construction to record the character-defining features, and CUL-MM#7 would be applied to provide for the creation of interpretive materials using documentation prepared under CUL-MM#6. CUL-MM#10 would require that new station facilities be designed in a manner consistent with the SOI's Standards for Rehabilitation. CUL-MM#11 would relocate an ATC site away from the location of a historical resource, 415 Illinois Avenue, and would prevent the resource's demolition. With the implementation of CUL-MM#1, CUL-MM#2, CUL-MM#3, CUL-MM#4, CUL-MM#6, CUL-MM#7, CUL-MM#10, and CUL-MM#11, the inconsistency would be reconciled and the project would be consistent with these goals and policies.	
2030 Merced County General Plan (2013)			
Goal RCR-2: Protect and preserve the cultural, archaeological, and historic resources of the County in order to maintain its unique character. Policy RCR-2.1: Archaeological Site and Artifact Protection. Require development projects that affect archaeological sites and artifacts to avoid disturbance or damage to these sites. Policy RCR-2.5: Human Remains Discovery. Requires that, in the event of	Inconsistent Significant adverse impacts would occur to known historical resources. Additionally, there is a potential for construction activities to encounter unknown archaeological resources or human remains.	Through implementation of CUL-MM#1, the Authority would complete Phased Identification inventory for archaeological resources and utilize or further develop treatment plans for any identified resources that would be impaired by the project. Implementation of CUL-MM#2 would insure that construction crews are trained to identify archaeological resources during construction activities, provide for construction monitoring by qualified professionals in areas of archaeological sensitivity, and establish procedures to stop work in the event of a discovery. Also in accordance with CUL-MM#2, if human remains are encountered, the appropriate state and federal laws would be followed to determine whether the remains are affiliated with a Native	The Authority is mandated to construct and operate the HSR project. This is a state-level project that would have benefits across multiple resources areas. Through project features and implementation of mitigation measures, the Authority would reconcile potential inconsistencies and avoid, minimize, or mitigate impacts on cultural resources.

Policy	Description of Inconsistency	Reconciliation	Rationale
discovery of human remains on any project construction site, all work in the vicinity of the find will cease and the County coroner and Native American Heritage Commission will be notified.		American tribe; if so, such remains would be treated appropriately. In accordance with CUL-MM#3, in the event that an unknown archaeological resource is encountered and cannot be avoided, mitigation measures would be applied as stipulated by the MOA and ATP. CUL-MM#4 would require a relocation plan to be prepared and implemented for resources that the alternative would demolish. CUL-MM#4 would be applied to resources where it appears that the resource could feasibly be relocated without degradation of its integrity of setting, design, materials, workmanship, feeling, and association. CUL-MM#6 would be applied to require that properties experiencing a significant impact be fully documented prior to construction to record the character-defining features, and CUL-MM#7 would be applied to provide for the creation of interpretive materials using documentation prepared under CUL-MM#6. CUL-MM#10 would require that new station facilities be designed in a manner consistent with the SOI's Standards for Rehabilitation. CUL-MM#11 would relocate an ATC site away from the location of a historical resource, 415 Illinois Avenue, and would prevent the resource's demolition. With the implementation of CUL-MM#1, CUL-MM#2, CUL-MM#3, CUL-MM#4, CUL-MM#6, CUL-MM#7, CUL-MM#10, and CUL-MM#11, the inconsistency would be reconciled and the project would be consistent with these goals and policies.

1 EXECUTIVE SUMMARY

1.1 Scope and Approach

HNTB studied constructability of the San Jose to Merced (JM) Section of the California High-Speed Rail (CHSR) project. Information used included preliminary designs with plans, profiles and cross-sections at the Draft Project Engineering for Project Definition (PEPD) submittal stage.

We approached the study with a mission to understand the project and provide feedback on concerns that a construction contractor or manager might have. We identified numerous factors that could challenge designers, contractors, and agency construction managers. We have provided discussion, a set of risks, and recommendations for action or further study.

1.2 Conclusions and Recommendations

We have concluded that each of the four alternatives, as currently presented, can be built, but they present varying degrees of complexity, cost, duration, and impact on the environment and the public. Physical and other constraints of each alternative will vary the expense, duration, and impact of each one.

“Big ticket” concerns that should be addressed in detail before the project is built include:

- Property acquisition will be long and complex. The California High-Speed Rail Authority (Authority) should carry out property acquisitions itself and not delegate this to the design-build contractors.
- Construction work on route segments should not be started before all property acquisitions are made for the segment.
- Responsibility, processes, and payment mechanisms for dealing with unforeseen environmental contamination should be established in construction contract documents.
- Construction and maintenance (C&M) agreements with stakeholders, including local jurisdictions, California Department of Transportation (Caltrans), and utilities should be comprehensive, detailed, and executed before beginning construction.
- Reflect stakeholder agreements in the construction contract documents, and bind contractors to perform in accordance with the stakeholder agreements.
- Accommodation of Caltrain and Union Pacific Railroad (UPRR) train operations will constrain construction operations and increase the construction cost and duration.
- At-grade and viaduct cross-sections are the most buildable cross-sections.
- Trench and embankment cross-sections present the most difficult staging challenges, mostly due to constrained right-of-way (ROW) width, earthmoving operations, and difficulties stemming from maintaining Caltrain and UPRR operations without modification.

2 INTRODUCTION

2.1 Purpose

The purpose of this Constructability Assessment Report is to provide a general overview of the different types of construction elements involved in this section of the project, identify potential construction concerns, and provide insight into the activities and general sequencing necessary to complete the construction.

This report is divided into various sections that each discuss a separate topic:

- Section 3: Provides a general overview of the project
- Section 4: Provides options and recommendations for a series of construction contract packages.
- Section 5: Discusses general construction elements with probable production rate estimates.
- Section 6: Provides additional insight into individual subsection construction elements, challenges, and general sequencing of construction
- Section 7: Identifies staging areas.
- Section 8: Provides a casting yard layout.
- Section 9: Describes construction sequencing.
- Section 10: Provides a general discussion on traffic control and detours for the project.
- Section 11: Describes pollution control.
- Section 12: Provides a list of probable construction permits that may be required.
- Section 13: Discusses Third Party Coordination and Agreements.
- Section 14: Describes potential excavation hazards.
- Section 15: Discusses ROW acquisition.
- Section 16: Discusses construction pollution control.
- Section 17: Provides summary conclusions.
- Section 18: References.

2.2 Project Overview

The California High-Speed Rail Authority (Authority) proposes to construct, operate, and maintain an electric-powered HSR system in California. When completed, the nearly 800-mile train system would provide new passenger rail service to more than 90 percent of the state's population. More than 200 weekday trains would serve the statewide intercity travel market. The HSR will be capable of operating speeds of up to 220 miles per hour (mph), with state-of-the-art safety, signaling, and automated train control (ATC) systems. The system will connect and serve the state's major metropolitan areas, extending from San Francisco to Los Angeles and Anaheim in Phase 1, with extensions to Sacramento and San Diego in Phase 2. The HSR system will be designed to be capable of a nonstop operational service time between San Francisco and Los Angeles of 2 hours and 40 minutes.

The statewide California HSR Project has been divided into a number of geographic sections for the planning, environmental approval, design, and implementation of the project. This memorandum supports the section of the HSR System between San Jose and Merced, and specifically covers the San Jose to Central Valley Wye project extent from Scott Boulevard in Santa Clara to Carlucci Road in Merced County). See Figure 2-1 Proposed San Jose to Merced Project Section.

Figure 2-1 Proposed San Jose to Merced Project Section

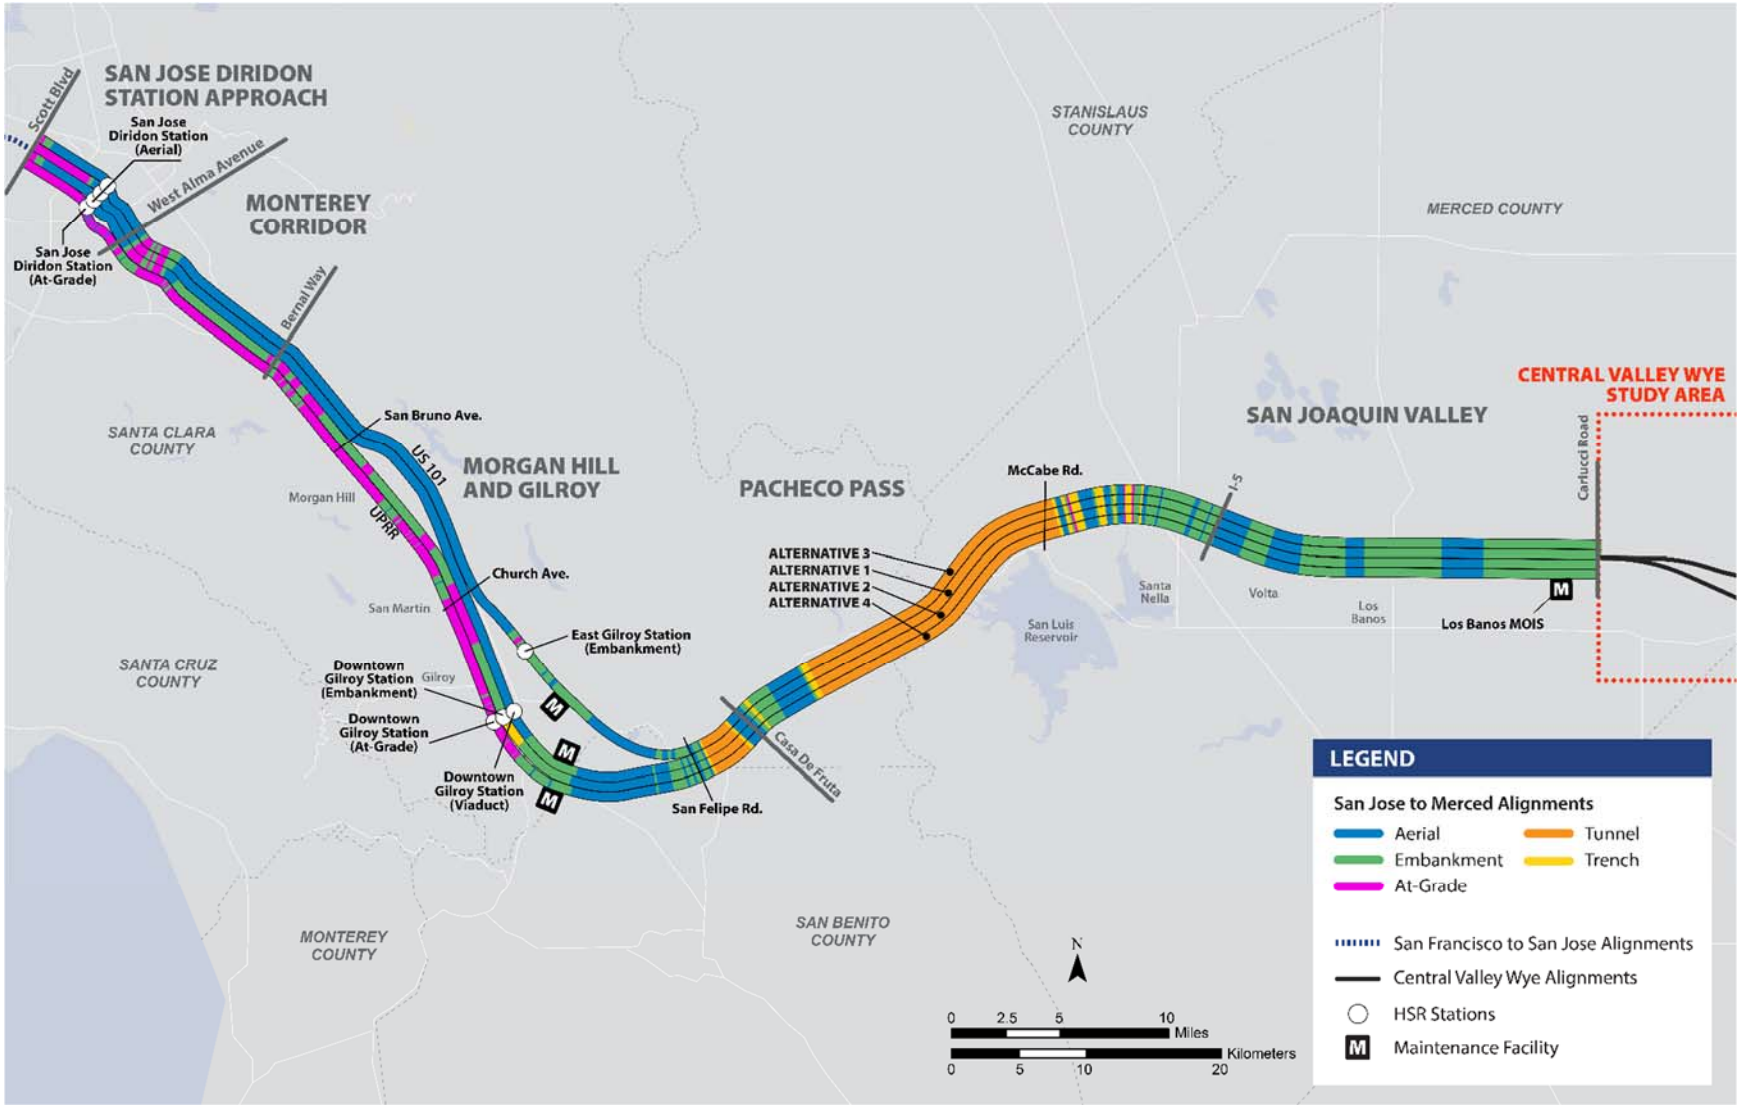
2.3 Project Description

The San Jose to Central Valley Wye segment of the HSR corridor extends approximately 90 miles and includes portions of blended and dedicated track and systems; HSR stations located at San Jose, Diridon, and Gilroy; a maintenance of way facility (MOWF) in the Gilroy area; and a maintenance of way siding (MOWS) west of Turner Island Road in the Central Valley. The project continues south from San Jose to Gilroy, then east through the Pacheco Pass to the Central Valley and ends at Carlucci Road the western boundary of the Central Valley Wye.

The infrastructure and systems of the HSR system consist of HSR trains, tracks, stations, automatic train control (ATC) and communication sites, overhead contact system (OCS) and traction power distribution systems, and infrastructure and vehicle maintenance facilities. The design of dedicated system portions of each HSR alternative includes a double-track rail system to accommodate planned project operational needs for high-capacity rail movement. The HSR safety criteria requires avoidance of at-grade intersections on dedicated HSR alignments where operating speeds will exceed 125 mph; accordingly, the system will require grade-separated overcrossings or undercrossings for roadways that intersect the planned right-of-way. In areas where operating speeds will be less than 125 mph, at-grade intersections may be used. The HSR system will be on an access-controlled guideway with mainline tracks, maintenance, and storage facilities including intrusion detection and monitoring systems designed to prevent access by unauthorized vehicles, persons, animals, and objects. The ends of the HSR trainsets would include a collision response management system to minimize the effects of a collision.

The project comprises the following five subsections shown in Figure 2-2:

- **San Jose Diridon Station Approach**—Extends approximately 6 miles from north of San Jose Diridon Station at Scott Boulevard in Santa Clara to West Alma Avenue in San Jose. This subsection includes the San Jose Diridon Station and overlaps the southern portion of the San Francisco to San Jose Project Section.
- **Monterey Corridor**—Extends approximately 9 miles from West Alma Avenue to Bernal Way in the community of South San Jose. This subsection is entirely within the city of San Jose.



Source: Authority 2018c, 2018d

Figure 2-2 San Jose to Central Valley Wye Project Map and Subsections

- **Morgan Hill and Gilroy**—Extends approximately 30–32 miles from Bernal Way in the community of South San Jose to Casa de Fruta Parkway/State Route (SR) 152 in the community of Casa de Fruta in Santa Clara County.
- **Pacheco Pass**—Extends approximately 25 miles from Casa de Fruta Parkway/SR 152 to Interstate 5 (I-5) in Merced County.
- **San Joaquin Valley**—Extends approximately 18 miles from I-5 to Carlucci Road in unincorporated Merced County.

2.4 Alignment Alternatives

The Authority and the Federal Railroad Administration (FRA) have developed four end-to-end alternatives for the project. Table 2-1 shows the distinguishing features of each alternative by subsection.

Table 2-1 San Jose to Central Valley Wye Design Options by Subsection

Subsection/Design Options	Alternative 1	Alternative 2	Alternative 3	Alternative 4
San Jose Diridon Station Approach				
Viaduct to Scott Boulevard		X	X	
Viaduct to I-880	X			
Blended, At-Grade				X

For Alternatives 1, 2, and 3, HSR transitions from the blended system between San Francisco and Santa Clara to a fully dedicated double-track system north of the San Jose Diridon Station at either Scott Boulevard or near I-880. Within the dedicated system, track will either be elevated or grade separated from surface roadways so there will be no grade crossings between the high-speed train and vehicular traffic.

Alternative 4 would extend the blended system through San Jose to Gilroy and would be substantially within the existing Caltrain and UPRR rights-of-way before transitioning to a fully dedicated system. Within the blended service portions, train speed would be limited to 110 mph,

and at-grade roadway crossings would be permitted with additional safety improvements. Two tracks would be provided for blended passenger service with an additional track for dedicated freight use by UPRR. Alternative 4 would utilize existing and in-progress infrastructure improvements developed by Caltrain for its Caltrain Modernization Program, including electrification of the Caltrain corridor between San Francisco and Tamien under the Caltrain Peninsula Corridor Electrification Project (PCEP), and the installation of an advanced signal system under the Communications Based Overlay Signal System (CBOSS) Positive Train Control Project south to Control Point Lick. It would also require modifications and safety and security improvements at existing Caltrain stations to accommodate HSR trains.

Alternative 1 (Morgan Hill to Downtown Gilroy Viaduct Alternative) would comprise the following alternative subsection alignments and elements (from north to south):

1. San Jose Diridon Station Approach Subsection – from Scott Boulevard to I-880, HSR travels at-grade in the blended Caltrain corridor and transitions to a dedicated aerial viaduct structure south of I-880 that connects to the San Jose Diridon Station;
2. Monterey Corridor Subsection – from West Alma south, the alignment continues on an aerial viaduct structure;
3. Morgan Hill and Gilroy Subsection – south of Kittery Court, HSR travels primarily on an aerial viaduct through the Downtown Gilroy Station, the South Gilroy MOWF, and Tunnel 1;
4. Pacheco Pass Subsection – the HSR alignment travels through a 13.5-mile-long tunnel; and
5. San Joaquin Valley Subsection - HSR transitions to an embankment at Henry Miller Road, travels through the Los Banos MOWS and connects to the Central Valley Wye HSR Section at Carlucci Road.

Alternative 2 (East UPRR/Downtown Gilroy Embankment) would include the following alternative alignments and elements:

1. San Jose Diridon Station Approach Subsection - starting at Scott Boulevard, the alignment transitions from blended service with Caltrain to a dedicated aerial viaduct that connects to San Jose Diridon Station;
2. Monterey Corridor Subsection - from West Alma south to Bernal/Kittery Court, the HSR alignment travels primarily on embankment;
3. Morgan Hill and Gilroy Subsection – south of Kittery Court, HSR travels on an embankment through the Downtown Gilroy Station and the South Gilroy MOWF through Tunnel 1 to the Pacheco Pass;
4. Pacheco Pass Subsection – is consistent with Alternative 1; and
5. San Joaquin Valley Subsection – is consistent with Alternative 1.

Alternative 3 (Morgan Hill/East Gilroy) would include the following alternative alignments and elements:

1. San Jose Diridon Station Approach Subsection – is consistent with Alternative 2, starting at Scott Boulevard, the alignment transitions from blended service with Caltrain to a dedicated aerial viaduct that connects to the San Jose Diridon Station;
2. Monterey Corridor Subsection – is consistent with Alternative 1;
3. Morgan Hill and Gilroy Subsection – south of Kittery Court, HSR continues primarily on a viaduct through East Gilroy (including East Gilroy Station and East Gilroy MOWF) and Tunnel 1 to Pacheco Pass;
4. Pacheco Pass Subsection – is consistent with Alternative 1; and
5. San Joaquin Valley Subsection – is consistent with Alternative 1.

Alternative 4 (Blended At-grade) would include the following alternative alignments and elements:

1. San Jose Diridon Station Approach Subsection – starting at Scott Boulevard, the alignment remains as blended service with Caltrain to an at-grade San Jose Diridon Station and continuing along the existing Caltrain ROW to West Alma Avenue (south of the Caltrain Tamien Station);
2. Monterey Corridor Subsection – from West Alma Avenue south to Bernal/Kittery Court, the HSR alignment travels at-grade in the existing Caltrain ROW to CP Lick, then in UPRR ROW to south of Kittery Court;
3. Morgan Hill and Gilroy Subsection – south of Kittery Court, HSR travels at-grade in the existing UPRR ROW to the Downtown Gilroy Station, at which point the blended service transitions to a dedicated HSR ROW and a South Gilroy MOWF to the west of the mainline. South of the MOWF, the alignment is consistent with Alternative 1;
4. Pacheco Pass Subsection – is consistent with Alternative 1; and
5. San Joaquin Valley Subsection – is consistent with Alternative 1.

2.5 Infrastructure Improvements and Phasing

HSR blended service from Santa Clara to Gilroy will be phased per the Authority's 2018 Business Plan. This stipulates that improvements will be phased to meet 2027 and 2033 operating requirements, as follows:

2027 Peninsula Service – San Jose to Gilroy

- Convert all at-grade crossings to four quadrant gates with channelization to permit operations up to 110 mph;
- Maintain current maximum allowable speed (MAS) of 79 mph;
- Raise and extend two at-grade platforms at the San Jose Diridon Station for HSR use;
- Between CP Coast and Diridon, provide for two electrified tracks for blended service, and two non-electrified tracks for UPRR use;
- South of Diridon to Gilroy, provide for one non-electrified track (MT1), two electrified tracks (MT2 and MT3);
- Reconfigure VTA/Caltrain stations at San Martin, Morgan Hill, Blossom Hill and Capitol to be accessed from MT2 and MT3; and
- Reconfigure Gilroy Station with two high level platforms for HSR use and provision for HSR bypass tracks, and two low level platforms for Caltrain/TAMC
- Construct the South Gilroy MOWF with access from UPRR.
- Provide completely access controlled ROW using fences, trespass guards and quad-gates.

2029 Valley to Valley Service

- Provide connecting tracks south from Gilroy Station to connect with dedicated HSR alignment;

2033 Phase One

- Increase MAS to 110 mph between Santa Clara and Gilroy.

3 SEGMENT CONSTRUCTION PACKAGING

HSR construction segmentation can be done geographically (by physical area); by trade (per the type of construction to be done); or by end use (to achieve interim operational goals upon completion). The Authority must also decide whether it wants to perform the work in smaller or larger segments.

The decision on how to segment the project will be determined by considering the following factors (per our understanding of the project's goals):

- Create useable HSR track segments.
- Maintain Caltrain passenger and UPRR train operations.
- Type of construction (tunneling, aerial, earthwork, buildings).
- Phasing precedent preparatory activities (e.g., environmental and utilities clearance).
- Dirt balance for overall project and within contract packages.
- Funding limits from cash flow and budget restrictions.
- Contract package size limit to attract bidders of desirable firm size and experience.
- Local jurisdictional boundaries.
- Appropriate locations for track tie-in and other joins at contract boundaries.
- Station locations for Caltrain and HSR.

Geographical contract packaging would establish route lengths that end at specific boundary locations selected according to criteria deemed suitable by the Authority. The selection would factor in the predominance of the type of work and the ability to achieve useable track segments.

Trade contract packaging brings designers and contractors with specialty experience within a certain construction type into their field of expertise. At the extreme end of the scale, in the multiple prime contractor delivery method a project owner would hire a series of specialty contractors to deliver a particular scope of work.

Stations - transit agencies try to build a certain consistency into their stations while also making them unique to their locations per accepted architectural practice. Consistency usually extends to technical details and equipment to make the maintenance of buildings and other facilities easier for the agency workforce.

A **combined** method of contracting with features of both geographic and trades may be considered. This would make the geographic general contract the fundamental method but use trades contracts for portions of the work. Work that is appropriate for separate contracts includes:

- Environmental remediation
- Demolition
- Utilities potholing and relocation
- Roadway relocations
- Utility relocations
- Initial track and signal relocation
- Stations and other buildings

There can be benefits to doing other preparatory work in advance of general contractor mobilization. Where dirt balance can be achieved across contract package boundaries, for instance, it may be economical to have an earthmoving contractor excavate and fill before the

general contracts are awarded. The same might be considered for station relocations, drilled piers for trench walls, and facilities such as railroad spurs and barge piers for transporting spoil.

There may also be benefits to contracting certain items for the entire project rather than leaving them to be arranged by individual contractors. These include:

- Disposal sites for remediated materials
- Disposal sites for clean spoil
- Rail freight for material delivery and spoil removal

The Authority has stated an intent to have rail and systems (power, controls, communications, signal) installed by specialty contractors that are separate from the builders for the civil and utilities infrastructure.

3.1 Risks

- Need to carefully craft scopes to integrate with other contract packages; otherwise projects can be difficult to coordinate, leading to conflicts, delays, and extra costs.
- Large general contractor resources can be used to generate large amounts of information, requests, and claims that can overwhelm agency staffs that do not have equivalent resources.
- Single issues that block work — such as ROW holdouts preventing certification, bankruptcy, or court order to stop work — may inordinately delay large contract packages for long route segments.
- Short contract packages increase the need for coordination and the likelihood of conflicts that must be resolved by the Owner.
- General contractors may not have expertise in certain construction types, leading to heavy reliance on its subcontractors for that work creating communications problems that inhibit problem solving.
- Numerous prime contractors tasked with work in a single location increases the Owner's coordination duties and its liability for coordination issues that delay contractors.

3.2 Recommendations

- Award the following Construction Contract Packages:
    - Contract Package 1 – Early Interim Service between Santa Clara and Gilroy
    - Contract Package 2 – Tunneling Packages
    - Contract Package 3 – At Grade, Viaduct, and Trench Packages
    - Contract Package 4 – Rail Infrastructure and Testing
    - Contract Package 5 – Stations and Maintenance Facilities

  (See Appendix E for potential packages and estimated schedules)
- Use a single contractor to install rail and systems.

4 GENERAL CONSTRUCTION METHODS

A portion of the San Jose to Merced section of the HSR alignment construction will occur immediately adjacent to in-use and operating roadways, operating UPRR tracks, and electrified Caltrain tracks. The construction process must accommodate for these facilities remaining operational during construction.

4.1 Clearing and Grubbing

This consists of the removal of top soil, trees, minor physical objects, and other vegetation from the construction site with the use of specialized equipment for raking, cutting, and grubbing.

Production rates for clearing and grubbing can vary from one (1) to ten (10) acres a day depending on the following

- Utility relocations required
- Urban or rural areas
- Amount of wooded areas
- Dedicated construction equipment and resources

4.2 Demolition

Demolition consists of removing buildings, existing bridges, and other large features that conflict with the planned construction. Different methods of demolition could be employed depending on resources available. Relocation of building occupants and roadways will need to take place prior to demolition. A typical two-story building can be demolished in one day.

A demolition survey and plan will be developed for structure demolition. If any hazardous materials such as asbestos are identified, a specialist will need to be brought in to remove and dispose of the hazardous materials in a safe controlled way.

4.3 Earthwork

Earthwork consists of both excavation and embankment. Excavation is the removal of soils by mechanical equipment. Embankment is the placement and compaction of soils for the construction process by means of mechanical equipment.

All material used for the embankment and roadbed of the tracks must be classified to determine the amount of organics, liquid limits, plasticity index, and gradation. A standard system of soil classification will be established to provide requirements for the anticipated individual soil types that will be used for the track and roadway foundations. Material with high organics will be classified as muck and must not be used in the construction of the bed for the tracks or roadways. It is anticipated that muck will be disposed of by placing it along slopes to provide optimum growing conditions for sod and other vegetation. High plastic material with liquid limits greater than 50 will have limited use in the embankment and it is anticipated it will be placed outside the 2:1 control line of the slope from the bed of the tracks and roads.

Soil surveys will be performed to determine the classifications of existing soils within the proposed alignments. The soils survey will be used to determine the dispositions of existing soils. Poor soil conditions will pose significant construction issues and lead to compounded problems for permanent construction with settlement issues. Representative samples of existing soils will be taken at frequencies recommended by the project team and agreed to by the Authority.

Sampling of existing soils and soils expected to be transported to the project site for use as embankment will be tested to provide information needed during the construction process. Proper compaction of soils must be achieved with certified test results to document all compaction requirements. Proctors for each sampled soil type will be established during the construction and will detail optimum moisture for the particular soil type being used, and graphically show the range of densities associated with the different moisture contents. Proctors will be performed in the laboratory to simulate field operations. Target compaction densities and moisture contents will be provided for all material types. All earthwork must be constructed within the optimal ranges of moisture for the particular soil type being used. This will allow for proper densities of the soil and result in a firm and unyielding foundation.

Embankment areas will need to be staged to allow minimal handling of material. Storage areas must be identified that do not conflict with the construction, while also being close to the borrow material placement to avoid repetitive handling. Temporary construction easements must be considered during plan development to ensure sufficient storage areas are established. Excavation and removal of unsuitable soils will have to be stockpiled at determined locations for ease of transport off site to locations identified by the design-build firm. All earthwork will need to follow recommendations of the Geotechnical Investigation Report, which will address issues such as soil types, subsidence, consolidation, liquefaction, seismic response etc., and will provide recommendations for the mitigation of these factors in design and construction.

Earthmoving will be done using conventional methods. For very short distances (less than 300 feet), dozers will be used to shift earth. For distances from 300 feet up to 2,500 feet, scrapers will be used. For distances greater than 2,500 feet (e.g., when moving earth for underpasses and overpasses), trucks will be employed. See Figure 4-1 for the expected haul distances for various types of equipment as outlined in the Caterpillar Performance Handbook, Edition 38.

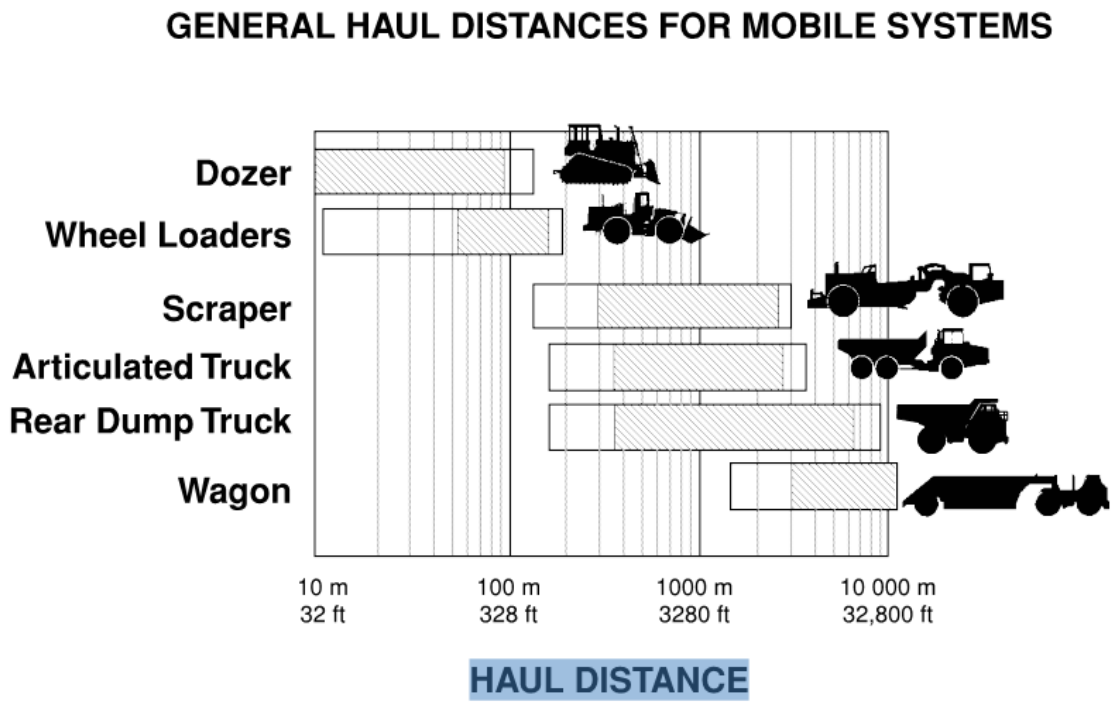

Figure 4-1 Expected Haul Distances from Various Types of Equipment

Production rates for excavation and embankment can range from 900 cubic yards to 7,500 cubic yards per day. Factors that affect production rates include:

- Haul route distances
- Compaction rates of different soil types
- Types of excavation required – lateral, ditch, subsoil, trench, or foundations

4.4 Roadway

Roadway reconstruction is a major component of the HSR project. Due to the alignment of the HSR, roads are being proposed to be raised, lowered, realigned, and constructed as overpasses or undercrossings, and at various locations, new frontage roads are proposed. After the earthwork operations are performed, roadway subgrade, base, and final pavement sections will be constructed. It is assumed major diversions to the existing roadways that will be grade separated will be avoided or minimized if necessary. Detours and temporary traffic control measures will be required to maintain traffic circulation during construction. The duration of each grade separation construction will vary depending on the type of temporary traffic control measure used (e.g. general detours provide a shorter construction duration).

It is anticipated that full and partial street closures will be needed for the reconstruction of roadways. The type of closures will be based on the proximity of alternate routes (these are analyzed in further detail in the environmental Transportation technical report). In general, a full roadway closure will result in a significantly shorter overall construction period than if a partial closure was to be used. This shorter period could be as much as a 50% reduction depending on the location. Preliminary staging concepts have been developed as part of these studies and detailed staging and maintenance of traffic will be developed during the final design phase.

It is anticipated that highway and roadway work associated with the HSR Project will be done using conventional methods and in the following sequence as necessary:

- Demolition.
- Utility relocations (utility relocation timing may influence highway work schedule), which could require trenching, segmental pipe construction, concrete pipe or conduit poured in situ, and storm drain catch basins poured in situ or placing precast units.
- Excavation.
- Grading.
- Placing aggregate base.
- Constructing concrete curb and gutter (in some cases this may be carried out before the previous stage), which can be done by building forms and pouring concrete in place or by using a curb and gutter placing machine.
- Placing concrete or asphalt concrete base and top surfaces.

Coordination with all local agencies and Caltrans (for state highways) will be required as final design by the design-builder progresses.

Assumed Production Rates:

- Subgrade ranges from 1,400 square yards to 1,800 square yards per day.
- Base construction ranges from 1,000 square yards to 4,500 square yards per day.
- Asphalt pavements ranges from 500 tons to 2,000 tons per day. Thickness of pavement section must be factored to determine the square yards that can be placed per day.
- Concrete pavements range from 3,000 square yards to 5,000 square yards per day.

4.5 Drainage

Drainage will involve both permanent and temporary systems for track and road construction. Temporary systems will be developed to allow for construction activities that must be performed in dry conditions. Means and methods for temporary dewatering could include well point systems, sock drains, and bypass pumping from one retention area to another. Ground water considerations will need to be considered for all operations involving dewatering.

Permanent drainage features are anticipated to include closed pipe systems, open channels, swales, box culverts, inlets, and manholes. Production rates for installing permanent drainage will vary depending on depth of cut, soil conditions, installation methods, and structure type.

The HSR project drainage requirements are as follows:

- Maintain existing drainage flow patterns.
- Disperse on-site runoff to encourage local infiltration.
- Improve existing drainage capacity if the HSR design exacerbates existing drainage problems or flooding where the existing system is known to be undersized.
- Treat runoff from pollution-generating impervious surfaces to the maximum extent practicable to meet water quality objectives and water quality standards set forth by the California Regional Water Quality Control Board (RWQCB) before discharging to receiving waters.

The at-grade or track-on embankment segments will require drainage ditches or swales on both sides of the track to collect rainfall. The emphasis will be placed on on-site retention of runoff which will require the construction of detention basins or infiltration basins. These basins will be unlined and will be designed to remove litter, settleable solids (debris), total suspended solids, and pollutants; and encourage infiltration. For embankment segments supported by retaining walls, trackbed drainage will be collected and conveyed in a pipe system. Storm drains may also be incorporated behind the top of the retaining walls to accommodate peak events. All concentrated flow will be addressed in a noneroding manner.

Tracks set below grade or in a trench section will have drainage systems to collect stormwater and direct it to a pump station. Stormwater will be pumped to a retention/treatment basin outside the trench and released into a drainage facility.

For elevated track segments where the HSR crosses an unpaved rural landscape, the runoff will be collected and conveyed in pipes down the sides of the pier columns to infiltration swales. Where the guideway crosses developed urban areas, the runoff will again be conveyed in pipes down the sides of the piers but typically it will be discharged into the local stormwater drainage system.

Inside flood areas, transversal drainage would be designed to allow water permeability through the subgrade to avoid generating a dam effect. This drainage system will be composed of distributed transversal pipes.

4.6 Structures

Five construction methods are being considered for the guideway. Methods include aerial structures, trench excavation and construction, at-grade construction, bored tunneling, and cut-and-cover tunneling. Costs and schedule are primary concerns for selection of any one alternative. Typically means and methods used by construction companies will drive both cost and schedule, but for this Constructability Assessment Report, production will be based on estimated values typically experienced during construction of similar magnitude.

4.6.1 Aerial Structures

The typical HSR bridge consists of a single-cell pre-stressed concrete box girder supporting two parallel tracks spanning approximately 110 ft. At certain locations, there are geometric constraints that require the bridge span to exceed 110 ft. up to a factor of 4. For this reason, it is unlikely that only one method of construction will be used.

The type of construction method selected by the contractor will depend on the geometry and location of the structure. The typical aerial sub-structure consists of cast-in place (CIP) bent cap, column(s) and a pile cap supported by structural steel, precast/pre-stressed piles, or cast-in-drilled hole (CIDH) piles. There are five types of superstructure construction methods proposed for the aerial guideway:

1. Full-span precast
2. Segmental precast
3. Balanced cantilever
4. CIP construction on falsework,
5. Steel plate girder or steel truss

A. Full Span Precast Construction

In this construction method, the box girder is precast as a full span and transported along the length of the previously constructed aerial guideway.

The precast 110-foot girder weighs approximately 900 tons and would be set in place using a special gantry system. This gantry system was used on the Taiwan High-Speed Rail Project for girders of a similar size. The girders will be transported to the leading end of the viaduct using the constructed viaduct and a special launching carrier.

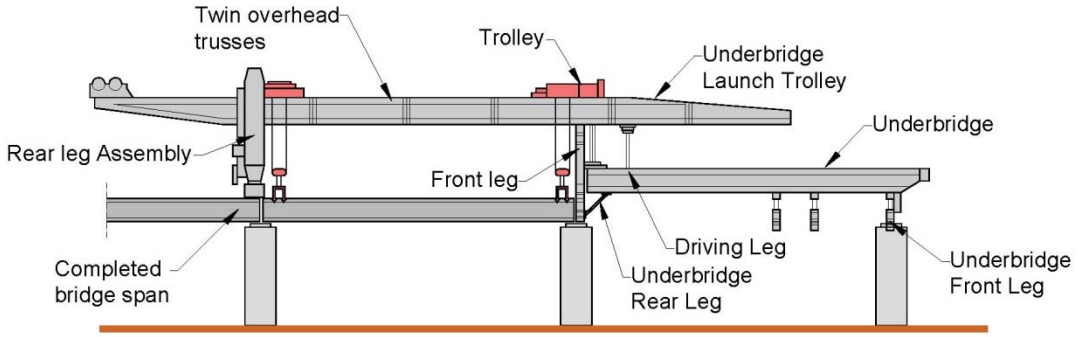

Figure 4-2 Precast Full Span Construction Schematic

The typical construction sequence is as follows:

i. The substructure (footings and columns) is constructed using traditional methods.

ii. Precast girders are cast and pre-stressed in advance and stored in the precast yard.

iii. The launching gantry is set up and construction proceeds by progressively installing the precast spans with a minimum of one span erected per day.

iv. At locations where spans are cast-in-place on falsework or other construction method, the construction needs to be completed as an early item in order for the launching equipment to get across these areas without interrupting the construction process.

Figure 4-3 Taiwan High Speed Rail *(Courtesy of Uwe Baier)*

The advantages of the full span precast construction method are:

- Fabrication of the box girder at the precast plant.
- Rapid installation.
- No ground level space requirements during the box girder installation phase.
- Independent of the weather conditions.

The disadvantages are:

- Need to have a large precast plant that can adapt to the dimensions and installation rate.
- Need for dimensioning the structure for the extra load of box girders transported during the installation phase.
- Need to acquire hoisting cranes, transport vehicles, and special placement machinery to position the box girders on the structure.
- Dependent upon two machines (one per direction); therefore, any faults or equipment failure could impact the overall schedule.
- Requires a different method for spans that exceed the typical length of 110 feet.

The erection rate will depend on how far the construction site is from the casting yard. The paper *"Full-span Precast Launching Method (FPLM) Analysis with Dynamic Simulation – Case Studies of the Taiwan High-Speed Rail (THSR) Project",* Nai-Hsin, Tsung-Chih Chiu, Kuei-Yen Chen, October 2007, indicates an average of 1.1 segments per day is an assumed erection rate based on the historical production rates of each THSR segment. A precast casting yard can be placed at the center, next to the aerial to be constructed, that can deliver segments to each end of the aerial. The pre-casting yard would have to produce 2.2 segments per day to deliver segments to both ends of the viaduct.

The sequence of construction and estimated construction duration is illustrated in Figure 4-4 Precast Full Span Sequence and Production Rate.

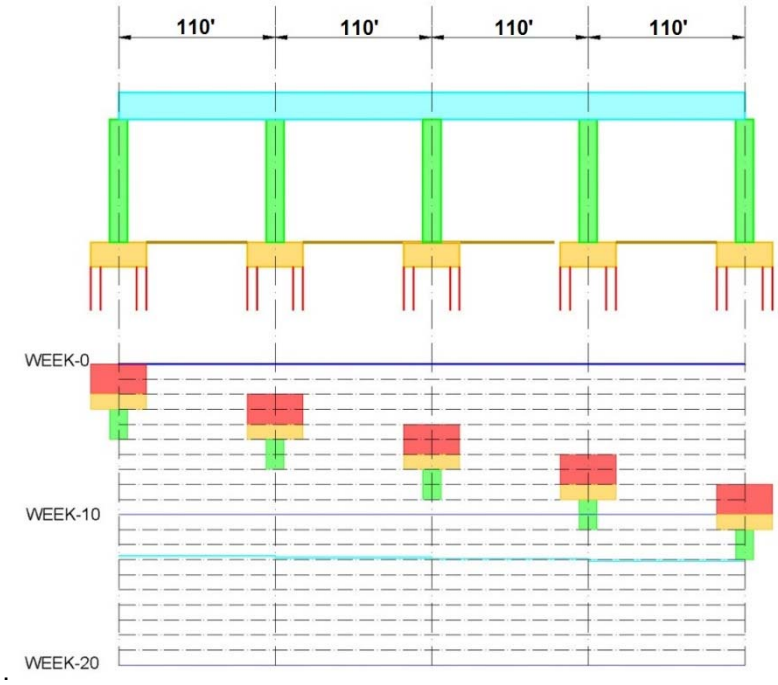

Figure 4-4 Precast Full Span Sequence and Production Rate

The cost of this method will depend on the schedule constraints and the size of the contract. The main expenses are the cost of the launching equipment and the requirement of having large precasting/storage yards next to the viaduct. For example, for a 25-mile aerial it is estimated that two launching gantries (each serving a half of the aerial) and two 20-acre casting/storage yards would be required to meet a 2.5-year superstructure construction duration. Prior to superstructure erection, the schedule should factor one year for design and manufacture of the gantry equipment and three months for installation. This procurement can occur at the same time as the precast yard construction and foundation installation. Cost can be reduced when the schedule is extended allowing the contractor to use the same erection equipment on each half of the aerial.

Appendix A includes illustrations of equipment layout and space requirements for typical full span precast construction along the Monterey Highway Guideway.

B. Span-by-Span (Precast) Segmental Construction

In this construction method, the box girder is constructed with precast segments that are individually brought to the construction site and are joined together using prestressing tendons. This construction method, as well as the full span precast method, can be applied to long aerials with repetitive span length and with minimal angular variation. Both construction types are adequate for standard mass-produced structures typical in long viaducts. Generally, girders are simply supported to avoid having cast-in-place closure joints but continuity tendons can be provided at the bents when required. Having simple-supported girders allows a simpler post-tensioning layout.

The usual range for segmental construction is 100 ft. to 150 ft. For spans shorter than 100 ft., box girders are not as economical as beams. For spans longer than 150 ft., the

size/number of the segments becomes difficult to handle, the post-tensioning tendons become difficult to anchor to the pier tables, and the erection truss size becomes unpractical.

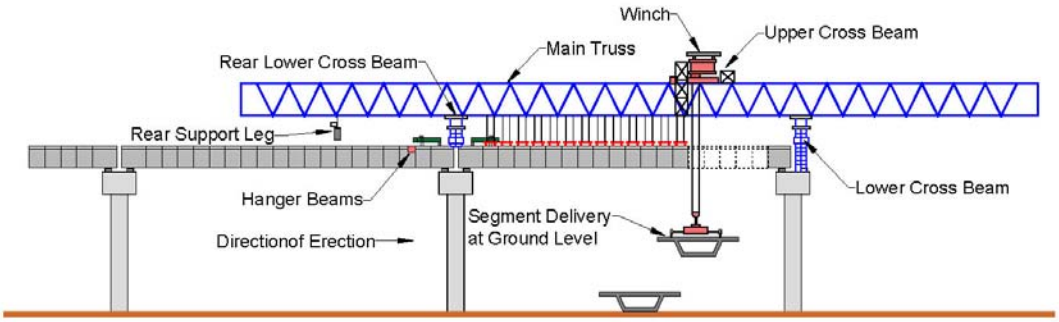

Figure 4-5 Precast Segmental Construction Schematic

The segment length is determined by the method of transport and the erection requirements. If the segments are transported using the existing ground infrastructure, each one is limited to a length of to 10 feet to 12 feet and weight of around 70 tons.

The typical construction sequence includes:

i. The substructure (foundations and columns) are constructed using traditional methods.

ii. The precast girder segments are precast in advance and stored in the precast yard.

iii. The launching gantry is set up and construction proceeds by progressively hoisting the segments and installing and tensioning the prestressing. A minimum of one span can be erected every four days.

iv. At locations where spans are cast-in-place on falsework or other construction method, the construction needs to be completed as an early item for the launching equipment to get across these areas without interrupting the construction process.

Figure 4-6 Precast Segmental Construction

The advantages of this construction method are:

- Fabrication of the box girder segments at the precast plant.
- Rapid assembly compared with other methods.
- Independent of the weather conditions.
- Segments are shipped by highway.

The disadvantages are:

- Weight and dimensions of the 70-ton segments requires the use of special carriers.
- Need to have a large precast plant that can adapt to the dimensions and necessary installation rate.
- Need to acquire special machinery for positioning the segments.
- Depend on two machines (one per direction); therefore, any faults or equipment failure could impact the overall schedule.
- Require a different method for spans that exceed 150 feet.
- Field work includes epoxying seams at the adjacent segments and post-tensioning the span prior to advancing the gantry.

The typical production rate for the precast segmental construction is estimated to be four days per span, as shown in Figure 4-7.

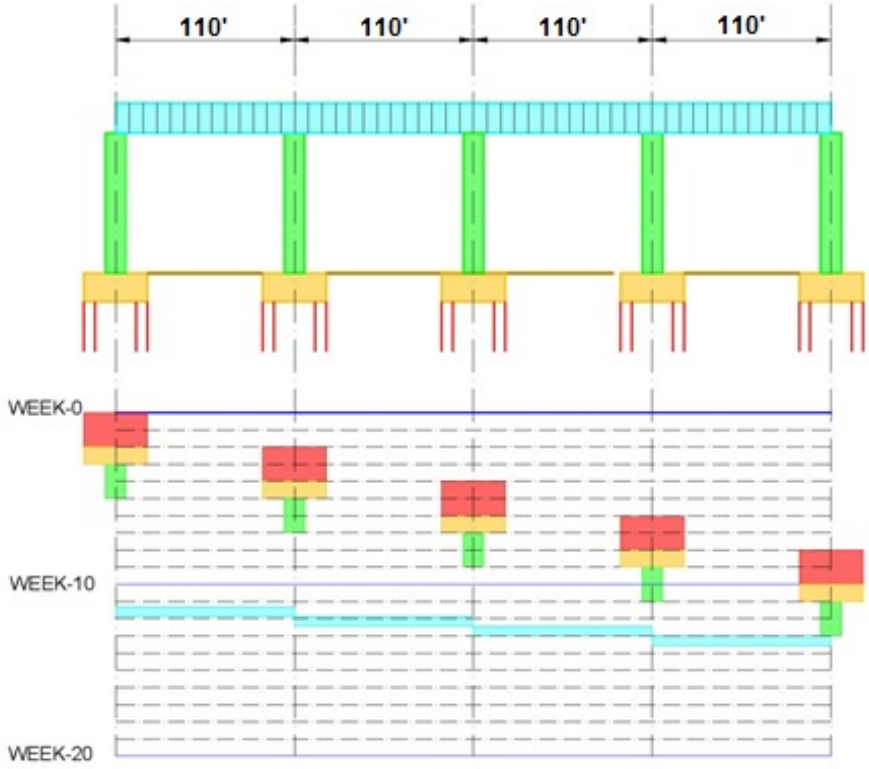

Figure 4-7 Precast Segmental Sequence and Production Rate

C. Balanced Cantilever (BC) Segmental Construction

In this construction method, segments are placed in a symmetrical fashion about a bent. This construction method is well suited for long span construction over existing facilities that prevent placing equipment and temporary supports on the ground. The cantilever tendons are located in the deck slab and are anchored at the ends of the segments. The midspan tendons are responsible for transferring the positive moment between two completed cantilevers.

In the precast BC construction method, the segments are precast off-site in a precast yard. A single cell box girder is preferred for precast construction to minimize the segment weight and to allow for a 3-point support under the webs during storage.

The segments are transported to the construction site and installed incrementally onto the existing portion of the cantilever. The erection can be performed by ground cranes hoisting devices located atop of deck or by a self-launching gantry. This method has more flexibility than the span-by-span segmental construction method because the span length can be increased without modifying the erection equipment.

In the CIP BC construction method, form travelers are used to form, reinforce, and cast a segment at the tip of the cantilever. Form travelers work in pairs (one at each end of the balanced cantilever) to maintain the balanced condition. The construction cycle takes up to one week from when the segment reinforcement is placed, concrete is cast, and the traveler advances to the next position. The segment length is typically longer than with precast segment construction because no transportation is required.

In both methods, temporary supports may be required to avoid over-stressing the bent column during erection.

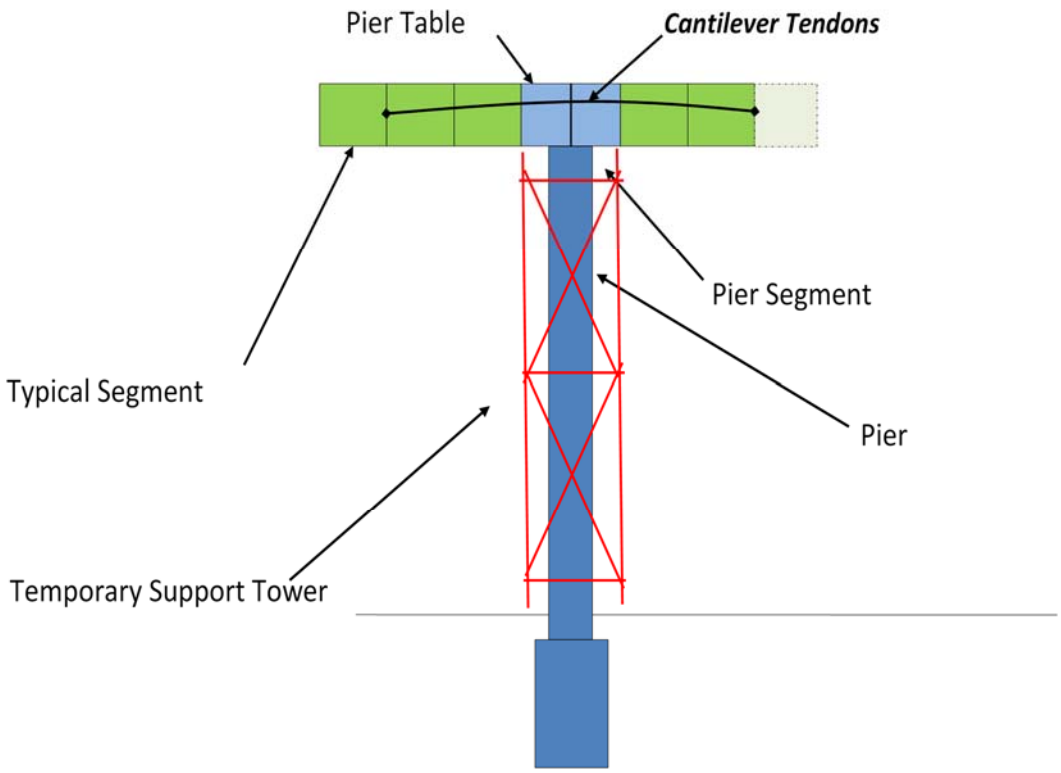

Figure 4-8 Balanced Cantilever Construction Components

Figure 4-9 Form Travelers and Temporary Supports in Balanced Cantilever Construction

The typical production rate for the balanced cantilever section is estimated to be 33 weeks per section, as shown in **Error! Reference source not found.** The rate of construction is conservatively assumed to be three weeks per segment.

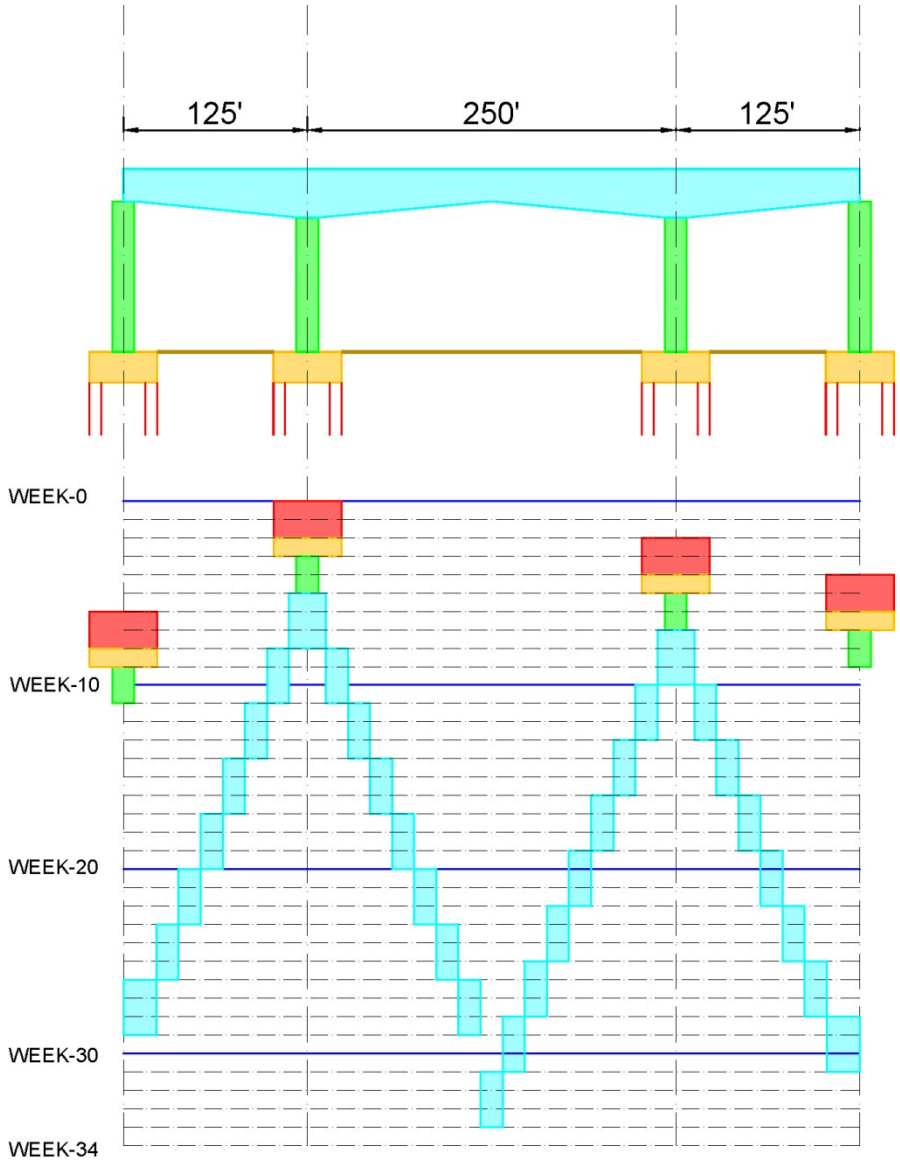

Figure 4-10 Balanced Cantilever Sequence and Production Rate

Appendix B includes illustrations of layout and space requirements for typical balanced cantilever construction at locations along the Monterey Highway Guideway.

D. Cast-in-Place (CIP) Construction on Falsework

Traditional Caltrans box girder construction is not feasible for the typical aerial spans due to the length of time required to erect the falsework. However, a method of CIP construction has been

used on HSR in other countries where a traveling formwork system is used. See Figure 4-11 Traveling Formwork System from HSR Tech Memo TM 2.3.3 Figure 3-12, for an example.

Figure 4-11 Traveling Formwork System from HSR Tech Memo TM 2.3.3 Figure 3-12

The typical construction steps include:

i. Construction of substructure using traditional methods.
ii. Advance the suspended formwork with either a launching girder or launching gantry.
iii. Lock the suspended formwork into position
iv. Place reinforcement and prestressing.
v. Pour concrete.
vi. Stress the prestressing.
vii. Strip formwork and advance to the next segment.

The estimated production rate for CIP concrete construction on falsework is two weeks per span, as illustrated in Figure 4-12 CIP Concrete Construction Sequence and Production Rate.

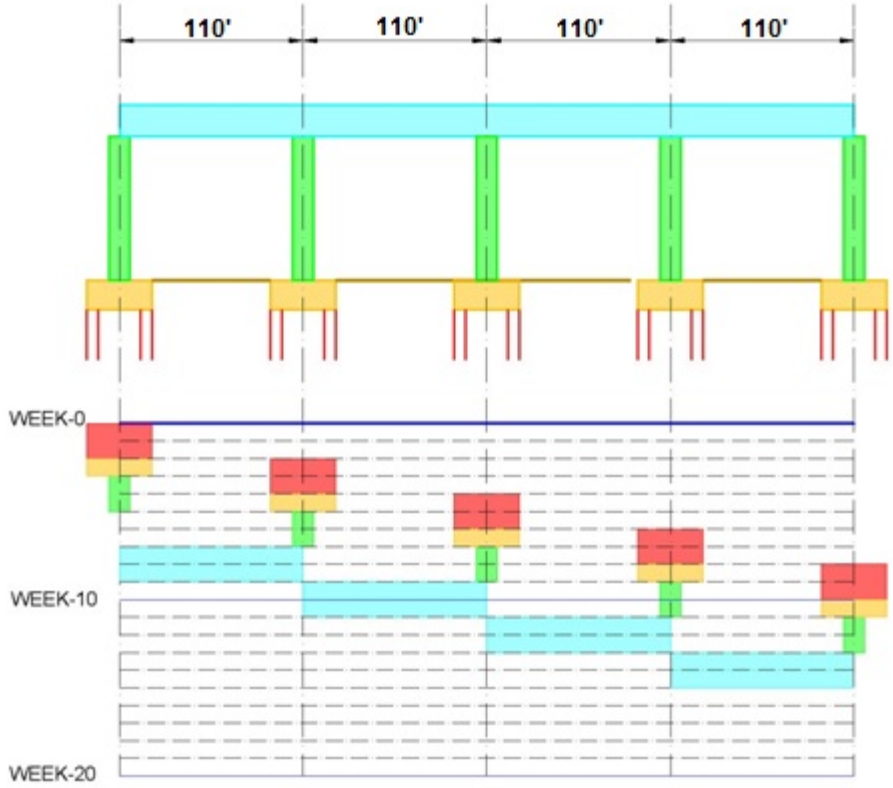

Figure 4-12 CIP Concrete Construction Sequence and Production Rate

E. Steel Plate Girder or Steel Truss

This type of structure is proposed for use only in special occasions when relatively long spans are required, and/or vertical clearance is limited. This type of structure can be considered during the 30% design when long spans are required, and a balanced cantilever structure becomes too deep, which can have a significant impact on the approach structure. This type of structure has high fabrication and maintenance cost in California.

4.6.2 Open-Trench Excavation

Open-trench construction is proposed to be CIP construction using temporary shoring and/bracing for deeper excavations and/or where ROW is limited. Secant pile or slurry construction can be recommended in places construction staging is an issue, or when next to structures and/or roadways sensitive to settling. This issue will be addressed at the 30% design level when the geotechnical exploration has been completed. The conventional CIP-shored construction has the advantage over the secant-pile construction to seal better when high-water table conditions exist.

The proposed structural system consists of a CIP cantilever concrete wall and invert slab. For deeper trenches, transverse precast pre-stressed struts will be used to reduce the demand on the cantilever walls and reduce wall width. Roadway trench crossings will consist of precast or CIP lids. For longer roadway crossings or under water bodies, cut-and-cover tunnels will be used.

Open trenches have the disadvantage of disrupting traffic going through the excavation. Traffic must be closed or detoured and/or relocated during the construction process. They also require

the relocation of underground utilities running perpendicular to the trench. Ground water management may be required depending on the depth of the water table. Also, this construction method may require temporary shoring/bracing during the construction process. Considerations to roadways nearby must be addressed to ensure settlement or undermining of the roadway is not occurring. Settlement and vibration monitoring is recommended during this process where construction is close to existing roadways and/or structures. Production rates can vary depending on the types of soils/rocks/obstructions encountered, types of equipment employed, and the contractor's means and methods.

4.6.3 Cut-and-Cover Tunnel

The construction method for cut-and-cover tunnels is similar to the open trench construction with the added component of constructing a CIP top slab to cover the trench. With cut-and-cover tunnels, roadway crossings will have to be detoured and/or closed during construction. Temporary diversion channels will need to be provided when tunnels cross through bodies of water. Construction staging is important to building cut-and-cover tunnels. Under certain circumstances, this type of construction is more cost effective than tunneling with tunnel boring machines.

4.6.4 Bored Tunnels

Bored tunnels are only considered when the length and depth of the tunnel allows it to be cost effective compared to the cut-and-cover construction. Bored tunnels are considered primarily for the Pacheco Pass Subsection. Construction considerations are addressed in the Conceptual Tunnel Design and Constructability Considerations for Pacheco Pass prepared by HNTB Corporation dated November 2017.

4.6.5 Retaining Walls

CIP retaining walls are anticipated where limited construction space is a concern. Production rates for casting retaining walls are estimated between 100 to 200 square feet per day.

Retained Earth Walls are anticipated in conjunction with retaining walls. Retained Earth Walls require straps or rods connected to the backside of the wall panels and are placed in the embankment for wall stability. Since the walls are placed as panels with the embankment, this method of construction expedites the overall embankment sequence. Production rates for these walls must be correlated to the production rates for placing embankment which is covered under the earthwork section. The walls require well-draining soils with no organics.

4.7 Track

At this stage of the project, a track system has not been selected. The design assumes conventional ballast track for at-grade alignments with the provision for ballastless or direct fixation track on the aerial viaducts/bridges, trenches, and tunnels.

Since the HSR must meet FRA Class 8/9 Track Standards, the construction methods and Track Tolerance Testing (FRA's Track Safety Standards Compliance Manual, Chapter 6) will follow 49 CFR 213 requirements for HSR. *Note:* Trackwork for the blended, at-grade alternative will meet standards for FRA Class 6 for operating speeds up to 110 mph.

A. Conventional Ballast Track

Worldwide, the most common system is the ballasted track system. This system includes the track roadbed, sub-ballast, ballast, ties, and rail with rail fasteners. Construction rates depend on the rail equipment and skilled team composition of the contractor. Mats can also be used with ballasted track to minimize vibrations.

Figure 4-13 Ballast Track - Schotteroberbau

Figure 4-14 Ballast Track with Mats - Japan

Figure 4-15 Ballast Track Turnouts

B. Direct Fixation or Slab Track System

This type of track system does not have any ballast in the Guideway. In its simplest form, this consists of a continuous slab of concrete (like a highway structure) with the rails supported directly on its upper surface (using a resilient pad). Variations include continuous in situ placing of a reinforced concrete slab or the use of pre-cast pre-stressed concrete units laid on a base layer. Units can be produced in casting yards with bridge/viaduct precast units and installed with them.

Figure 4-16 Slab Track - China HSR

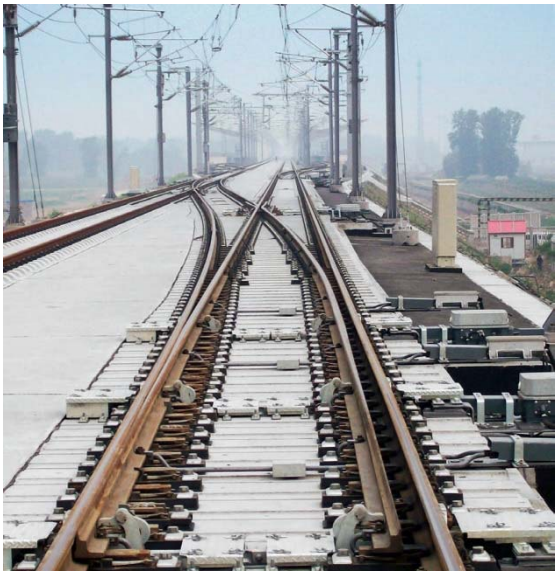

Figure 4-17 Track Turnouts - China HSR

C. Curve Straightening

The primary trackwork construction for the blended, at-grade alternative will be for curve straightening to allow for increased operational speeds on the corridor. This work has been categorized into four types of track shifts:

1. Less than one foot – Existing track is shifted in one work window and the existing OCS poles will remain.
2. More than one foot and less than 10 feet – Existing track is shifted over several work windows and the existing OCS poles will need to be relocated (via construction of new OCS poles to maintain existing operations during non-work windows).
3. More than 10 feet and less than 21.34 feet – New OCS poles and tracks are constructed alongside the existing tracks while allowing existing service to be maintained. Temporary OCS poles may be required where the existing OCS poles will need to be removed to construct the new track.
4. More than 21.34 feet – New OCS poles and tracks are constructed alongside the existing tracks while existing service will remain unaffected.

See Appendix H for additional information on track shift work and approach.

D. Vertical Alignment Adjustments

The existing track profile will need to be modified to allow for increased operational speeds on the corridor. With the assumption that the existing ballast layer is 18 inches deep, this work has been categorized into three types of vertical adjustments:

1. Raising or Lowering up to six inches – The track profile will be adjusted through changes to the ballast layer only. The sub-ballast layer would remain intact. The OCS poles can remain in place and only the contact wire would be adjusted.
2. Raising greater than six inches – The track profile will be adjusted through reconstruction of the trackbed (ballast and sub-ballast layers). The OCS poles will need to be reconstructed.
3. Lowering greater than six inches - The track profile will be adjusted through reconstruction of the trackbed (ballast and sub-ballast layers). The OCS poles will need to be reconstructed.

See Appendix H for additional information on track shift work and approach.

E. OCS Adjustments

The existing OCS system between CP Coast to south of the Caltrain Tamien Station will need to be modified based on the alignment modifications to allow for increased operational speeds on the corridor. This work has been categorized into four types of OCS modifications:

1. New OCS System – As noted above, based on the horizontal and/or vertical adjustment to the track profile, new OCS poles will need to be constructed.
2. OCS Pole Displacement – As noted above, based on the horizontal and/or vertical adjustment to the track profile, new OCS poles will need to be relocated.
3. OCS Contact Wire Displacement - As noted above, based on the horizontal adjustment to the track alignment, the OCS contact wire would be adjusted, and the existing OCS pole would remain.
4. OCS Contact Wire Vertical Displacement - As noted above, based on the vertical adjustment to the track profile, the OCS contact wire would be adjusted, and the

existing OCS pole will need to be reconstructed if the adjustment was more than could be accommodated on the existing pole.

See Appendix H for additional information on OCS adjustments and approach.

4.8 Utility Relocations/Adjustments/Construction

Since the HSR alignments traverses developed urban areas and farmland, existing utilities such as water supply facilities, etc., are anticipated to be constructed during the site preparation stage. Detailed information for utility relocations/adjustments is contained in the High Risk and Major Utilities Conflict Memorandum. Schedule and contract arrangements will need to be developed for utility relocation; oil pipelines, high pressure gas lines, major irrigation, fiber optic, water mains, and wells.

5 SUBSECTION CONSTRUCTION

Specific subsection construction challenges and issues are described in this section. The engineering drawings will provide construction staging and phasing plans. The drawings will also underline how some of the constructability issues are proposed to be resolved.

5.1 San Jose Diridon Station Approach

5.1.1 Alternative 1

This is an aerial structure option to build the San Jose High-Speed Station over the existing Caltrain San Jose Diridon Station with a connection between both stations through an intermediate mezzanine.

The HSR alignment begins to rise at station 2403+00 with the aerial structure beginning at station 2415+00 and continuing into the next section.

The structure is composed of an initial stretch on retained fill and a second one supported by a viaduct, including a 450-ft. long span over the Guadalupe Freeway. Different construction methods will be used, such as CIP, precast, or BC. This viaduct will pass over existing facilities allowing them to maintain their functionality. See Appendix D for a possible constructability process.

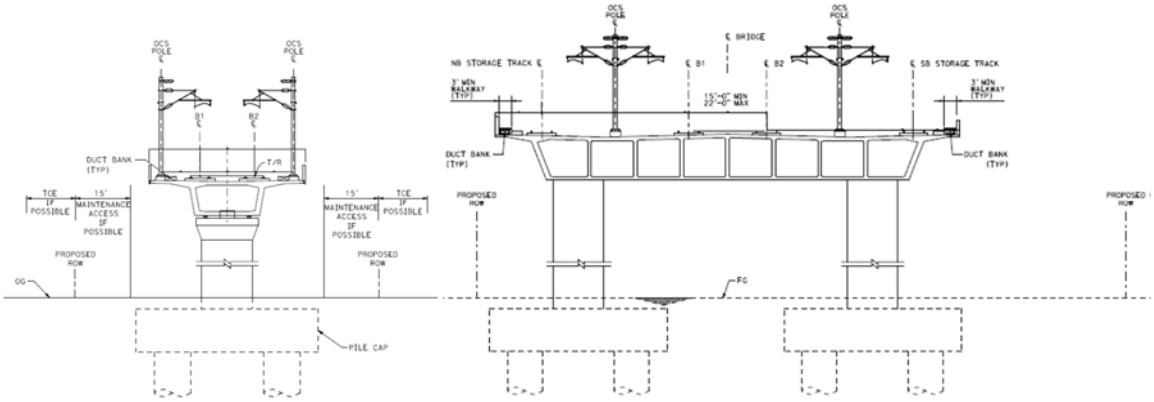

Figure 5-1 Typical Section in Subsection San Jose Diridon Station Alternative 1

Immediately following the San Jose Diridon Station, the HSR alignment continues on a viaduct over I-280 and SR-87. Viaduct foundations and columns within the highway median and shoulders will be required and consequently temporary traffic controls will be needed during the construction process. See Appendix F for possible construction sequences for the columns located with the I-280 median and shoulders.

5.1.2 Alternative 2

This alternative is structurally similar to Alternative 1, with the main difference being a longer structure length beginning at station 2288+00.

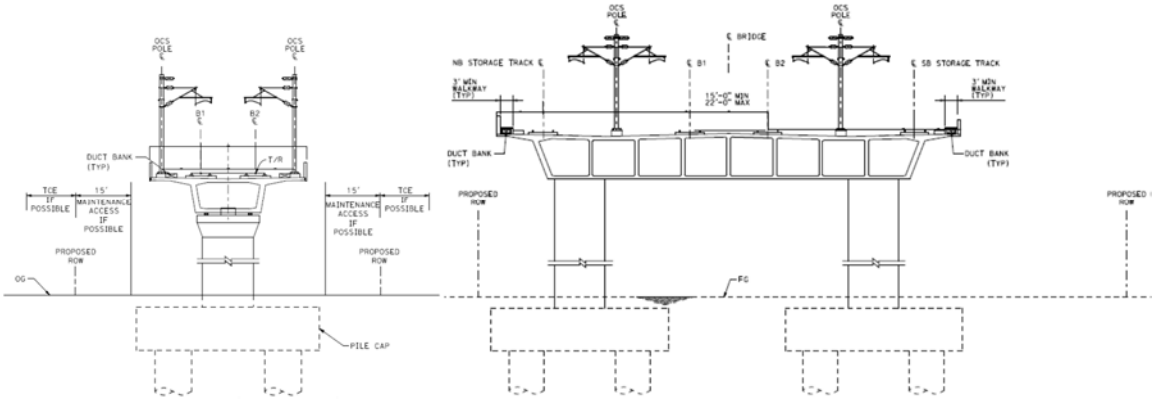

Figure 5-2 Typical Section in Subsection San Jose Diridon Station Alternative 2

For both Alternatives 1 and 2, temporary traffic controls will be required on the local roadways to construct the HSR. In some instances, significant changes to the local street movement, such as two-way traffic control or full street closures and detours will be required. Coordination with the City of San Jose will be required in the next project phase to develop detailed traffic management plans.

5.1.3 Alternative 4

This is a blended at-grade alternative to build the San Jose HSR Station at-grade within the existing Caltrain San Jose Diridon Station by raising and extending two existing platforms, and constructing a pedestrian overcrossing to connect the station building to the HSR platforms.

South of the San Jose Dirdion Station, the track alignment will follow the existing Caltrain corridor and add a third track from Los Gatos Creek to the Caltrain Tamien Station. The alignment is on retained fill to minimize the need for additional ROW. Some of the existing structures will be replaced where shifting of the track or a change in the track profile will preclude use of the existing structure. There will be new single-track structures over I-280 and SR87 (Guadalupe Freeway). The construction of the structure over SR87 will require single-track operations of the VTA light rail system between the Tamien and Virginia stations. Different construction methods for these new structures will be used, such as CIP, precast, or BC. See Appendix D for a possible constructability process.

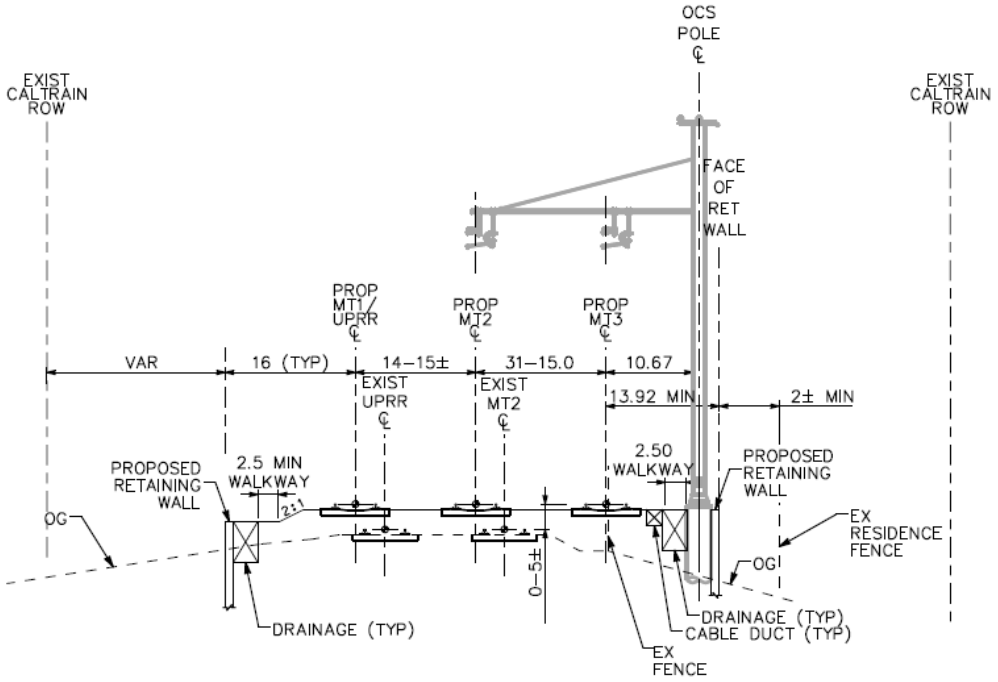

Figure 5-3 Typical Section South of I-280 in Subsection San Jose Diridon Station Alternative 4

Viaduct foundations and columns within the highway median and shoulders will be required and consequently temporary traffic controls will be needed during the construction process.

5.2 Monterey Corridor

Three different alternatives are designed for the Monterey Corridor: 1) an at-grade/embankment alignment adjacent to the existing UPRR ROW, 2) an aerial alignment adjacent to the existing UPRR ROW, and 3) a blended, at-grade alignment within the existing UPRR ROW.

Each alternative has its own alignment and construction methods that should be adapted to their surrounding conditions.

5.2.1 Monterey Corridor At-Grade/Embankment (Alternative 2)

This section alignment runs parallel to and in between Monterey Road and the UPRR railway line with cut-and-fill slopes, retaining walls, and intrusion barriers as required. This subsection includes several roadway grade separations that are both over- and undercrossings.

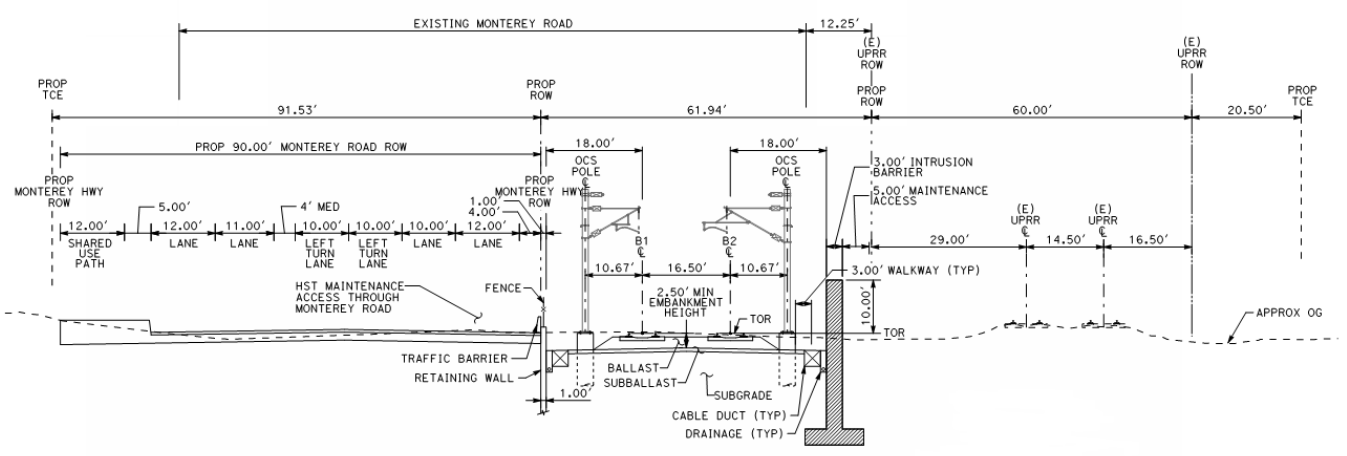

Figure 5-4 Typical Section in Subsection Monterey Corridor (At Grade)

Due to site constraints and the need for Monterey Road and UPRR to maintain operations, it is assumed that the construction process will begin with the relocation of existing utilities, then the construction of Monterey Road and the grade separations, and then the construction of HSR structures and facilities including retaining walls and bridges. In general, shoofly tracks will be constructed near the HSR tracks for UPRR use during construction of the UPRR bridge at undercrossing locations. Then, the final HSR bridge and tracks will be constructed after the UPRR permanent alignments are restored. For construction staging sequencing at the grade separations see the plan sets in the March 2019 PEPD submittal.

5.2.2 Monterey Corridor Viaduct (Alternative 1)

This is an elevated alignment which generally runs within the Monterey Road median and is supported by a 2-track girder box. The viaduct structure deck should be precast for 110 ft. spans and BC for larger spans.

Due to the viaduct foundation dimensions, the adjacent roadway areas must be temporarily occupied during the construction process so temporary traffic control measures will be required. One possible process would be to construct the viaduct foundations in three stages to maintain two lanes of traffic in each direction. Dedicated left-turn lanes would be eliminated during the process (to stay within existing ROW), but major, signalized intersections would remain open. Nighttime work involving lane closures resulting in one lane of traffic in each direction may also be utilized. See Appendix G for conceptual plans.

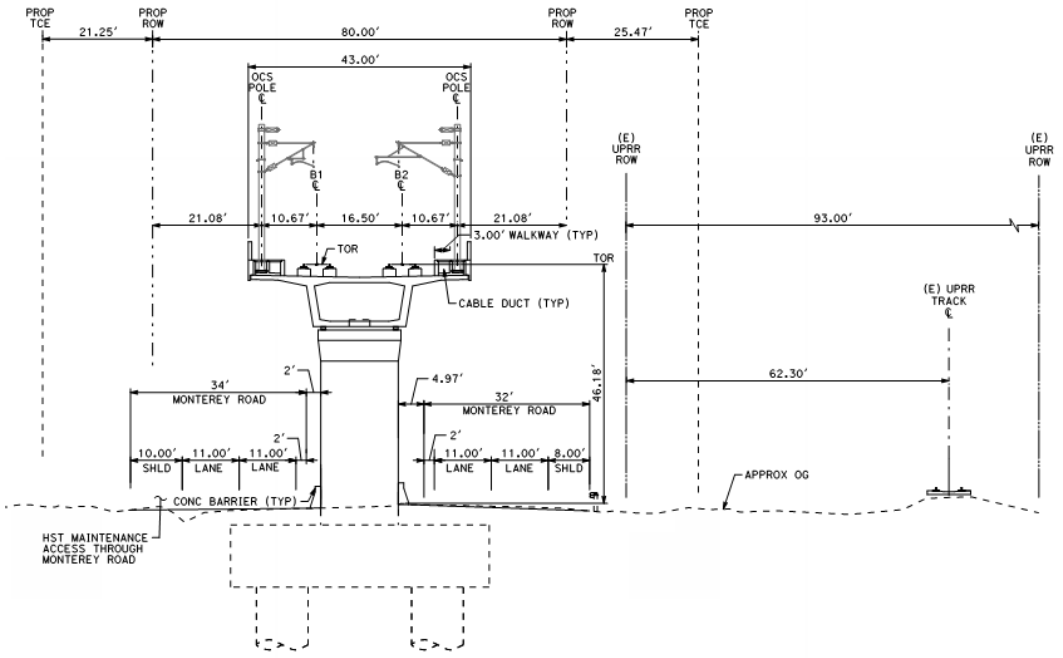

Figure 5-5 Typical Section in Subsection Monterey Corridor (Viaduct

5.2.3 Monterey Corridor Blended At-Grade (Alternative 4)

This section runs at grade and parallel alongside Monterey Road through San Jose. It is in the UPRR ROW so temporary traffic handling measures are minimal. UPRR and Blended/HSR tracks are substantially within the existing UPRR ROW.

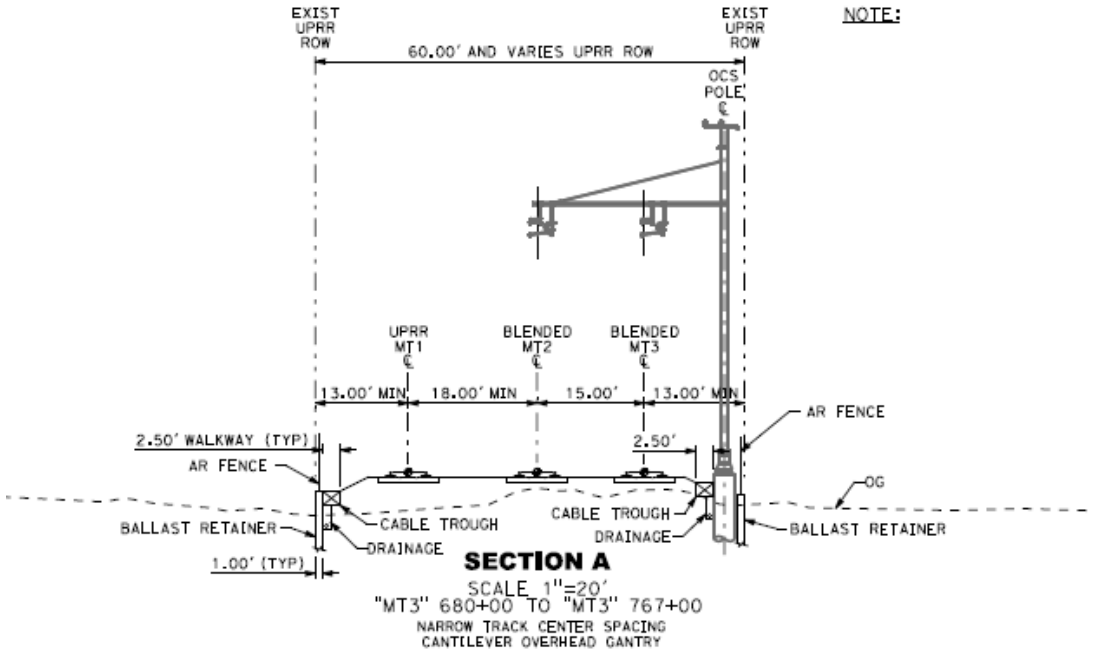

Figure 5-6 Typical Section in Subsection Monterey Corridor (Blended At-Grade)

The assumed construction process is retaining walls/ballast retainers, UPRR trackbed construction, single/UPRR track shifting or new track construction, blended track construction, and associated roadway construction (paving, etc.) at the at-grade crossings.

In areas of curve straightening outside the existing UPRR ROW, the assumed construction process is:

- Demolition
- Retaining wall construction
- UPRR track construction
- Blended track construction

5.3 Morgan Hill and Gilroy

This is a long stretch where four alternatives are studied.

5.3.1 Viaduct to Downtown Gilroy (Alternative 1)

This subsection continues the viaduct from the Monterey Corridor Viaduct subsection all the way to the Downtown Gilroy Station. As in the previous section, the alignment runs along the Monterey Road median then deviates to the east towards U.S.101 and runs parallel to the freeway for approximately four miles through Morgan Hill. The alignment turns back to the west to run parallel with Monterey Road again until the Downtown Gilroy Station. Following the station, the alignment continues on a viaduct, passing over U.S. 101. Following the viaduct, the alignment runs on an embankment where the Gilroy MOWF is located.

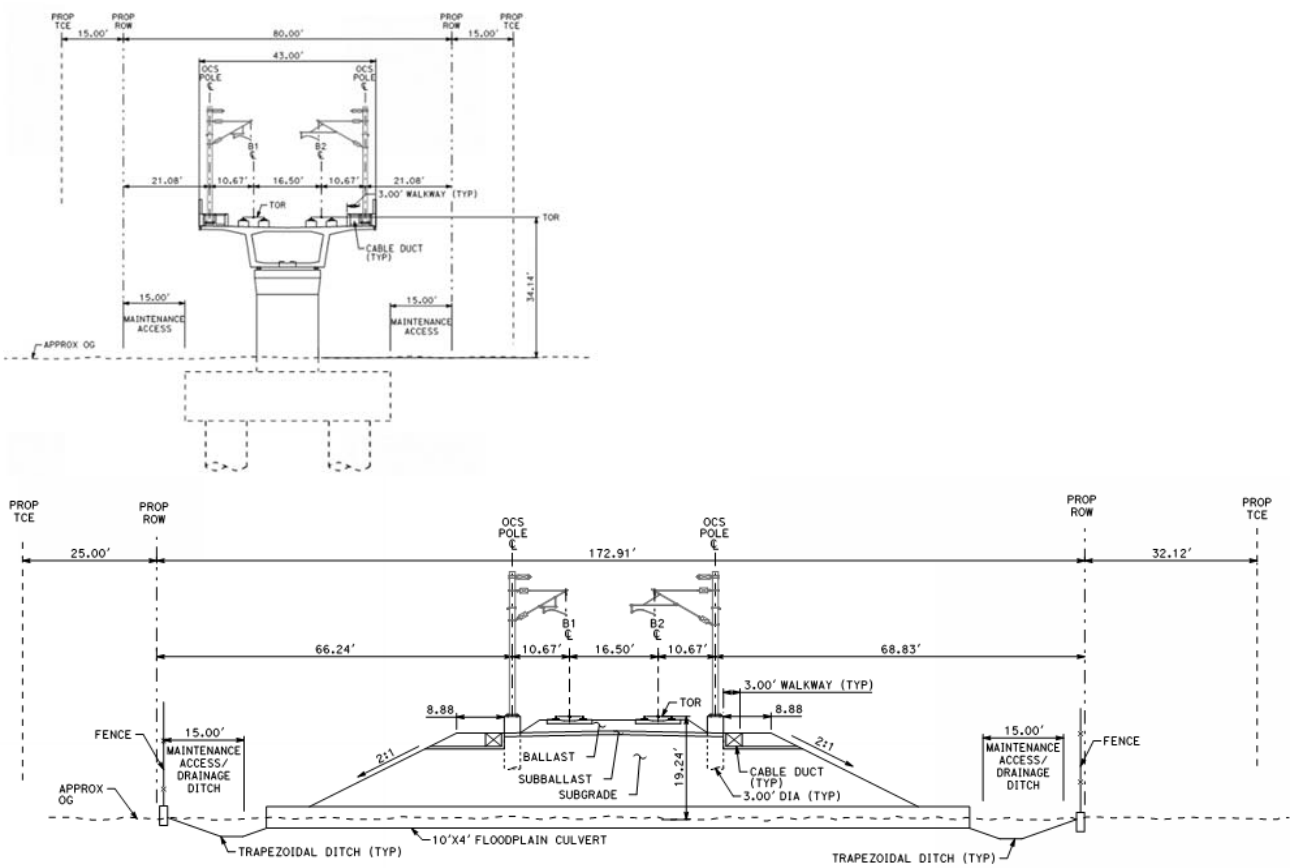

Figure 5-7 Typical Sections in Subsection Morgan Hill and Gilroy (Viaduct)

There are different construction methods assumed for this section.

At the beginning, where the HSR alignment is over roadway median, the median will be redesigned to accommodate the viaduct foundations. The foundation dimensions will encroach into the roadway lanes, so temporary traffic handling measures will be required for the construction process.

Within Morgan Hill, where the alignment deviates to the east, no roadways are affected and some buildings will need to be demolished before beginning construction.

It is assumed the viaduct will be constructed using standard methods and decks will be precast except at long spans where BC is assumed.

For purposes of discussion, the following provides an overview of probable construction activities and durations for the long viaduct.

- The total elevated viaduct structure for this segment is approximately 138,000 feet long, composed of several different structure types:
    - Typical Spans (110 feet long), approximately 1,185 spans total
    - Longer Spans (up to 150 feet long), approximately 30 spans total
    - Balanced Cantilever Spans (up to 410 feet long), approximately 47 spans total
    - Straddle Bent Spans (900 feet total length) crossing UPRR
- Factors that affect the viaduct work and control the construction schedule include:
    - Ordering, fabricating, delivery, and setup of specialized gantries used for installing the full span precast girders and establishment of the precast yards, including equipment procurement, operations startup, and production rates. It is estimated that two precast yards will be needed for the Monterey Highway Aerial Structure (1-1/2 years).
    - Construction of 1,266 foundations and columns: 11,394 days (based on nine days per foundation using CIDH and columns) of total construction time, assuming completion in 3-1/4 years with 10 teams.
    - Estimate that two gantries will be needed for the entire Monterey Highway Aerial Structure to achieve the 2-year construction schedule (based on 1 span per day per gantry).
    - Scheduling the completion of the balanced cantilever spans and straddle bents prior to advancing the gantries over those locations.
    - It is estimated that 3.5 years will be needed for the Monterey Highway Aerial Structure.

The remaining part of the section involves the construction of large embankments, which requires drainage/floodplain control measures and short viaducts to allow water flow.

5.3.2 Embankment to Downtown Gilroy (Alternative 2)

This section runs at grade parallel alongside Monterey Road through Morgan Hill. It is placed between UPRR tracks and Monterey Road so temporary traffic handling measures will be needed. UPRR and HSR tracks are separated by a concrete retaining wall.

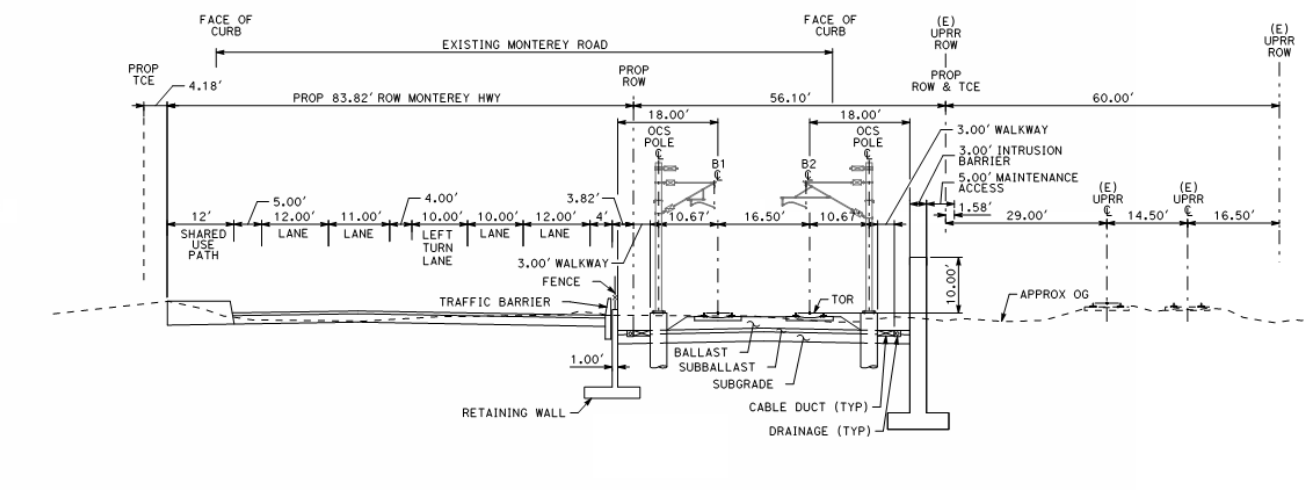

Figure 5-8 Typical Sections in Subsection Morgan Hill and Gilroy (Embankment)

The assumed construction process is temporary traffic handling measures, then retaining walls, and finally the HSR embankment and required structures.

Through Gilroy, the alignment is no longer alongside Monterey Road except where it crosses the roadway.

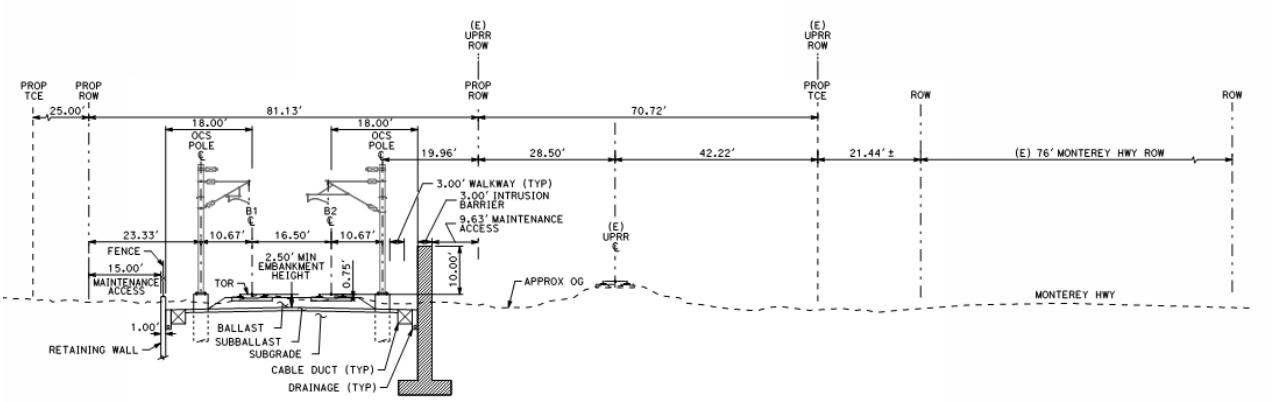

Figure 5-9 Typical Sections in Subsection Morgan Hill and Gilroy (Embankment)

The assumed construction process is:

- Demolition
- Monterey Road/crossing roadway temporary traffic measures
- Retaining wall construction
- HSR track construction

The HSR Downtown Gilroy Station will be built above the existing Gilroy Station and it will be elevated, so walls will be needed to retain the embankment. Following the station, the alignment passes under U.S.101 through a combination trench and cut-and-cover structure. Following the trench, the alignment runs on an embankment where the Gilroy MOWF is located.

Under U.S.101, the track section will be a cut-and-cover trench and will require reconstruction of the highway bridges. It is anticipated that major temporary traffic control measures will be needed, such as (but not limited to):

- Construction of temporary highway bridges to divert the northbound and southbound traffic off the existing bridges during bridge construction.
- Shifting one direction of traffic to the other, to share an existing bridge with a reversible lane.

A future design phase will develop and finalize the stage construction plans in coordination with Caltrans. The remaining part of the section involves the construction of large embankments, which requires drainage/floodplain control measures and short viaducts to allow water flow.

5.3.3 Viaduct to East Gilroy (Alternative 3)

This subsection follows the same alignment and design as the Viaduct to Downtown Gilroy until station 1337+49 where the alignment deviates to the east, crosses U. S. 101, and continues to the East Gilroy Station location. Following the station, the MOWF is located on an embankment before the Pacheco Pass tunnels. Construction methods and processes are assumed to be the same as the Viaduct to Downtown Gilroy section.

5.3.4 Blended At-Grade to Downtown Gilroy (Alternative 4)

This section runs at-grade and parallel alongside Monterey Road through Morgan Hill. It is in the UPRR ROW, so temporary traffic handling measures are minimal. UPRR and Blended/HSR tracks are substantially within the existing UPRR ROW.

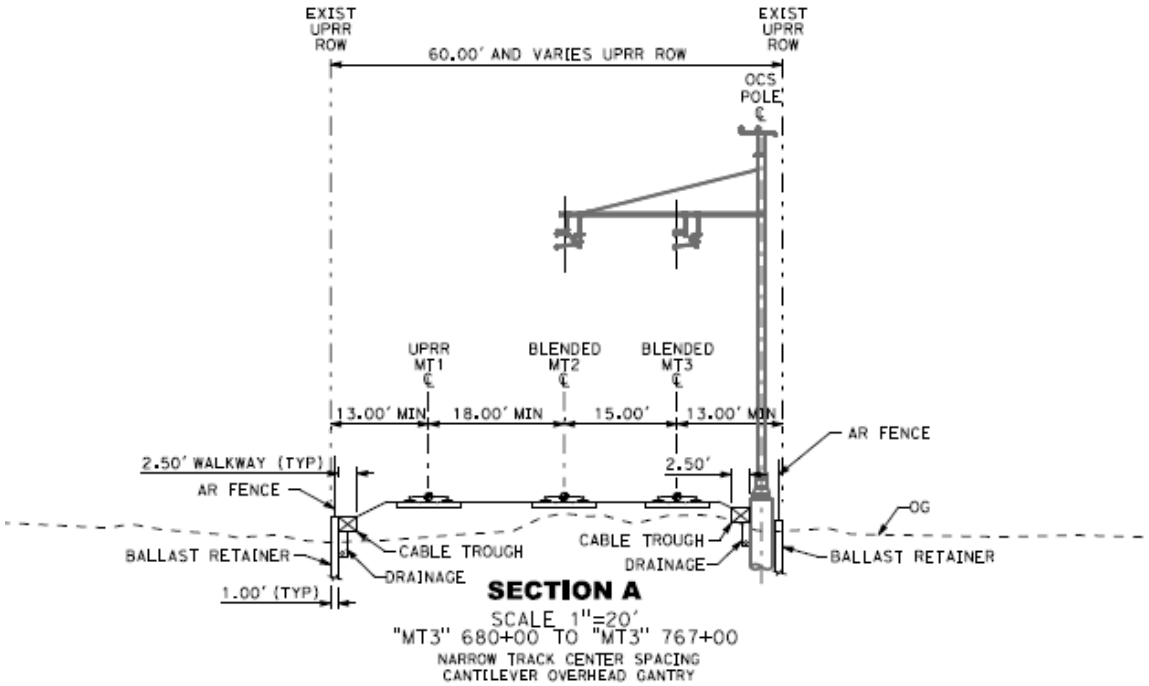

Figure 5-10 Typical Section in Subsection Morgan Hill and Gilroy (Blended At-Grade)

The assumed construction process is retaining walls/ballast retainers, UPRR trackbed construction, single/UPRR track shifting or new track construction, blended track construction, and associated roadway construction (paving, etc.) for the at-grade crossings.

In areas of curve straightening that is outside the existing UPRR ROW, the assumed construction process is:

- Demolition
- Retaining wall construction
- UPRR track construction
- Blended track construction

The HSR Downtown Gilroy Station will be at-grade and built on the existing Gilroy Station tracks and platforms. Following the station, the alignment passes under U.S.101 on the existing tracks. Following south of U.S.101, the UPRR tracks will be realigned with the HSR alignment running on an embankment where the Gilroy MOWF is located.

No impacts are expected to U.S.101.

5.4 Gilroy and Pacheco Pass Tunnels (Alternatives 1-4)

There are two HSR alignments for the area in southern Gilroy through Pacheco Pass, both include two tunnels. The only difference between the two alternatives is the alignment of Tunnel 1, with the first alternative coming from Downtown Gilroy and the second alternative coming from East Gilroy. Both alternatives have the same east portal location for Tunnel 1.

The tunnels lengths are as follows:

Table 5-1 San Jose to Merced Tunnel Lengths

TUNNEL 1		
TUNNEL 1 - DOWNTOWN GILROY ALIGNMENT		
PORTAL 1	PORTAL 2	TUNNEL LENGTH (ft)
2252+02.00	2339+16.00	8,714
TUNNEL 1 - EAST GILROY ALIGNMENT		
PORTAL 1	PORTAL 2	TUNNEL LENGTH (ft)
2184+53.00	2268+86.00	8,433
TUNNEL 2 - DEEP ALIGNMENT		
PORTAL 1	PORTAL 2	TUNNEL LENGTH (ft)
3322+62.00	4034+00.00	71,138

Both tunnels have typical sections with 28 foot interior diameters. Track centerline distances vary: Tunnel 1: 66 ft. apart and Tunnel 2: 132 ft. apart.

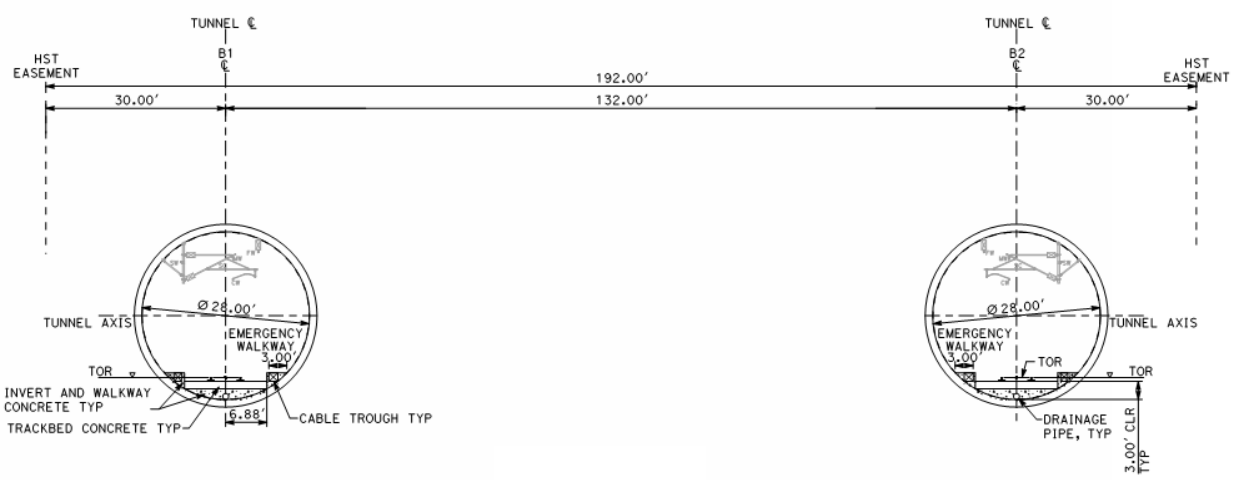

Figure 5-11 Typical Sections in Subsection Pacheco Pass (Tunnel)

Constructability considerations are addressed in the Conceptual Tunnel Design and Constructability Considerations – Pacheco Pass Report.

A large level area will be constructed at each tunnel portal, first to be used as a working area during construction and then as a permanent area for tunnel facilities. The portal areas will require walls to limit significant grading and slope work.

A key characteristic of this section is the alignment runs along a very rugged area, so there are numerous structures and major earthwork areas required outside of the tunnel limits. This includes an area necessary to install a significant cut slope to construct a viaduct.

5.5 San Joaquin Valley (Alternatives 1-4)

This subsection was studied for at-grade construction and aerial structures. At-grade construction will require elevating existing roadways and providing additional fill material for the embankments leading to the roadway bridge approaches. Detours or temporary diversions of existing streets would be required while roadway and bridge construction progressed. Phasing of road construction should be sequenced to construct the roadway overpass before the HSR alignment. This is the most efficient method to save on costs and time. After completion of the individual roadway overpasses, this portion of the HSR could be constructed without interruption.

The aerial structure is proposed as a full-span precast construction method using simply supported precast 120 foot girders. The superstructure would consist of typical 120-foot-long pre-stressed concrete, single-cell concrete box girders supporting two parallel train tracks. Direct fixation track configuration is assumed, saving in weight and therefore seismic demand over the ballasted track alternative.

For the purposes of this report, a 14-foot diameter single-shaft foundation was found competitive and was selected due to installation speed compared to a pile cap system. The final foundation system will be selected depending on actual soil conditions, final seismic design response, and contractors' equipment availability as well as speed of construction.

Assuming the design of the gantry/equipment takes six months, its manufacture another six months, and final assembly at the site takes three months, the gantries will be available to launch girders 1-1/2 years after notice to proceed was issued to the contractor.

With the alternative alignments, bridge lengths will vary. For the purposes of this report, one option from Henry Miller Road to Carlucci Road is considered to provide a basis for scheduling.

Structures total length is 26,943 feet, so estimated working timetables are:

- Gantry/equipment design, procurement, assembly: 1-1/2 years
- 120 foot spans for 26,943 feet of bridge with approximately 225 foundations: 2,025 days of total construction time (based on nine days per foundation using CIDH and columns), assume completion in 405 days with five teams.
    - Spans per day was estimated in Section 4. General Construction Methods. Substructure construction must be complete before the superstructure can begin and with an assumed lag time of 100 days between the start of substructure work to the start of superstructure work, it is estimated that the entire 26,943 foot bridge would take approximately 205 days to complete.

Other specific constructability concerns in the San Joaquin Valley Crossing subsection include:

- Major waterway crossings including large irrigation canals and:
    - San Luis Creek
    - San Luis Wasteway
    - Los Banos Creek
    - San Luis Drain No. 1
    - Mud Slough
    - Boundary Drain
    - Devon Drain
    - Drain #1
    - West Delta Drain
    - Poso Drain
    - Belmont Drain
    - West San Juan Drain
    - West San Juan Drain #1
- Minimizing disturbances in Caltrans ROW
- Spanning across I-5 and Whitworth Road
- Maintaining access for agricultural operations
- Interface between San Joaquin Valley Crossing and Merced to Fresno Wye

6 CONSTRUCTION STAGING AREAS

The construction staging areas will house: incoming materials; areas for material preparation, storage and maintenance of equipment, operations preparation, and construction offices; and allow good housekeeping throughout the alignment (see the plans for all the construction staging areas).

Each method of construction will have its own staging area requirements. Staging areas for span-by-span segmental, BC, and CIP construction methods are not as critical to the construction footprint as the full span method for the following reasons, the site does not need to be as large and bridge elements can be transported to/from the site using local streets. On the other hand, staging areas for methods other than full span construction impact local roads more in terms of lane closures and detours. The larger construction staging areas (for use as viaduct pre-casting yards) for Alternatives 1 and 3, as well as limited construction staging areas available for Alternative 4 are shown below.

6.1 Monterey Viaduct Alignment Using Full Span Construction

6.1.1 Location

Figure 6-1 Far North End Staging Area, Alternatives 1 and 3 (Sta 310+00 near Capitol Caltrain)

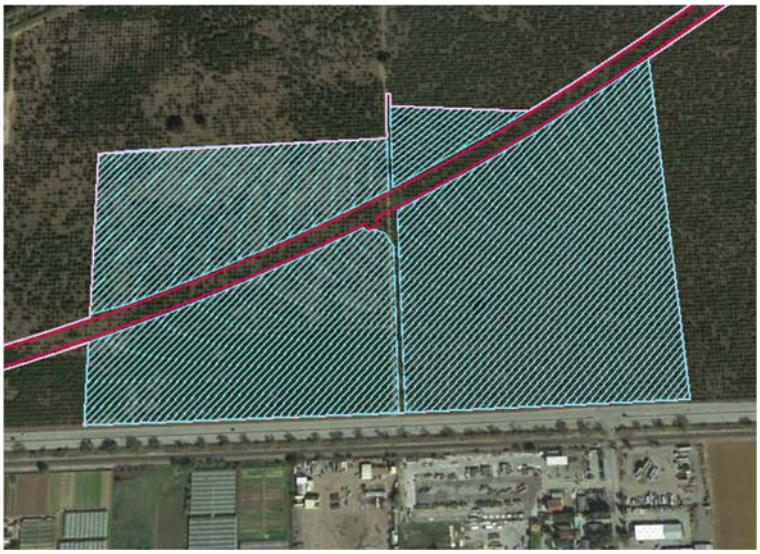

Figure 6-2 Central Staging Area, Alternatives 1 and 3 (Sta 920+00 near Morgan Hill)

Figure 6-3 South End Staging Area, Alternative 1 (Sta 1575+00 in Gilroy)

Figure 6-4 South End Staging Area, Alternative 3 (Sta 1605+00 in Gilroy)

6.1.2 Description of Site

Three in-line staging areas are shown in Section 6-1:

- Figure 6-1 Far North End Staging Area, Alternatives 1 and 3 (Sta 310+00 near Capitol Caltrain)
- Figure 6-2 Central Staging Area, Alternatives 1 and 3 (Sta 920+00 near Morgan Hill)
- Figure 6-3 South End Staging Area, Alternative 1 (Sta 1575+00 in Gilroy)
- Figure 6-44South End Staging Area, Alternative 3 (Sta 1605+00 in Gilroy)

The alignment between the Far North End and South End staging areas is constrained because the HSR alignment runs between the UPRR ROW and Monterey Highway.

6.1.3 Criteria Compliance

Each of the three staging areas comply with the criteria required for the full-span precast construction method: in-line with the HSR alignment and at least 35 acres. The 35 acres includes 21 acres for the precast yard (see Appendix C) and 14 acres for the movement of precast spans onto the alignment.

6.1.4 General Size, Shape, Location

- Far North End staging area (Alternatives 1 and 3)
  - 67 acres
  - In San Jose near the Capitol Caltrain Station (Sta 310+00)

- Central staging area (Alternatives 1 and 3)
  - 78 acres
  - In Morgan Hill (Sta 920+00)
- South End staging area (Alternative 1)
  - 36 acres
  - In Gilroy (Sta 1575+00)
- South End staging area (Alternative 3)
  - 38 acres
  - In Gilroy (Sta 1605+00)

6.1.5 Site Summary

Each of the in-line staging areas are already impacted to a certain extent from the HSR alignment itself. Expanding the site to include a staging area will have the following additional impacts.

- The Far North End staging area would displace several businesses including an auto wrecker.
- The Central staging area encompasses mainly undeveloped area but does include several residences. A nearby alternate site could be located adjacent to Monterey Road.
- The South End staging area (Alternative 1) encompasses a mainly undeveloped area adjacent to UPRR railway and Monterey Highway.
- The South End staging area (Alternative 3) encompasses a mainly undeveloped area between Cohansey and Las Animas avenues east of U.S.101.

6.2 Blended At-Grade Alignment Construction

6.2.1 Location

Figure 6-5 Coyote Valley Staging Area, Alternative 4 (Sta 795+00 near Bailey Avenue)

Figure 6-6 San Martin/Upper Llagas Creek Staging Area, Alternative 4 (Sta 1290+00 near south end of Morgan Hill)

6.2.2 Description of Site

Two in-line staging areas are shown for Alternative 4 in this section (see 6.2.1, Figures 6-5 and 6-6). The alignment for Alternative 4 has been designed to stay within the existing UPRR ROW to the greatest extent possible to minimize the need for additional ROW acquisition. The Coyote Valley Staging Area is the northernmost location possible (used as a temporary construction easement) while the San Martin/Upper Llagas Creek Staging Area is located where there is curve straightening outside the existing UPRR ROW. The MOWF just south of Gilroy could also be used as a staging area since it is within the permanent HSR ROW (however, this location is not shown as a potential construction staging area).

6.2.3 Criteria Compliance

The Coyote Valley staging area is suitable for staging construction materials associated with the blended, at-grade construction elements (track, ballast, ties, ballast retainers, etc.). The San Martin/Upper Llagas Creek staging area is limited to the parcel acquired for the curve straightening of the alignment. There are no minimum size requirements for these areas in Alternative 4.

6.2.4 General Size, Shape, Location

- Coyote Valley staging area (Alternative 4)
  - 6 acres
  - Near Bailey Avenue (Sta 795+00)
- San Martin/Upper Llagas Creek staging area (Alternative 4)
  - 4 acres
  - South of Morgan Hill (Sta 1290+00)

6.2.5 Site Summary

Each of the in-line staging areas are already impacted to a certain extent from the HSR alignment. Expanding the site to include a staging area will have the following additional impacts.

- The Coyote Valley staging area encompasses undeveloped agricultural land adjacent to the existing UPRR ROW.
- The San Martin/Upper Llagas Creek staging area is whole parcel of a business (RV storage) that would be impacted as a result of the curve straightening of the alignment (Alternative 4).

7 PRECASTING OPERATIONS AND YARD REQUIREMENTS

The approximate dimensions of a typical precast yard take into account the following elements and associated space requirements:

- Beam Manufacture and Casting Beds
- Concrete Manufacture
- Steel Storage
- Beam Storage
- Heavy Equipment Parking
- Administration Building & Staff Parking
- Access Road

A typical precast yard with estimated size requirements for each element is shown as follows:

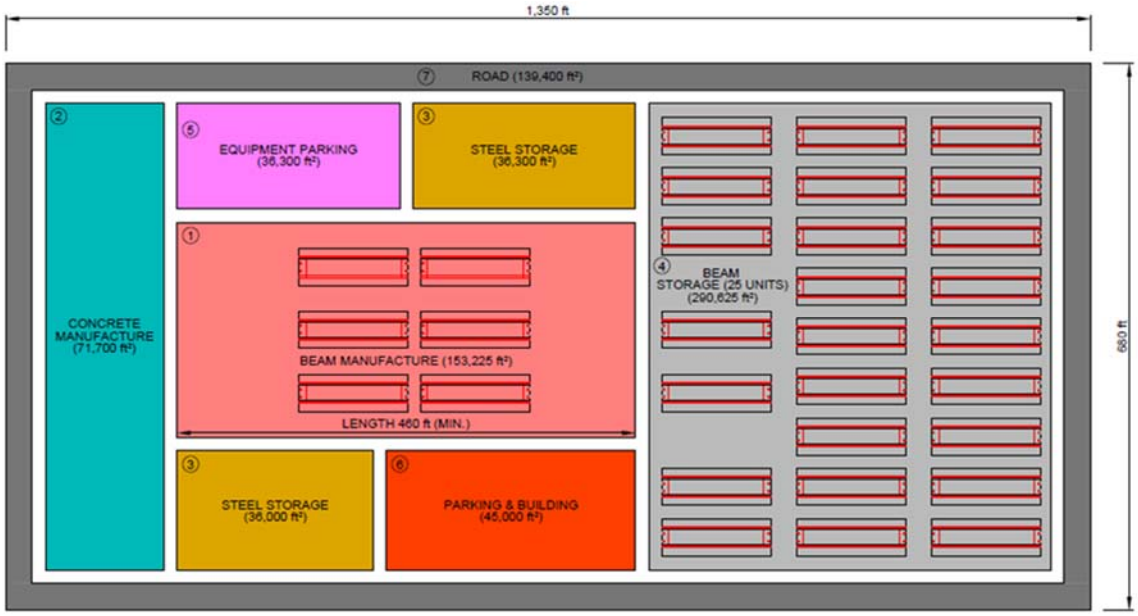

Figure 7-1 Precast Yard Layout

To meet the 2-1/2-year construction schedule, two precast yards will be needed to produce the spans for the 142,800-foot-long Monterey Highway Viaduct Structure.

Appendix C includes detailed information about each of the precast yard elements, estimated sizes, and layout.

8 CONSTRUCTION SEQUENCING

8.1 Construction Timing Constraints

Environmental constraints, including nesting bird season and seasonal flooding, can constrain the timing of certain construction activities. Tree removal would ideally be conducted during the non-breeding season to avoid potential impacts to actively nesting birds. Dewatering for foundation construction in sensitive areas may be restricted to dry months.

Key activities that may constrain the construction schedule and impact the critical path if not properly sequenced include:

- ROW acquisitions (permanent and temporary)
- Utility relocations
- Railroad realignment
- Roadway rerouting
- Order and delivery of long lead items.

Critical path construction activities include:

- Standard viaduct construction – setting up staging areas and precasting facilities

8.2 Enabling Works

Enabling works include:

- ROW acquisition.
- Obtaining necessary construction permits.
- Setting up staging areas and precasting facilities.
- Setting up worker health, safety, and welfare facilities.
- Setting up contractor administration offices.
- Site clearance and demolition.
- Constructing construction access roads.
- Critical utility relocations and protection works.
- Canal relocations.
- Railroad relocations.
- Permanent grade crossing closures.

Temporary construction facilities should be acquired and cleared early in the construction schedule to provide flexibility.

If possible, utility relocations should be done before the main work commences to allow for more efficient excavations, grading, and foundation construction. The staging areas will need to be connected to the utility network (water, electricity, telecommunications) as early as possible.

8.3 Typical Construction Sequencing and Durations

Typical construction sequencing will include:

- Permanent and temporary ROW acquisitions by the Authority.
- Contractor mobilization – staging areas, pre-casting facilities, and supporting offices.
- Critical area utility relocations (by contractor and/or third parties).
- Railroad relocations
- Roadway relocations.
- Canal relocations.

- Hydraulic crossings.
- Wildlife crossings.
- Berm construction.
- Demolition of buildings and roadway structures.
- Roadway overcrossing structures.
- Roadway modifications.
- HSR at-grade earthwork construction.
- HSR retained fill construction.
- HSR viaduct construction (standard and non-standard).
- Demobilization.

A preliminary version of the project contract schedule that will be provided in the environmental documentation can be found in Appendix E. This version is subject to change.

9 TRAFFIC CONTROL AND DETOURS

Impacts to traffic must be minimized during construction and efficient movement through and around construction zones must be maintained throughout the duration of the construction. Extensive coordination with Caltrans, UPRR, and cities will be required. Detours allow for the most expeditious approach to completing the construction; however, they can cause public relation concerns within local communities. Detours require that current studies are performed to determine traffic volumes and movements that will be affected. Also, signal timing for proposed detour routes will need to be evaluated and signal phasing at intersections along detour routes will need to be adjusted to accommodate the new traffic volumes. Detour durations must be held to a minimum to avoid prolonged disruption to the traveling public. These are analyzed in further detail in the Environmental Transportation Technical Report.

9.1 At-Grade Crossing Replacement

The Blended At-Grade Alternative 4 will require reconstruction of a number of existing grade crossings between Santa Clara and Gilroy to accommodate shifted and new tracks.

Trackwork will be predominantly performed at night and on weekends, requiring short term roadway closures and establishment of roadway detours while roadway approach grading and paving is performed and new crossing panels are set. Crossing protection will be maintained through all phases of construction. Minor track work changes may be accomplished with temporary crossings permitting vehicular crossings between work shifts.

9.2 Monterey Corridor Grade Separations

For the grade separations required in the Monterey corridor, an assumed general approach is as follows:

- Close the crossing street, reduce the number of travel lanes on Monterey Road, and shift traffic to construct a portion of the new roadway including structures.
- Shift reduced number of travel lanes on Monterey Road to a newly constructed portion and complete the construction of the new roadway.
- Restore Monterey Road traffic to the new permanent roadway alignment and connect the crossing street.
- Complete the construction of HSR and UPRR alignments including structures to finish the grade separation.

For the grade separations required in the Morgan Hill and Gilroy corridors an assumed general approach is as follows:

- Install temporary roadway detours as necessary.
- Construct the HSR and UPRR embankment and structures (including UPRR shoofly tracks).
- Construct portions of new grade separated roadways. Temporarily reduce and shift travel lanes. Roadway closures will be evaluated in aggregate so appropriate detours are available.

9.3 Caltrain Station Access

There are six existing Caltrain stations that will need to remain in service during construction.

Caltrain Capitol Station

The existing Caltrain Capitol Station is in UPRR ROW under the dedicated HSR alignment viaduct as the alignment transitions from the west to the east side of the transportation corridor. To ensure public safety, the construction of the viaduct over the existing station would require either falsework over the station should the construction be done with CIP methods or the relocation of the station to the south should the construction be done with precast segments.

For the relocation option, we have developed an alternate location approximately 500 feet south of the existing station. This relocated station would be accessed using the existing Caltrain parking lot at Fehren Drive using the existing sidewalk on the east side of Monterey Road. A new mid-block, signalized pedestrian crossing would be constructed to access the station on the west side of Monterey Road. This relocated station could be either temporary or permanent since it is located outside of the construction area required for the HSR viaduct.

Caltrain Tamien, Blossom Hill, Morgan Hill, San Martin, and Gilroy Stations

The Tamien Station would remain in service and not require relocation. The Blossom Hill, Morgan Hill, San Martin, and Gilroy stations would be temporarily relocated so existing parking and access can be maintained. These relocations will be in conjunction with the UPRR shooflies associated with the at-grade alternative. The station relocations will need to be coordinated with the VTA as they operate and maintain them.

Additionally, roadway construction will impact local transit (non-rail) facilities, such as bus services, that will need to remain operational throughout construction. Temporary facilities will be provided (e.g. temporarily relocated bus routes and stops) with consideration for key transit locations and will be factored into the overall temporary traffic handling measures.

Traffic control features, such as construction signs and pavement makings, must be installed and maintained per current California Manual on Uniform Traffic Control Devices (CAMUTCD) Standards. Clearly identified construction zones and associated hazards must be in place prior to commencement of any construction activities to warn the traveling public and avoid potential liability claims. All traffic control measures must be reviewed twice daily, once at night and once during the daytime. Reports documenting all devices in use and the current status of the devices must be completed and submitted to the Design-Build team so deficient items can be immediately corrected.

To avoid logistical inconveniences for both construction crews and for the public, movements of materials and equipment will be made using the HSR ROW wherever practical.

Local and interstate highways will be affected by the movement of materials and equipment, and the contractor will be required to develop a Construction Transportation Plan to minimize this impacts. This plan will address in detail the activities to be carried out in each construction phase while maintaining traffic flow during peak travel periods. Such activities include, but are not limited to, the route and schedule for material deliveries, material staging and storage areas, construction employee arrival and departure schedules, employee parking locations, and temporary road closures, if needed. The plan will provide traffic controls pursuant to the CAMUTCD sections on temporary traffic controls (Caltrans 2014) and will include a traffic control plan.

Major construction traffic components are as follows:

- Import of construction materials, such as:
    - Fuel, oil
    - Water
    - Concrete
    - Steel

  - Cement
  - Aggregates
  - Fill material
- Mobilization/demobilization of equipment.
- Daily movements of craft labor.
- Export of earth or other unsuitable materials.

Planned traffic detours and modifications to existing traffic flows will be required for the construction of roadway overpasses and for periodic hauling operations.

For safety, security, and logistics reasons, this ROW area will be fenced, and access will be controlled. Access to the site will be via specific gates along the ROW that will be strategically located with easy access to roads and freeways.

10 CONSTRUCTION POLLUTION CONTROL

Dust, chemicals, noise, and vibration generated from the construction will pose significant concerns to the local communities. Control measures will be established to regulate these according to the mitigation and permit requirements outlined in the Environmental Impact Report/Environmental Impact Statement (EIR/S).

10.1 Air Quality

Air quality mitigation measures and permit requirements will be detailed in the EIR/S and will include:

- Wet down stockpiles and areas of incomplete construction for road beds and tracks.
- Dust palliative application.
- Provide soil tracking devices to remove dirt build-up on construction equipment tires at access points to construction. Soil devices would consist of broken rock and/or rubble placed on filter fabric to vibrate off loose mud and dirt.
- Provide street cleaning equipment.
- Provide temporary sediment barriers.

10.2 Noise and Vibration

The noise and vibration limits chosen for construction and operation of the HSR System satisfy the federal guidelines of the FRA and Federal Transit Administration (FTA) for trains and HSR facility operations and Federal Highway Administration (FHWA) as defined for California application by Caltrans for traffic noise.

During construction, some equipment, most notably pile driving equipment, may cause ground-borne vibrations. Pile-driving is only one of the several proposed construction methods, and it is only expected to occur where there is the need for a bridge, aerial structure, or road crossing. Construction equipment can produce vibration levels at 25 feet that range from 58 vibration decibels (VdB) for a small bulldozer to 112 VdB for a pile driver. With pile driving, there is potential for severe vibration impacts during construction that would have substantial intensity under the National Environmental Policy Act (NEPA) and would be significant under the California Environmental Quality Act (CEQA). Without pile driving, the impact would have moderate intensity under NEPA and would be less than significant under CEQA.

Mitigation measures and permit requirements for noise and vibration levels will be detailed in the EIR/S and will include:

- Restrict certain activities such as pile driving and hauling of borrow material to daytime operations only.
- Provide sound walls around generators and other stationary equipment.
- Monitor noise levels to ensure proper measures are taking place.
- Perform vibration and settlement monitoring.
- Cease operations with excessive vibration and evaluate alternative construction methods.

10.2.1 Water Quality

Water quality mitigation measures and permit requirements will be detailed in the EIR/S and will include:

- Prepare and adhere to approved Stormwater Pollution Prevention Plan (SWPPP).
- Comply with water quality permits (401/WDRs, 402, 404, dewatering)

11 CONSTRUCTION PERMITS

All construction permits must be obtained before starting construction. The Contractor must identify what permits will be necessary for the construction, ROW, easements, environmental protection, etc. for contract execution.

Below is a preliminary list of anticipated permits that may need to be acquired:

Table 11-1 Construction Permits

Jurisdiction	Potential Permit Required
California Department of Water Resources	Encroachment Permit
California Public Utilities Commission	Authority to Construct
Caltrain/Peninsula Corridor Joint Powers Board (PCJPB)	Right-of-Entry Survey Permit
Central Valley Flood Protection Board	Encroachment Permit
City of Gilroy	Building Permit, Encroachment Permit, Maintenance Agreement, Memorandum of Understanding (MOU)
City of Morgan Hill	Building Permit, Encroachment Permit, Maintenance Agreement, MOU
City of San Jose	Building Permit, Encroachment Permit, Flood Hazard Zone, Geological Hazard Clearance, Grading & Erosion Control, Maintenance Agreement, MOU, Utility Permit
County of Merced	Building Permit, Construction Detours, Encroachment Permit, Environmental Health Permit, Maintenance Agreement, MOU
County of San Benito	Maintenance Agreement, MOU, Encroachment Permit
County of Santa Clara	Building Permit, Encroachment Permit, Maintenance Agreement, MOU
Irrigation and Water Districts: See Hydrology and Hydraulics Report – PEPD	Encroachment Permit, Maintenance Agreement, MOU
Pajaro River Watershed Flood Prevention Authority	MOU
RWQCB, Central Coast Region 3	NPDES permit
RWQCB, Central Valley Region 5	NPDES permit
RWQCB, San Francisco Bay Region 2	NPDES permit in association with SWPPP
Santa Clara Valley Transportation Authority	Construction Access Permit, Restricted Access Permit
South County Airport	Encroachment Permit
Union Pacific Railroad	Right-of-Entry Survey Permit
United States Bureau of Reclamation	Encroachment Permit, Construction Access Permit, Maintenance Agreement

12 THIRD PARTY COORDINATION AND AGREEMENTS

12.1 Caltrans

The project crosses Caltrans property and facilities at numerous locations, and the San Jose to Merced section crosses Caltrans Districts, 4, 5 and 10. Throughout the HSR facilities construction, regardless of the alignment chosen from San Jose to Merced, the rail construction will require a working relationship with Caltrans and a binding agreement.

Prior to construction, an interagency agreement(s) between Caltrans and the Authority would clearly identify the agreements made for both the construction and ongoing operations and maintenance of both rail and highway facilities.

In this interagency agreement(s), the joint use of ROW with the rail either under or over Caltrans highway facilities needs to be accurately defined. Once defined, it must be recorded with the State of California State Lands Commission pursuant to the provisions of Section 101.5 of the Streets and Highway Code.

The impact of the rail construction on Caltrans facilities and highway traffic must be evaluated which should include, but is not limited to, the resulting change in the seismic safety of the highway structures. The change may occur from modified earthwork around bridge columns or abutments. If the highway structure is affected by the rail construction, the correctional mitigations should be included in the rail construction bid documents.

For the HSR project, it is possible several Caltrans divisions would be involved in developing an interagency agreement and conflicting recommendations are possible. Caltrans headquarters in Sacramento oversees the legal aspects of any agreement and typically gives final approval. Development of a typical agreement with Caltrans takes several months, so this agreement could take years to finalize due to the complexity of the agreement and the decision-making structure.

During development of the interagency agreement(s), there may issues that will arise. Since the design is not yet fully developed, the following issues are most likely not the only ones that may be experienced, but they provide a basic understanding of issues that have arisen in the past:

- Caltrans has required that structures built over state highways be built to Caltrans specifications.
- Design of a structure spanning a state highway could require multiple reviews by the Caltrans Bridge Department.
- Erection of the structure over the state highway will be dictated by Caltrans. Seven to ten locations will require rail line construction below a Caltrans bridge structure.
- Design of Caltrans bridges has been performed using planned site conditions.
- Planned rail construction can affect state highway ancillary facilities.
- Active construction under a Caltrans structure will pose several concerns for Caltrans and the agency will demand an oversight role.
- Address the future maintenance responsibilities for the project's constructed facilities and maintenance of the joint ROW in a section of the agreement.

12.2 Utilities

Constructability will be affected by the presence, characteristics, and handling of utilities within the project. Handling includes planning and executing both temporary and permanent changes to utility configuration. Each utility crossing that will be affected should be the subject of a definitive plan for construction. Utilities, being predominantly placed underground, are often the subject of claims for unforeseen conditions. Contractors also lodge claims when utility companies fail to act promptly and cause delay to the contractor's progress.

Utility companies possess certain rights to have and maintain facilities in easements within the HSR construction area, including in Caltrain, UPRR, Caltrans, and other local agency ROW and in the overall project vicinity. Utilities services must be kept in continuous operation except for short and well-planned outages related to cutovers and emergency repairs. For purposes of this discussion, a utility in the ROW is any non-railroad pipeline, conduit, channel, or other conveyance, including electrical or telecommunications.

In some cases, utility companies may own rights via easements, licenses, and permits to use property even where they do not have existing physical facilities. In nearly every case where utilities lines exist in the ROW they are subject to being moved and altered to accommodate the new construction of the HSR project. ROW expansion will encompass utilities that are not currently in the ROW.

The mutual duties established between the Authority, as project Owner, with each utility should be recorded in formal agreements that provide guidelines for what work is to be done, by whom, when, and how.

City and county jurisdictions operate utility enterprises as financial entities distinct from their general funds. Some utilities, notably telecommunications, may run in joint facilities such as duct banks and trenches. Relocation of these facilities requires multi-party negotiation and coordination that be time-consuming as various parties review proposals by others. Utilities sharing facilities may also have different design standards that can conflict with each other and require resolution.

Relocation of utilities that make use of the ROW for conveyance (longitudinal utilities) may require extensive design, including temporary relocations and tie-ins. These utilities may include telecommunications, electrical power, fuel and gas pipelines, and others.

The construction drawings should have detailed and accurate depictions of the utilities in the project vicinity. It is important to pothole critical utilities to assure the utilities are where they are believed to be.

12.3 Railroads

12.3.1 Caltrain

Constructability will be affected by the timeliness and provisions of agreements made with the PCJPB, which operates commuter rail service along the San Francisco Peninsula, through the South Bay to San Jose and Gilroy and maintains various systems and safety operations. PCJPB owns the ROW north of CP Lick.

Under the blended system concept, the HSR will operate using the same main tracks as Caltrain trains north of Diridon Station (or north of Gilroy under Alternative 4), so the HSR project will require thorough and detailed coordination of design, systems integration, construction planning, construction coordination, operational testing, and operations when HSR is in service.

Construction of the PCJPB Caltrain Modernization (CalMod) Project is expected to precede the HSR project. CalMod will install electrification and controls systems that will be compatible with and jointly used with HSR. When HSR is put into operation, Caltrain will exercise central control over the system including HSR trains.

New turnouts, switches, crossovers, and other installations on the existing main track will require several hours of train outages. Without agreed-on regular days and hours of operational outages, bidders will be unable to provide realistic bids and would most likely increase their bids to account for scheduling uncertainty.

Without detailed and mutually agreeable policies and procedures for joint usage of track areas during construction, HSR contractors will face unexpected and unscheduled interruptions in work causing delays and extra cost. Before construction, it is important to establish thorough and complete plans for site safety coordination in the form of a Project Safety Plan that is reviewed and interactively worked out with Caltrain. During construction, the team should practice joint

planning for specific work through Site Specific Work Plans, and investigate and troubleshoot any and all failures of safety planning, communication, and execution.

It will be important to establish a joint operations safety board including representatives of Caltrain, UPRR, Authority construction managers, and contractors that meets regularly and confines its discussion to operations and safety. The board will disseminate lessons-learned to project participants and the Authority for general distribution.

12.3.2 Union Pacific Railroad

Constructability will be affected by the timeliness and provisions of agreements made with UPRR. North of CP Lick, UPRR has retained certain rights for use of the Caltrain ROW that include revenue-producing ownership of utility easements and operation of freight rail trains. HSR construction will require that UPRR's utility easements be altered or bought to allow both temporary and permanent relocation. Our investigation of rail conditions and spurs indicates that a low volume of freight traffic runs along the Caltrain ROW; however, the Authority should expect UPRR to defend any ROW rights they possess vigorously. South of CP Lick, UPRR owns the ROW which Caltrain operates on. In areas both north and south of CP Lick, the construction of HSR will result in numerous impacts to the Caltrain and UPRR ROW. Negotiations with UPRR can be protracted and difficult.

HSR construction will require UPRR agreement and cooperation in five areas:

1. Freight Operations Schedule – Without agreed upon days and hours of operation by UPRR in this corridor, the contractor will be unable to provide a realistic bid and would most probably increase his bid to account for uncertainty.
2. Freight Operations Accessibility – Maintaining continuous access to spurs, sidings, and junctions during construction will be important to UPRR.
3. Material Transportation – An umbrella agreement would stabilize freight pricing in advance of bidding, giving contractors reliable costs and ground rules. Negotiation of prices and terms by the Authority could also be advantageous to the project by offering UPRR motivation to cooperate on other issues.
4. Using Off-Route Right-of-Way – It may be advantageous for the Authority to use UPRR ROW outside the HSR/Caltrain route as paths for non-rail methods of material movement. These could include spur tracks at Quint Street in San Francisco, the junction leading to the old Dumbarton railroad bridge, and the Milpitas and Oakland Subdivisions.
5. Utilities Relocation – Some UPRR-owned third-party easements will have to be relocated or purchased by HSR or Caltrain to accommodate construction.

It is recommended that the Authority complete a full and accurate study to identify all utilities running in the Caltrain ROW, conduct multi-party negotiation, and finalize multilateral binding agreements that will provide the basis for utilities relocations into new easements and for interim relocations appropriate for staging during construction process.

12.4 Local Jurisdictions

12.4.1 Discussion

The JM Section of the HSR route passes through three cities, three counties, and several unincorporated areas. Contractors will need to access the HSR site through these jurisdictions. Issues, including utility relations, street conforms, property takes, and many others will need to be agreed upon preferably before awarding contracts. Prior to a construction bid, detailed agreements with jurisdictions would fully inform and formalize the project's proposed construction details, environmental mitigations, and operating parameters.

Municipal codes and policies will vary in each jurisdiction affecting rules involving working hours, haul routes, noise, and other factors in construction. Failure to obtain binding and detailed legal

agreements with the local jurisdictions will result in possible additional project costs and delays. Uncooperative cities and counties have the power to close haul routes, restrict traffic movements, restrict movement of oversize loads, and place weight limits on streets necessary for import and export of material.

Cities and counties may have locally-owned utilities that will be affected by the rail construction. These often include sewer, storm drain, and traffic signal conduits. The protection or rerouting of these utilities where they are affected needs to be detailed in the agreement, including who will be responsible for the work and how payment will be made if the city or county does the required work. Since both sewer and storm drainage systems rely on gravity for flow, the utility relocation or protection cost could be extensive, requiring rerouting or, in some cases, pump stations.

The following are some of the most important local construction work concerns that should be included in the local agency agreements.

- Building Permits
- Haul Routes and Traffic
- Street Closures
- Work Hours
- Use of City Standards
- Dust, Air Pollution, and Odor Control
- Sound Control
- Project Appearance

12.5 Coordinating Betterments and Adjoining Third Party Work

12.5.1 Discussion

Constructability will be affected by work the Authority agrees to undertake on behalf of other agencies and stakeholders. For instance, a city may wish to increase the size of a sewer pipeline crossing the right-of-way that must be rerouted to clear a bridge footing. Since the increase in pipe size is mandated by its sewer master plan, the cost difference between the smaller and the larger pipe would be paid by the city because the Authority is responsible for a replacement not a better facility.

Likewise, any major project is often accompanied by work done by other agencies and adjoining landowners at that stakeholder's expense. Although this can be referred to as "adjoining work", in some cases this work takes place within the HSR project limits. Both kinds of work are prone to disagreements on cost and can affect the schedule.

The construction agent (i.e., the stakeholder's design and construction representative) for this work may be the Authority through a negotiated agreement, a stakeholder, or another party. Many betterments are best incorporated into contracts for the major project for unified coordination of the schedule and budget.

A good interagency C&M agreement must be thorough and clear about the financial responsibility for all betterments, and the costs should be agreed on prior to beginning work. In a design-build contract without unit price bids, this will be difficult, but better than after the work is performed when it could not be modified. Agreements should provide for additional payment to HSR for price escalation, unforeseen conditions, and other possible occurrences that increase costs.

13 POTENTIAL EXCAVATION HAZARDS

13.1 Surface Soils

The project area is underlain by sedimentary soils from the surface to a depth below the likely depth of project excavations. Soils include combinations of sands, gravel, cobbles, silts, and clays. Granular soils can “run”, pouring from excavation surfaces and creating instability. Fine sands can also be saturated with water and be difficult to compact without using methods to drain the water or chemically stabilize them with cement or lime. These conditions should be expected and provisions made in the contract documents for remedies.

13.2 Deep Excavations

With deep excavation, the contractor is likely to encounter site conditions that differ from those depicted in the contract documents. Groundwater may also differ from what is shown in soil borings. Differing site conditions often result in disputes and then change orders or claims. Deep cuts will require that soft native soils be shored and reinforced to avoid settlement of soil structures. Groundwater intrusion and settlement can be minimized by specifying the means of shoring at the trench boundaries to create a water seal that keeps drawdown at a minimum in areas adjoining the trenches. These might include overlapping drilled piers, slurry walls, and watertight sheetpile walls.

In the project area, the water table can be high enough to seep into excavations, requiring collection and disposal of groundwater. Flowing groundwater can cause settlement in the ground above drawn-down soil volumes. Also, the groundwater may include contaminants and its disposal may require treatment and/or costly disposal. Likely contaminants and volumes to be disposed should be estimated and methods of disposal agreed upon before beginning construction.

Reinforcing methods such as anchors or soil nailing may require ROW actions be taken when they will be placed under adjoining properties. A survey of engineering solutions to prevent ground movement should be undertaken early in the 30% design phase when the final railroad alignment is determined, , including a constructability review and a detailed estimation of probable costs to serve as a decision-making guide for the most appropriate methods.

Some of the areas adjacent to the project are densely populated with residential and commercial structures that could sustain damage if the ground under them subsides or moves laterally. A pre-construction condition survey should be performed to document the condition of adjacent properties.

14 RIGHT-OF-WAY ACQUISITION

The Authority plans to acquire all needed ROW including TCEs prior to the start of construction. Property acquisition for the HSR section from San Jose to Central Valley Wye will involve over 1,000 parcels for each of the alternatives. Under rules and statutes, both State and federal, acquisition of property is time-consuming and not predictable regarding method or timeliness. Properties that will have to be acquired include private properties, state and local ROW, and utility property.

HNTB gathered existing ROW information from the counties within this section from digital assessor's parcel map data, including the assessor's parcel number and the parcel size. ROW and parcel boundaries, parcel information, and HSR footprint were displayed in GIS format, and the areas of acquisition and remnant and excess parcels were calculated.

Most parcels will require a partial acquisition of their total area resulting in a remnant that is not needed for the project. In some cases, a full acquisition of the parcel was determined to be necessary. This will be the case if the Regional Consultant (RC) observed that either (a) the remainder is not a viable economic unit that retains its highest and best use or (b) the impact to remaining land and improvements is too great to continue to function. In other cases, damages to an area of a parcel were determined to be necessary. An area was classified to be damaged if the RC observed that there will be no legal access, in addition to the criteria used for full acquisitions.

Property acquisition for HSR has occurred already in Merced, Fresno, Kings, and Kern counties. Lessons learned from this process are expected to help establish and improve HSR guidelines and practices for property acquisition.

Failure to acquire ROW for the project will delay both the start and the progress of construction. If construction is commenced without cleared ROW, it is most likely to result in costly ROW delay claims and an overall project delay. Because of the significant amounts of ROW that must be acquired, there is a risk that a lack of qualified ROW engineers, appraisers, title professionals, and acquisition staff will result in project delay.

In the past, taking too many properties has caused a backlash of public opinion and resulted in more restrictive and time-consuming ROW practices which would further slowdown the acquisition process.

Property acquisition from UPRR and other governments can be lengthy. If acquisition work on those properties is not started early, these difficult properties will delay the project.

ROW acquisition will likely be on the critical path for those segments that have numerous properties to acquire before starting construction. When prioritizing construction projects, it may be wise to select the segments with more challenging acquisitions.

As soon as an option is decided on and approved, negotiations with cities and counties for their properties needed for the rail construction and operation should begin. See Section 12.4 Local Jurisdictions. Also, negotiations should begin with each identified utility that will be affected by the project. These negotiations would include the party performing utility relocation or protection, when the relocation would be accomplished, and who would be paying for the required work. See Section 12.2 Utilities.

15 CONSTRUCTION POLLUTION CONTROL

Hazardous Materials – Portions of the project area has been in use for decades for transportation, industrial, and commercial purposes. The soil in numerous locations has accumulated pollutants, some of which may have been deposited or migrated to the project area in groundwater.

Contaminated materials that must be removed or may be reused by the project will need to be retested for disposal or reuse to assure that disposal or reuse is proper and legal. The soil adjacent to operating rails is often contaminated with either lead or petroleum products. Some of the material from the abated structures and contaminated soils may require removal to a Class 1 landfill. For California, this type of material is usually transported to Kettleman City or Coalinga — about 200 miles southeast of the project. Cost of the disposal is high at the Class 1 landfills and the Authority could have future costs from the Class 1 landfill disposal since generators are held responsible for the materials in perpetuity.

In the San Francisco Bay Area, there are specialty contractors that undertake abatement of toxic materials and obtain regulatory permits to clear the property. These specialty contractors can either work as prime or subcontractors for the prime rail contractor.

Noise and Vibration – Construction equipment and processes create noise and vibration that can affect nearby stakeholders in their residences, commercial establishments, work places, and outdoors. The EIS will provide an analysis of these effects and recommend mitigations in areas where noise/vibration effects are excessive. Construction contracts should require observation of mitigation measures and set performance standards. A pre-construction study of ambient conditions should be conducted to measures noise and document conditions in structures close enough to construction activities to be potentially damaged by vibrations.

Dust Control – Much of the project will take place near residential and commercial land uses. Contract documents should include stringent provisions requiring builders reduce dust emissions to a minimum.

16 CONCLUSIONS

This phase of the San Jose to Merced Project Section project development does not lend itself to concrete technical conclusions and recommendations about constructability, project delivery, and contract packaging. Rather, this report focused on constructability issues that are appropriate to the current plan development stage.

We concluded that each of the four alternatives, as currently presented, can be built but they present varying degrees of complexity, cost, duration, and impact on the environment and the public. Physical and other constraints on each alternative will vary the expense, duration, and impact of each alternative.

Costly concerns that should be addressed in detail before the project is built include:

- Property acquisition will be long and complex. The Authority should carry out property acquisitions itself and not delegate this to the design-build contractors.
- Construction work should not begin on the route segment before all property acquisitions are completed.
- Responsibility, processes, and payment mechanisms for dealing with unforeseen environmental contamination should be established in construction contract documents.
- C&M agreements with stakeholders including local jurisdictions, Caltrans, and utilities should be comprehensive, detailed, and executed before beginning construction.
- Reflect stakeholder agreements in the construction contract documents and bind contractors to perform in accordance with them.
- Accommodation of Caltrain and UPRR train operations will constrain construction operations and increase the construction cost and duration.
- At-grade and viaduct cross-sections are the most buildable cross-sections.
- Trench and embankment cross-sections present the most difficult staging challenges mostly due to constrained ROW width, earthmoving operations, and difficulties stemming from keeping Caltrain, UPRR, and Caltrans operational without modification.
- Identified laydown and staging areas are not large enough to efficiently support the work. Property acquisitions by the Authority will be needed to provide adequate areas.

APPENDIX C: MONTEREY HIGHWAY VIADUCT, PRECAST BOX GIRDER YARD DIMENSIONS

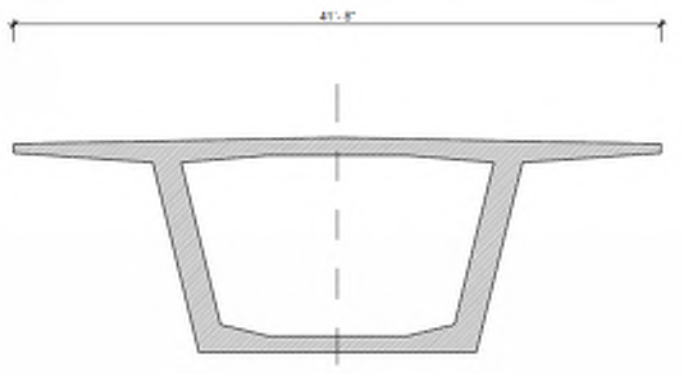
Appendix C
Monterey Highway Viaduct
Precast Box Girder Yard Dimensions

prointec

1. Introduction

To establish the necessary dimensions of a box girder precast manufacturing yard, the required production rate, beam manufacturing process, yard layout and the installation/erection equipment must be considered.

The precast yard will need to produce typical single cell box girder sections up to 130 ft. in length.



As a baseline scenario, the beams production and installation/erection must meet the constuction schedule of 2.5 years (30 months). The number of precast yards and installation/erection equipments must fit within this construction schedule considering their individual production and installation rates.

1. Introduction

Supply needs:

The total length of the Monterey Highway Viaduct is 142,798 ft., and consists of four different structure types:

• Typical single column spans:	122,200 ft	(85.57%)
• Multi-column straddle bents:	9,800 ft	(6.86%)
• Long Span balanced cantilever spans:	5,500 ft	(3.85%)
• CIP continuous spans:	5,300 ft	(3.71%)

Typical single column spans and straddle bent spans will be constructed sing precast beams, since they cover more than 92% of the total viaduct length.

The precast yard must be capable of producing 132,000 ft box girder beams.

Manufacture Planning:

In order to meet the overall construction schedule the beam installation/erection rate is estimated at 1,023 feet per week. The required number of beam launching gantries and associated support equipment is estimated as follows:

• Total precast beam length:	132,000 ft
• Construction Schedule:	30 months (129 weeks)
• Precast beam installation rate/week:	132,000 ft/129 weeks = 1,023 ft per week
• Number of launching gantries:	1,023 ft/ 650 ft per week per team = 1.57 -> 2 gantries

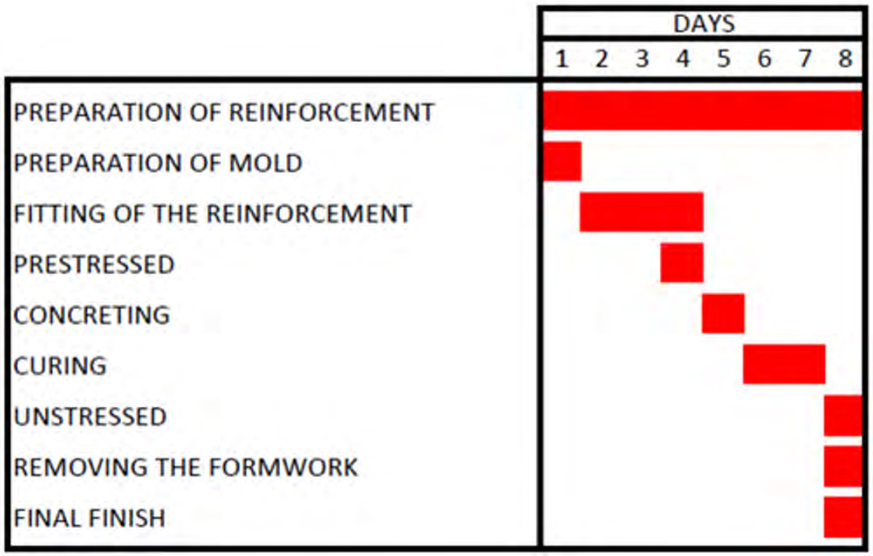
1. Introduction

Production needs:

The precast yard will need to produce 1,300 ft. of precast beams a week in order to supply each of the two installation/erection teams with 650 ft. of precast beams per week.

Yard Production Rate:

A precast yard with 3 –260 ft. casting benches can produce 780 ft. of preast beams per week. The work would alternate between the benches, including work tasks such as armouring, concreting or removing the formwork.



1. Introduction

Precast yards

As stated previously, a single precast yard production rate is estimated to be 780 ft. of precast beam per week.

In order to keep up with the two installation/erection teams combined rate of 1300 ft/week, the number of precast yards needed is estimated as follows:

- Total precast beam length: 132,000 ft
- Installation/Erection per week (ft): 1,300 ft/week (650 ft / week * 2 gantries)
- Number of precast yard needed: 1,300 ft/week installation / 780 ft/week production = 1.66 -> 2 precast yards needed

2. Dimensions of the precast yard

To overall dimensions and layout of a precast yard should take into account the following elements and its space requirements:

1. Beam Manufacture
2. Concrete Manufacture
3. Steel Storage
4. Beam Storage (25 Units
5. Equipment Parking
6. Parking & Building
7. Road

2. Dimensions of the precast yard - Beam Manufacture

1. Beam Manufacture

Beam manufacture is the most important element of the precast yard, as it will be where the precast beams are manufactured. In order to match the beam manufacturing pace to the erection pace, it is necessary to have 3 - 260 foot long benches that are capable of holding two beams each. For the purposes of sizing the precast yard, the beams are assumed to be single cell box girders, up to 130 feet in length, and 43 foot deck width.

The facility cranes must be able to lift 130 ft. long beams, each weighing an estimated 1,000 tons.

The estimated dimensions needed for beam manufacture is 460 ft. x 333 ft., representing an area of approximately 153,225 ft.^{2}.

2. Dimensions of the precast yard- Concrete Manufacture

2. Concrete Manufacture

The precast yard requires an exclusive concrete mixing plant to supply the concrete necessary for the manufacturing of the beams.

The daily production capacity must equal the volume of concrete required for two 130 ft. beams. This daily concrete production is estimated at 8,400 ft.³/day. The concrete manufacturing plant must have an output of 1,150 ft³ / hour. The space for the concrete manufacturing area includes room for:

- Cement silos
- Stockpiles of aggregates
- Additive silos

The estimated dimensions needed for concrete manufacturing is 485 ft. x 150 ft., representing an area of approximately 71,700 ft.².

2. Dimensions of the precast yard- Steel Storage

3. Steel Storage

A reinforcing and prestressing steel stockpile area is needed for steel supplies, which will also include a scrap metal processing area.

The estimated dimensions needed for reinforcing and steel storage is 280 ft. x 130 ft., representing an area of approximately 36,300 ft.^{2}.

2. Dimensions of the precast yard- Beam Storage

4. Beam Storage (25 Units)

The beam storage area will be used to cure and store the beams prior to erection.

Given the large dimensions of the beams, the storage area must take into account space for the movement of mobile gantries for loading and access to the transport roads.

The estimated dimensions needed for this beam storage is 525 ft. x 435 ft., representing an area of approximately 290,625 ft.^{2}.

2. Dimensions of the precast yard- Equipment Parking

5. Equipment Parking

The precast yard will have other machinery and heavy equipment needed for the production the beams and transport, loading and unloading of different materials and handling of the beams. This equipment includes: mobile gantries, overhead cranes, loaders, truck cranes, forklifts, etc.

The estimated dimensions needed for heavy equipment parking is 280 ft. x 130 ft., representing an area of approximately 36,300 ft.^{2}.

2. Dimensions of the precast yard- Building & Parking

6. Building & Parking

The precast yard will have buildings for technical and construction staff, cafeteria, changing rooms and other necessary facilities, plus a space reserved for staff parking.

The estimated dimensions needed for the buildings and parking is 300 ft. x 130 ft., representing an area of approximately 45,000 ft.^{2}.

2. Dimensions of the precast yard- Road

7. Road

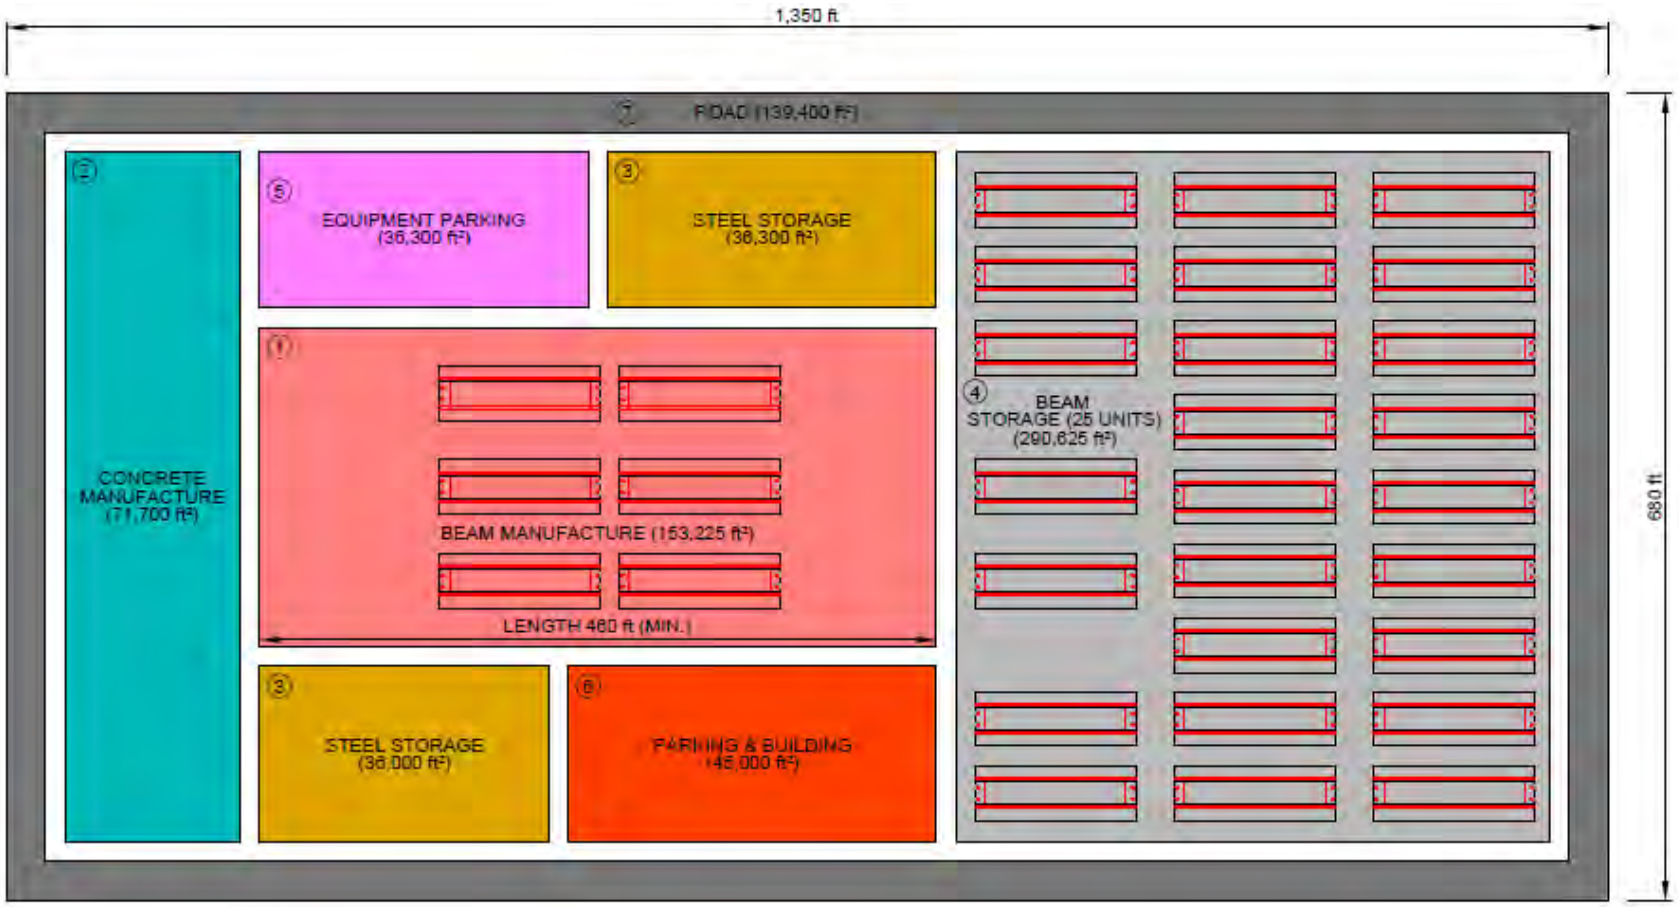
The precast yard will have a road around the perimeter of the yard, which provides access to all facilities. The road must provide access to the prefabricated beam stockpile area, and must consider the space needed for beam movement and other transporatation limitations.

The road occupies an area of approximately 139,400 ft.^{2}.

3. Precast yard layout

Total yard dimensions

The sum of all the above items requires a total area of 21.07 acres, with approximate dimensions of 1,350 ft. x 680 ft.



Precast Yard

SAN JOSE STATION APPROACH CONSTRUCTABILITY ANALYSIS

1. General approach and main criteria

1.1 Current situation description

At present the existing non-electrified double tracked railway line is operated by Caltrain for combined traffic (both passengers and goods). The main purpose of this railway line is to provide a service for commuters and short distance journeys. This line is envisioned to be electrified in a near future.

This railway line runs in a high density urban environment between San Francisco and San Jose Diridon, from where it continues on its way down to Gilroy.

Next to the existing railway alignment, at certain locations, there are other railway infrastructure systems, such as the Bay Area Rapid Transit (BART) and the Light Rail Transit (LRT).

The current railway line has 25 existing railway stations, the main ones being:

- San Francisco. Final stop at the end of the line.
- Millbrae. Railway station for mixed rail traffic together with the BART station, beside San Fransisco International Airport.
- Mountain View. Railway station for mixed rail traffic together with the LRT station.
- San Jose Diridon.

The route is generally at-grade, generating a large number of at-grade crossings with other existing infrastructure. Crossings with major communications routes are resolved by raising the alignment above the existing railway line.

Along the railway scheme there are several railway yards and tie-ins, amongst them for example is the one coming from Oakland and the railway facilities (workshops, garages ...) next to the San Jose station.

1.2 Future situation. Alternative options

The project aims to connect San Francisco and San Jose Diridon by a high-speed corridor, integrating the new high-speed railway (HSR) line with the existing Caltrain railway. For this purpose there will be four tracks in some segments (San Carlos Station, Bayshore Station, San Jose Statión).

Being a high density urban area, the allowance for the Right of Way (ROW) is low, which forces the tracks to be depressed or raised at some locations.

Most of the existing railway station configurations are to be adjusted under the new layout for the Caltrain tracks, because of variations in the functional organization.

Two alternatives have been studied for San Jose Diridon Station (Wide and Narrow), both are similar in San Jose Station and are aerial, the difference is the length of aerial segment.

A four-track, aerial HSR station in San Jose would be located above the existing San Jose Diridon Station. Two 30-foot-wide and 800-foot-long dedicated HSR platforms would be constructed above the existing Caltrain tracks and platforms. The new HSR station facilities, including a station house area for ticketing and support services and an indoor station room for passengers, would be located north of the existing historic Caltrain corridor. The design of the station areas would provide pick-up and drop-off facilities along Cahill St., as well as intermodal connectivity with BART, Santa Clara Valley Transportation Authority (VTA) light rail, proposed Bus Rapid Transit (BRT) lines, and buses. Circulation linkages between the station house and the station platforms may include hallways, an access bridge to cross over railroad tracks, stairs, escalators, elevators, and moving sidewalks. Parking would be provided at two parking lots along Cahill Street and Stockton Avenue, and a net 156 additional parking spaces would be provided.

1.3 Railway services operation and works progress compatibility

The purpose of this constructability analysis is to define a works organization to make the railway service operation feasible during construction. In order to fulfil this goal a number of conceptual sketches and phases have been defined.

This analysis provides solutions to make the work progress compatible with the rail service; however there is more than one way for implementing the final layout and this will be established in more detail in proceeding further steps.

This conceptual works arrangement has been established taking into account a number of criteria:

- Safety. All the works features and components (temporary and final ones) have been defined to guarantee the maximum safety standards. This applies to the

railway operations, the construction process and any road users (road traffic, pedestrians...) in the influence area of the line and the works.

- Construction feasibility. To maintain the existing railway corridor in operation, a number of specific construction methods and track layouts have to be taken into consideration. All of them have been devised from the point of view of the works progress feasibility.
- Process economy optimization. The need to maintain trains in operation during construction requires some specific actions. All the solutions have been devised in order to minimize additional cost or time increases.
- Railway operations performance level. To get a realistic balance between the construction cost and the railway´s service performance, some limits on this have to be introduced. Taking into account the temporary nature of the limitations on the railway service, some partial line functionality and capacity will be redefined.
- Temporary additional ROW need minimization.
- Other disturbances limited to a minimum (pedestrians, road traffic...)

To achieve the goal of maintaining the trains in operation in accordance with these criteria, the following main procedures have been applied:

- Temporary railway components construction. In order to make it feasible and efficient to build different pieces of the new system, some additional tracks or platforms will be introduced with a temporary function.

2. Construction activities sequence.

The infrastructure construction process is a complex one that can be organised in order to optimize different parameters (budget flow, time schedule, uncertainties). For this particular railway corridor the construction sequence has been defined in order to optimize the balance between cost, time schedule and railway's service performance level, **in this study an electrified line is considered**. In accordance with this, the following main criteria have been applied:

- Final elements / temporary layouts. For every single section that the corridor has been divided into, a specific track layout has been proposed that combines future infrastructure elements with those of a temporary nature.

These temporary components and track layouts have been designed specifically for the following different kinds of infrastructure construction:

- at grade
- elevated
- in a trench
- underground or tunnel

- "Railway capacity enlargement" as a main criterion. The construction process sequence has been developed on the basis that the future infrastructure railway capacity will be higher than the current one. To take advantage of this, the sequence has been defined giving priority to build components that contribute to increased operational capacity without disturbing the existing service.

  Temporary tracks are introduced into these segments and phases, where the continuity of the works requires the removal of the existing tracks.

  With this approach, a "construction-demolition-construction" process is introduced. The priority is given to the construction of final additional tracks. After the commissioning of these tracks the existing ones can be removed. Finally the remaining tracks for the final layout can be built where the old ones lie.

- Partial completion and commissioning. The railway operation performance can be optimized through the combination of all of these criteria. Particularly, the combination of splitting the corridor into segments and independent commissioning of ready segments, not only reduces the length where the railway performance is limited but also allows the introduction of a higher level standard of operation that contributes to a balancing out of restrictions existing in other segments.

  A specific treatment is devoted to the different main passenger terminals as they are very specific facilities.

- Railway operation during works. Condition limitation. Maintaining the railway's service performance standards when the corridor is experiencing major works, is a real challenge.

To keep the unavoidable additional costs or works time schedule increase at reasonable levels, the rail operational performance can be temporarily reduced to acceptable limits.

There are two main parameters of the railway that will be influenced by the construction process: the line's functionality and capacity.

- Influence on line's functionality.

  The line's functionality will be limited to some extent for the different phases and segments. The quantification of this limitation will be linked to the actual time scheduling of the different segments along the corridor.

  As a general rule, this limitation will have common attributes: the speed restrictions that will limit to some value the partial travel times and the availability of platforms at stations that could limit the number of destinations or intermediate stops.

- Influence on line's capacity.

  The line's capacity will also experience some reductions. These will arise from a number of sources and some of them will have to be especially taken into account.

  The main one is the presence of some temporary single track segments. It has to be considered that for longer sections above a certain length, the resulting capacity reduction could be unacceptable.

  Some single platforms stations could contribute to additionally reduce the network capacity.

  Two other sources of capacity reduction would be the speed restrictions along temporary alignments and local track short breaks for connections during non-peak periods.

3. Summary and main comments.

The scope for this constructability analysis is to define a feasible way of organizing the works programme to make it compatible with keeping the railways in-service and in an efficient manner.

The main design criteria takes into account safety, construction feasibility, economical optimization of processes, quality of railway's service and minimization of temporary ROW needs.

The procedures to meet the objective are based on the division of the scheme into independent sections and on temporary railway components construction.

In order to optimize the balance of the cost/time ratio and railway's service performance, the following criteria have been applied: final elements/temporary layouts combination; "railways capacity enlargement" processes; partial completion and commissioning; and acceptable constrains in railways operational conditions.

The works organization will have a limited influence on the railway's service performance. This will have regard specifically for the line's functionality and capacity.

The analysis includes some especially complex segments where specific arrangements and track layouts have to be implemented to make the works progress and railway operation feasible.

At detailed design stage, a more specific analysis for the selected option will contribute to reducing to a minimum the railway's operation restrictions through a more detailed work plan and track layout definition.

1. WORKING APPROACH

1.1 Purpose

The purpose of this report is to define the improvements to be made in corridor to increase its performance so that in the future it can be used by Caltrain, UPRR and high speed.

For this reason, a series of construction phases and construction procedures are proposed that minimize the traffic disorders during the works and making the circulation through the corridor compatible with the works of modernization of the line.

Currently, San Jose to Gilroy Corridor is operated by Caltrain and UPRR. Caltrain provides commuter services between both cities and UPRR freight services. In the future, this corridor will be used by high-speed, commuter and freight circulations. The line adaptation will involve the realization of a series of works. The planning of these works has been carried out reducing the impact to the current services, for this reason the constructions phases have been adapted.

In addition, they have taken into account the indications of Caltrain in terms of temporary windows to undertake the work.

1.2 Existing Operational Assumptions

The works along the corridor, are mainly consisting on track realignment along the route and track layout reconfiguration at some stations. Maintaining the service in operation under an electrified line is the main assumption considered to develop the inception and organization of the works to adapt the line to the future blended system including high speed trains.

The definition and organization of the construction described herein was developed to comply with the criteria included in the “Caltrain Operating Conditions and Constraints” (RFP Design-Build Electrification Services, 2014) developed for the Caltrain electrification project (CalMod). The guidelines for construction are based on taking advantage of the lower density services on weekends by running service on a single track in segments and conducting preliminary and follow-up activities during night periods without traffic. According with the CalMod criteria, this approach will be managed within a flexible frame: “When possible, Caltrain will maintain an operating profile that matches the 2014 operation. However, adjustments will be made as construction and ridership necessitates”.

The track realignment construction is being defined based on the same criteria: working in single track by segments on weekends and on both tracks night both closures. Due to the nature of the construction for of the trackway, the needs of track possession will be

substantially greater than the required just for building the OCS, but it will be maintained within the frame of the main criteria.

Regarding service operations, it will be necessary to take into account that some temporary speed restrictions will be introduced in limited segments; crossovers functionality could be temporarily limited during relocation works and at critical stages some stations and platforms could be closed to carry out special tasks.

In summary, the assumptions considered are:

- The line is in operation from Scott Boulevard to Gilroy and the OCS is in service between Scott Boulevard and CP Michael in the corridor prior to construction.
- The track realignment construction will be carried out according to track possession work windows:
    - Weekday days, each day (Monday-Friday): Mid-day during week between morning and afternoon rush hours. Single tracking 9am – 5pm.
    - Weekday Nights (Monday and Thursday only): Single tracking 8pm until 4am, Monday night and Thursday nights, with both tracks out of service after completion of revenue operations 1am until 4am.
    - Weekends (Friday night to Monday morning): Weekend, single-tracking, 56-hour continuous work window from 8pm Friday night until 4am Monday morning, with both tracks out of service after completion of revenue operations 1am until 4am Friday, Saturday and Sunday night.

  The above Work Window hours include the track time required for mobilization and set-up.
- Station platforms will be closed occasionally.
- Speed restrictions will be limited to the minimum required period.
- Crossovers functionality could be temporarily limited during relocation works.

1.3 Regulations Applied

The regulations applied for the checking of the geometric layout of the Scott to Gilroy realignment are as follows:

- “California High-Speed Train Project Design Criteria September 2014, Rev 2.
- SECTION 01040. WORK HOURS AND TRACK ACCESS of the CalMod Design-Build Electrification Services.

1.4 Analysis Assumptions

Currently the San Francisco to Gilroy Caltrain corridor is not electrified, but it is assumed to be for the purposes of this study. The segment between SF and SJ is assumed that the electrification is complete. The segment between SJ and CP Michael only the right track is electrified. The rest of section is considered without electrified.

The main track profile is identified on the proposed plans and existing corridor track charts for the northbound track (San Jose to San Francisco direction) only. It is assumed that the southbound track (San Francisco to San Jose direction) profiles matches the northbound track, for both the existing and proposed alignments.

It is important to note that there is no information for the thickness of the ballast layer nor the condition and characteristics of the railway platforms. Therefore in this study it will only be reflected if there will be increases or decreases in the future track level regarding the existing one.

1.5 Input data

The starting point for the analysis of this adaptation is the developed within the study and is grouped as it follows:

- Current Situation:
  - Layout file: TT-Existing-2016.alg
  - File dgn: X-FJ-TT-ALGN-EXST-CALTRAIN-2016.dgn
- Future situation:
  - Layout file: Alt4-CPCST-CPLK.alg
  - File dgn: X-JM-TT-ALGN-PROP-ALT4-CPCST-CPLK.dgn Scott to CP Lick
  - File dgn: X-JM-TT-ALGN-PROP-ALT4-CPLK-GLRY.dgn CP Lick to Gilroy

2. CURRENT SITUATION

The existing Caltrain corridor is a non-electrified, two track configuration, with shared commuter service (operated by Caltrain) and freight service (operated by UPRR). The main purpose of the existing corridor is to provide a service for commuters and short distance journeys. Construction of the CalMod project, prior to the construction of High Speed Rail (HSR), will provide electrification and control systems to the Caltrain service.

The Caltrain corridor runs in a high density, urban environment between San Francisco-4th & King Station and San Jose-Diridon Station; then continues south to Gilroy.

Next to the existing railway alignment, at certain locations, there are other railway infrastructure systems, such as the Bay Area Rapid Transit (BART) and the Light Rail Transit (LRT).

Caltrain current has 9 existing railway stations between Scott and Gilroy, the main ones being:

- San Jose
- Gilroy

The route is generally at-grade, with a large number of at-grade crossings with local roadways. Crossings with major communications routes have been resolved by raising the utility above the existing railway line.

Along the railway corridor there are several railway yards and tie-ins; such as the connection to the UPRR Coast Subdivision (with service from Oakland) and the railway facilities (workshops, garages, etc.) connection located next to the San Jose station.

3. FUTURE ACTIONS

Implementing high speed service along the Caltrain corridor will mean adapting the existing layout to the higher standards. Among the actions to be carried out are:

- Adaptation of the existing alignment to various degrees, both in horizontal and elevation; increasing the value of the existing radii and the track centers.
- Implementation of new platforms for the current stations.
- Remodeling of existing stations accordingly for high-speed services.
- Actions on the main track to include new railway facilities.
- Removal, replacement and installation of turnouts.
- Adaptation of electrification to the new layout.

The Caltrain stations along the route will undergo an adaptation where existing platforms will be remodeled to a length of 700 ft. and some of the stations will be relocated. The San Jose and Gilroy stations will be equipped with exclusive high-speed platforms with lengths of 1,400 ft. and 800 ft. respectively.

Future railway operations will combine high speed and commuter and freight services along the same corridor, creating a blended system.

3.1 Actions in the horizontal layout

3.1.1 Classification

The actions on the railway grade consist of moving it to improve the existing route or increase the distance between track centers. These lateral displacements (track shifts) will be conditioned by the presence of poles for electrification.

The following classification is established:

- **Lateral displacements of the track between 0 and 1 ft.**

  In this case, it is assumed that the tolerances of the existing electrification system will allow the lateral displacements of the track without needing any new OCS posts. For displacements between 0 and 1 ft. a tamping machine is used.

Figure 1. Tamping machine used for lateral displacements of the track between 0 and 1 ft.

- **Lateral Displacements of the track between 1 and 10 ft.**

  In this case, the poles of the existing electrification are affected so it is necessary to remove them to move the track. When it may be required to maintain the service during construction, it will be necessary to install an auxiliary electrification system.

  In this distance, a lateral displacement of the existing track to its definitive position would be constructible, but it would not possible to construct new track parallel to the existing while keeping service in operation since the ties would overlap.

Figure 2. Lateral Displacements of the track between 1 and 10 ft

- **<u>Lateral Displacements of the track between 10 and 21.34 ft.</u>**

  In this case, the poles of the existing electrification will be affected so it is necessary to remove them to move the track.

  This distance allows the construction of the new track parallel to the existing one, while keeping the railway traffic in service, as long as the existing electrification pole is removed.

Figure 3. Lateral Displacements of the track between 10 and 21.34 ft

- **Lateral displacements of the track greater than 21.34 ft.**

  The works are carried out outside the area of influence of the existing railway track, so the railway traffic is not affected.

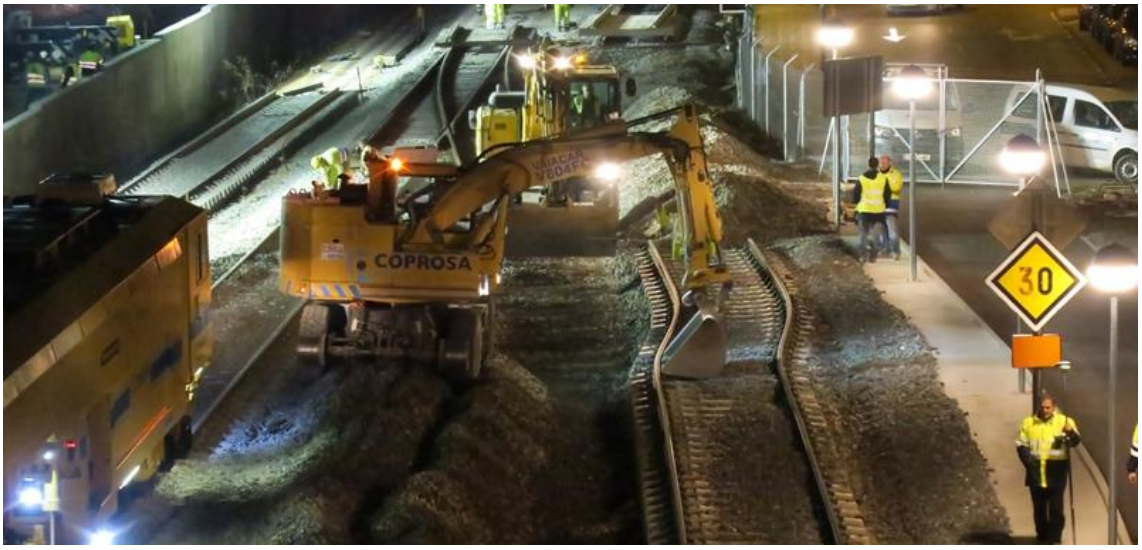

Figure 4. Lateral Displacements of the track greater than 21.34 ft

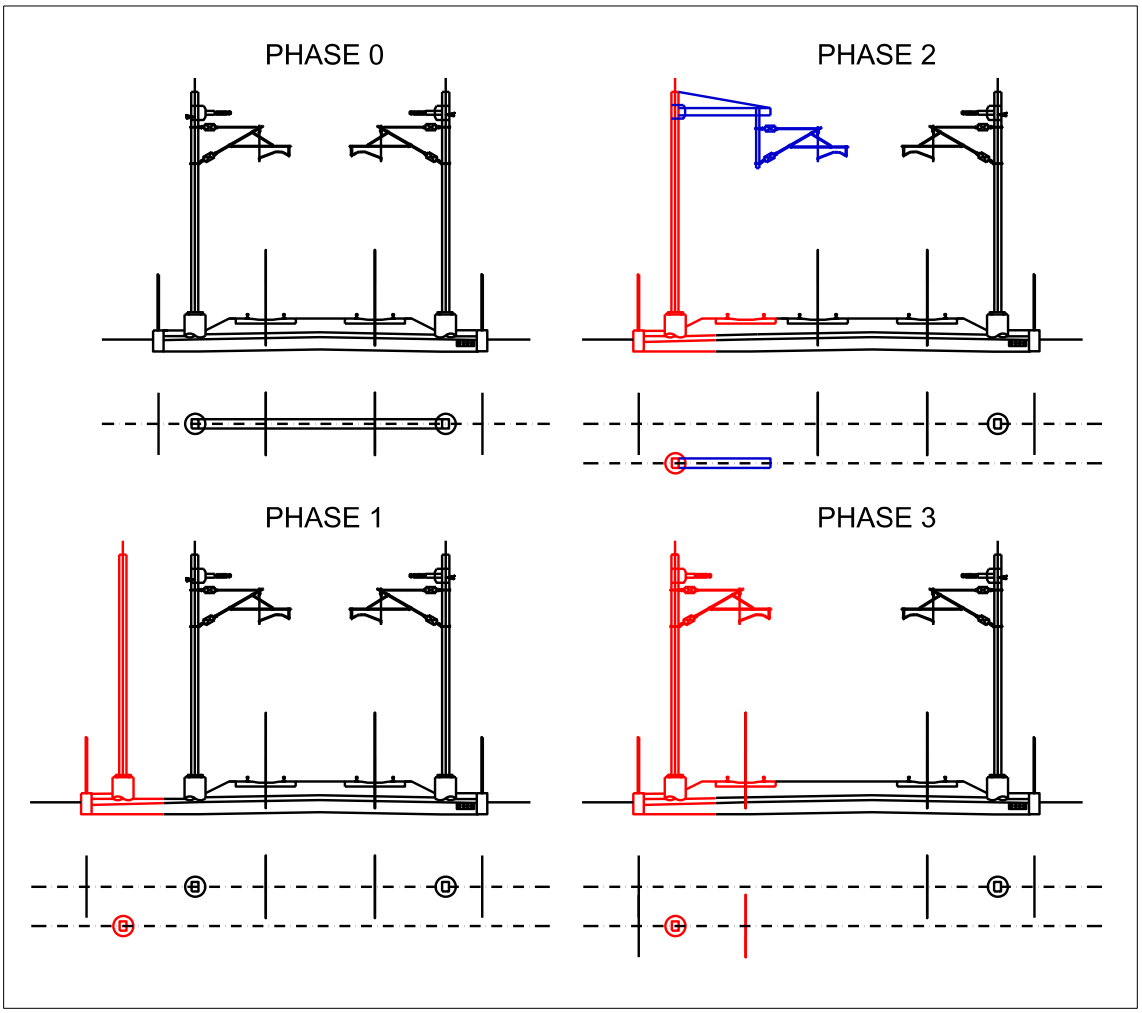

Figure 5. Classification of actions in the horizontal layout

3.2 Actions in elevation

Actions needed in elevation are required due to variation of the longitudinal profile of the new track adapted for high speed service and the existing one.

The required action on the track related to the elevation depend directly on its position in the plant and will define the actions to take. Three possible cases is possible define according to lateral displacement:

- **Case 1: When lateral displacements of the track is between 0 and 1 ft.**

  The axis of the future track is located at a horizontal distance lower than 1ft from the current one in these cases. In this case, there is no variation of the railway grade extension, that is, the cross section is practically the same.

  In turn, this case is subdivided into the following cases:

- *Raising of the longitudinal profile:*

Depending on the proposed profile changes, the thickness of the existing ballast layer and the existing platform characteristics, the following cases are distinguished:

- Adjust by tamping the existing ballast layer, valid for increases in elevation of up to 0.01 ft.
- Adjustment by tamping with addition of ballast for elevations between 0.01 and 0.167ft.
- Overall conditioning of the entire section, including the trackbed and the rest of the layers, for greater elevations.

- *Lowering of the longitudinal profile:*

- Adjust by tamping the existing ballast layer, valid for decreases in elevation of up to 0.01 ft.
- Removal of ballast for reductions between 0.01 and 0.05ft.
- Rebuilding of the entire section, including the trackbed and the rest of the layers, for greater descents.

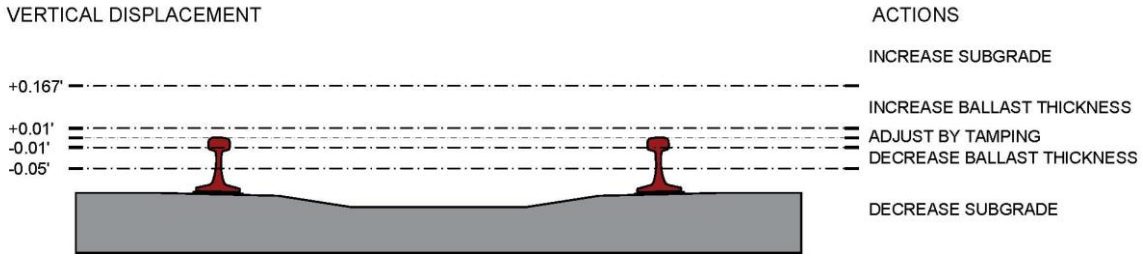

Figure 6. Actions in section for variations in vertical alignment

- **<u>Case 2: When lateral displacements of the track is between 1 and 21.34 ft.</u>**

The axis of the future track is located at a distance between 1 and 21.34 ft. from the old one in these cases.

Given the magnitude of the displacement, it is necessary to expand the existing railway grade. This means the cross section is significantly extended, not only in the upper layers of ballast, sub-ballast and form layer, but also in the embankment.

In turn, this case is subdivided into the following cases:

- *Raising of the longitudinal profile:*

  The enlarged area, where the extension of all the layers mentioned above will be carried out regardless of the amount of elevation change experienced by the longitudinal profile.

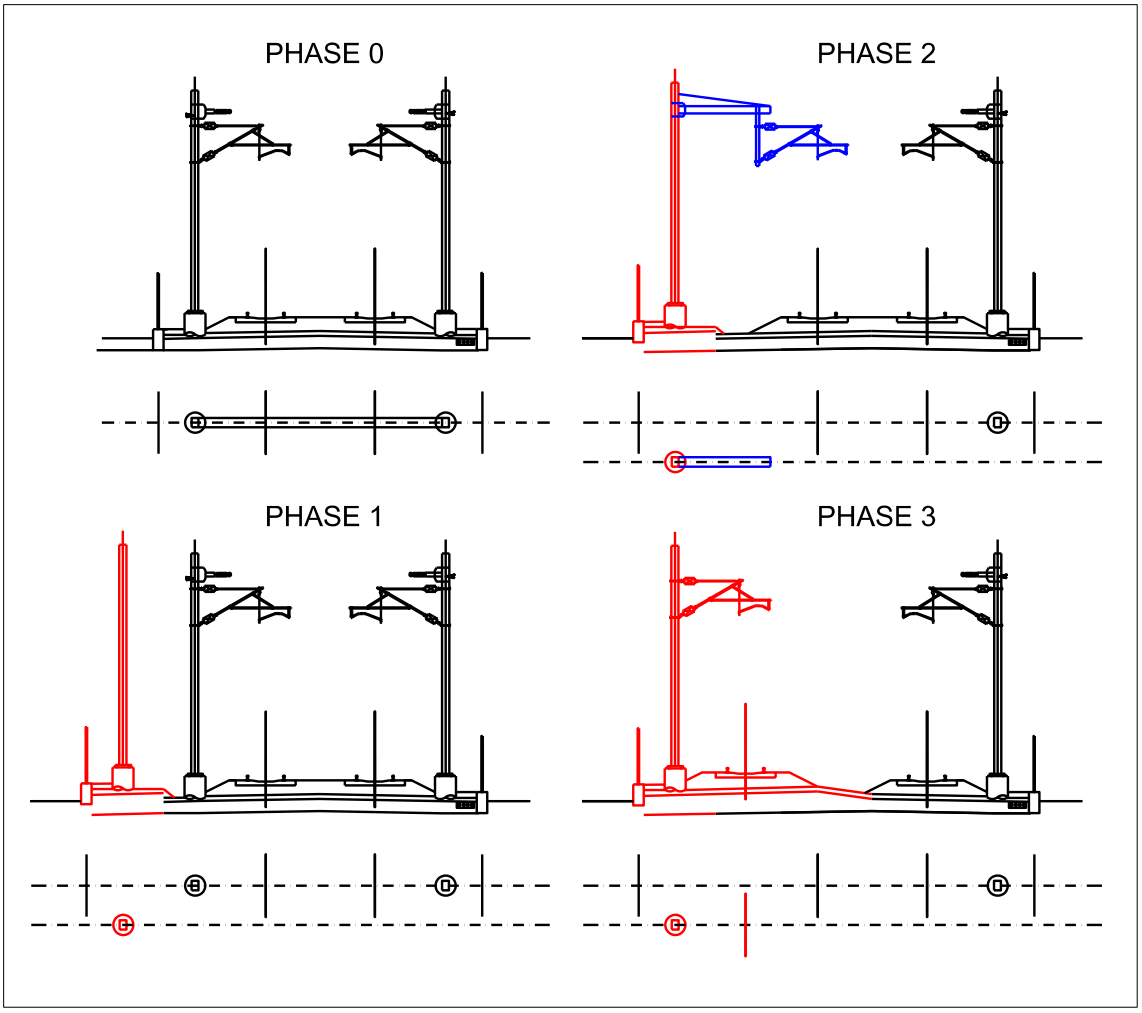

Figure 7. Phases of works for the ascent of the longitudinal profile

- *Lowering of the longitudinal profile:* In this case, it is necessary to study the current railway grade status, measure the thickness of the current ballast, sub-ballast layer, and determine the necessary actions to adapt it to the future situation of the new longitudinal profile.

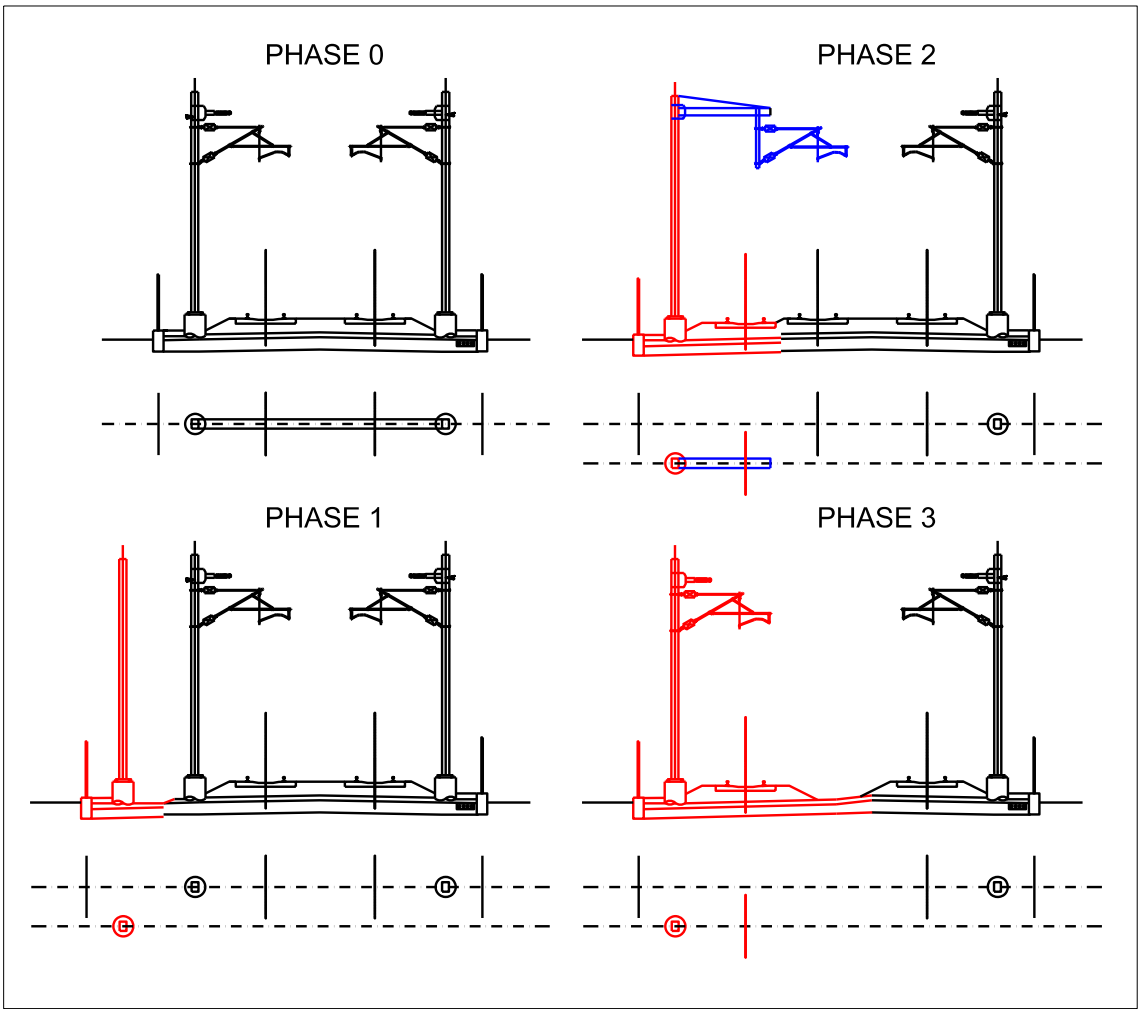

Figure 8. Phases of works for the descent of the longitudinal profile

- **<u>Case 3: When lateral displacements of the track is greater than 21.34 ft.: No influence:</u>**

  In these cases, given the magnitude of the displacement in horizontal, the variation of longitudinal profile is irrelevant since they can be considered independent and, will executed separately.

3.2.1 Impacts on the Existing Traffic

The impacts on traffic will depend on the magnitude of the lateral and vertical displacements of the track from the existing situation to the future situation and the length of the section for the construction area.

- **Lateral displacements of the track between 0 and 1 ft. without subgrade affectation**

  The impact on the existing traffic in this case is minimal since there´s no need to act on the railway subgrade or the catenary poles, just adapting the brackets for the repositioning of the contact wire.

  The works will be carried out during the Work Window hours established in the SECTION 01040. WORK HOURS AND TRACK ACCESS of the CalMod Design-Build Electrification Services and all the restrictions there mentioned.

  The only effect on traffic will be a limitation of the speed of the railway traffic during the time of action on the track.

- **Lateral displacements of the track between 0 and 1 ft. and lowering.**

  The impact on the existing traffic in this case is greater than in the case of raising of the track. Depending on the thickness of the existing ballast layer, it is likely the existing railway subgrade will be modified, so the construction activities carried out will be greater and require substantial time to complete.

  As in the previous case, the works will be carried out during nighttime periods or the weekend, with the restrictions mentioned above.

  The only effect on traffic will be a limitation of the speed of the railway traffic during the time of action on the track.

- **Lateral displacements of the track between 1 and 10 ft.**

  In this case, the relocation of the track will require the extension of the railway subgrade and removal of the catenary poles, with the following effects on traffic conditions:

  - Speed limits on railway traffic over the affected track, during the time of action.
  - The existing track and future one will share ties, so the extension of the existing railway subgrade and the lateral displacement of the track itself will be carried out during railway traffic cuts, at night or during the weekends.

When the future track is lower the railway subgrade is affected, so the construction activities will be drawn out for a longer time causing a greater impact on the current railway traffic.

Maintaining service requires the setup of a provisional electrification system, suitable for the current and future situation.

- **Lateral displacements of the track between 10 and 21.34 ft.**

  As in the previous case, the relocation of the track will require the extension of the railway subgrade and removal of the catenary poles. In addition, the maintaining service will require the assembly of a provisional electrification system.

  In this case, the work will be carried out outside the safety area, so it is possible to extend the existing railway subgrade and to build a new track without affecting the railway traffic. Only the establishment of speed limits due to the presence of construction will be necessary.

  Therefore, the only limitation to traffic will be during the execution of the connections with the existing track that must be made during railway traffic cuts in nighttime periods.

- **Lateral displacements of the track greater than 21.34 ft.**

  Since in this case the future track is more than 21.34 ft from the previous position, the execution of the new railway subgrade is completely independent of the old one. It is not necessary to remove the existing catenary poles in this case.

  Therefore, the only limitation to traffic will be during the execution of the connections with the existing track that must be made during railway traffic cuts in nighttime periods or during the weekend.

3.3 Turnouts

Along the route between Scott Boulevard and Gilroy, there are a large number of turnouts. Because of the track adaptation for high speed, the existing turnouts may be removed, displaced or kept in their position. Construction related to turnouts can be categorized as follows:

- **Removal of an old turnout**. It is the simple elimination of a turnout present in the current track and the subsequent track replacement.

- **Insertion of new turnout**. It consists of the insertion of a new turnout on the existing track.
- **Replacing a turnout**. In this case it is a matter of replacing one turnout with different type of turnout, even if the horizontal and vertical layout does not suffer any modification.
- **Relocation of a turnout**. It is the opposite case, in which the same device (same model) is still valid, but due to modifications in the horizontal and vertical layout, its relocation is necessary.

All the activities that affect turnouts will be carried out during extraordinary traffic cut periods. In order to reduce the impact period, pre-assembly of turnouts will be made at assembly bases. Once pre-assembled, they will be carried by special track machinery to the permanent location.

While the assembly work takes place, the speed limits will be maintained.

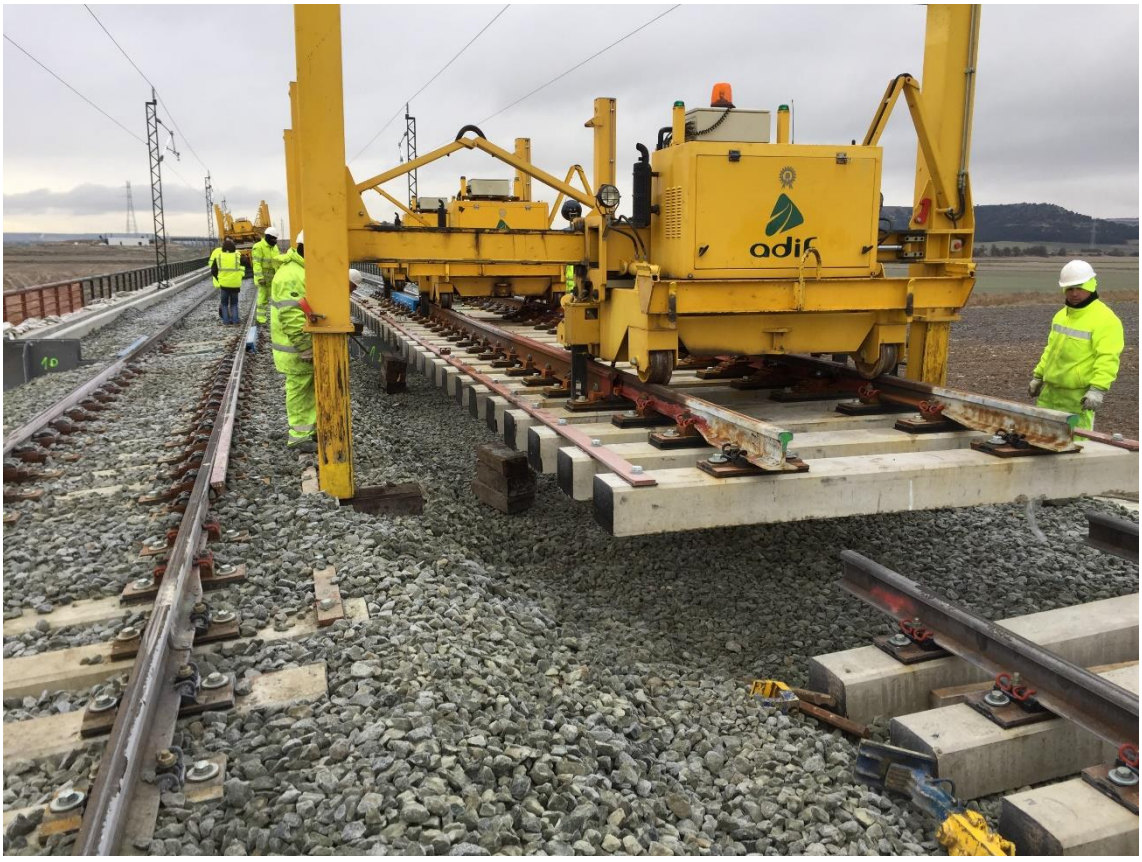

Figure 9. Assembly on the track of a pre-assembled turnout

In the event that the geometry of the track sections adjacent sections to a turnout undergoes modifications, it will be necessary to place the track in its definitive position to allow the turnout to be interested in its' final position during an extraordinary traffic-cutting period.

If it is necessary to move a track turnout either in horizontal or in elevation, it is recommended to disassemble it and replace it with a provisional track. This provisional track along with the adjacent sections will be placed in their definitive position and later the turnout will be assembled in its final location. This working cycle assumes the rail traffic diversion will be suspended while the provisional track is installed.

Figure 10. Transportation of a pre-assembled turnout

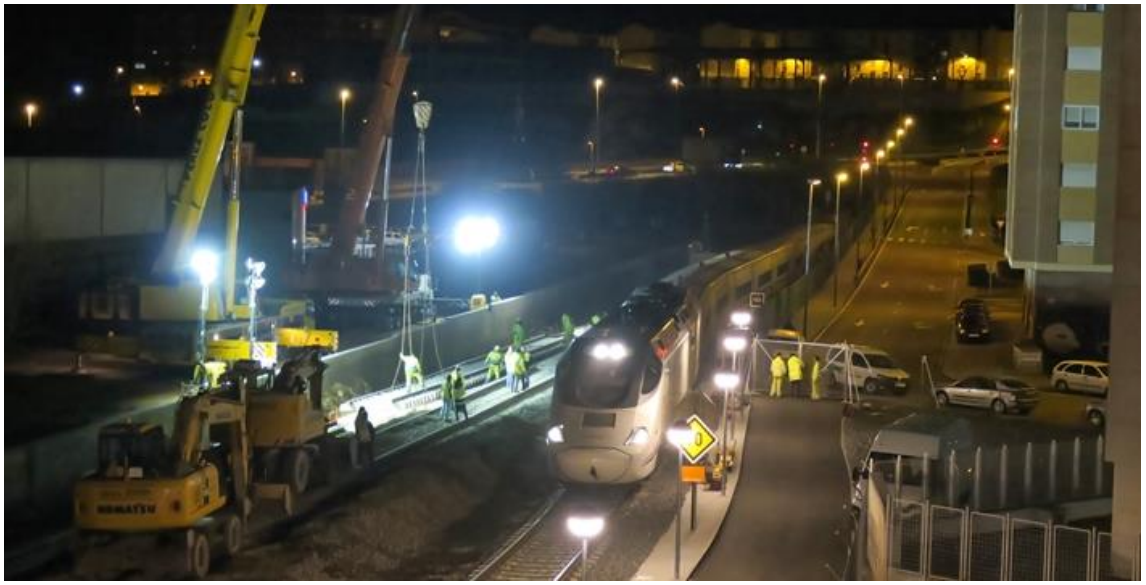

Figure 11. Assemble of a pre-assembled turnout with cranes

3.4 Actions on Platforms.

The modification of the main track and yard track alignments in stations, require corresponding modification in the platforms.

Any little track displacement, either in horizontal, elevation or in both, implies a corresponding one in the platforms, due to the need for keeping the safety and functional distances.

Figure 12. Modifications to platforms

3.5 Actions on At-Grade Crossings.

Throughout the corridor, a series of at-grade crossings allow connection between the adjacent areas and populations located on either side of the corridor. Modifications to the track require these crossings be studied, verifying the need of their adaptation to the new tracks and modification of existing horizontal layout and longitudinal profile.

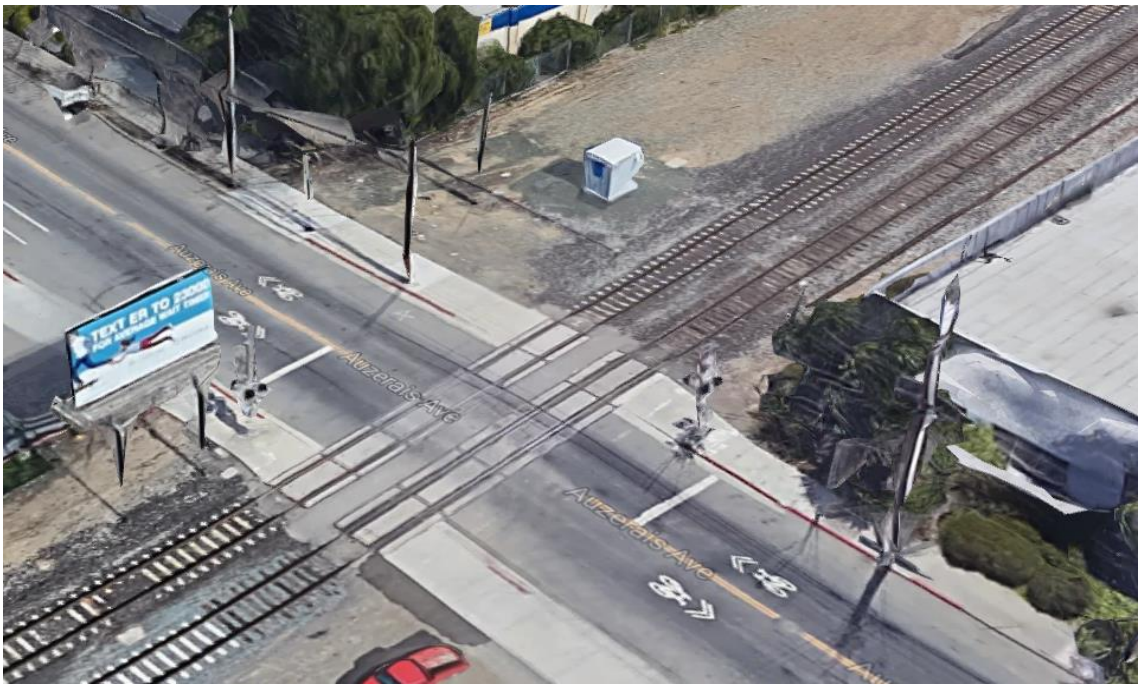

Figure 13. Typical at-grade crossing in railway line San Jose to Gilroy

The at-grade crossings that must be modified are those that will be affected by additional tracks and/or displacement of the existing track exceeding the following limits:

- Lateral displacements of the track between 0 and 0.02 ft.
- Variation of the longitudinal profile (either raising or lowering) between 0 and 0.01 ft.

Figure 14. Construction of at-grade crossing

4. SPECIAL CASES

There are seven special cases in Scott Boulevard to Gilroy constructability analysis who completed the tracks adaptation:

- Appendix A Electrification
- Appendix B Jacked box undercrossing
- Appendix C Micropiles wall undercrossing
- Appendix D Wildlife crossing under Monterey Rd
- Appendix E Grade crossing analysis
- Appendix F Alternative 4 Constructability analysis
- Appendix G Track shift works Scott Boulevard to CP Lick

These special cases are developed in seven independent appendix.

CALIFORNIA HIGH SPEED TRAIN PROJECT
CONSTRUCTABILITY ANALYSIS

APPENDIX A. ELECTRIFICATION

December 2018

prointec

APPENDIX A. ELECTRIFICATION

The purpose of this document is to describe the different procedures available to adapt the electrification of railway lines in use to modifications of their. The proposed methods start from the premise of not interrupting railway traffic.

In general, the catenary has a greater capacity for transverse displacements than the track itself. This is due to the existence of a series of tolerances that are listed below:

- Tolerance of the catenary supports
- Decentralization of the contact wire to avoid localized wear of the pantograph
- Pantograph tolerances

The sum of these tolerances, as a general rule, is estimated at one foot. This margin can be used to carry out transverse displacements of the track without being necessary to modify poles and gantries to re-electrify the railway line. In this case it would only be necessary to adjust the position of the contact wire.

When the displacement of the track is greater than one foot, it is necessary to move the supports inside the frames or construct new structures for the catenary adaptation. Figures provided in this document show the adaptation of the catenary system. They do not include the intermediate subphases of partial displacements of both the track and the contact wire.

The existing corridor is not electrified, but construction of the CalMod project in the near future will install electrification and control systems. Subsequently, the main tracks (currently used exclusively by Caltrain) will be adapted for High Speed services. This adaptation will mean changes in the existing track configuration, requiring relocation of both tracks and catenary system elements.

As a starting point, the section between Scott Boulevard and San Jose station are fully electrified and the stretch between San Jose and CP Michael only the main right track and the refuge tracks are electrified. In the future, all tracks will be electrified except MT-1 (UPRR track).

There are apparent benefits to coordinating the CalMod and High-Speed Rail projects, so that locations were fixed elements (poles and gantries) can be designed compatible for both projects would be the most economically beneficial and ensure the least amount of railway service interruption during construction. The approach means that when High-Speed Rail is implemented the gantries will be perfectly valid and only an intermediate

period it will be necessary to relocate the track and the catenary supports. This case is called as process 0.

For the remaining situations the following describes potential construction processes:

Process 1. The first procedure is where the OCS portals are not able to house both track distributions (existing and future) so the portals must be enlarged. Depending on portal structural resiliency, it could be enlarged or directly substituted.

The process of portal enlargement is as follows:

Phase 1: New OCS pole placement. It must be aligned with the existing one.

Phase 2: Portal beam, temporary support installation.

Phase 3: Removal of the existing OCS pole. Portal beam enlargement and connection with the new pole.

Phase 4: Commissioning of the railway line.

Phase 5: Displacement of the tracks and of the OCS supports to their final location.

Phases 2, 3 and 4 must be made in the same night-time period with traffic cut. The temporary support used in phases 2 and 3 can be replaced for a crane.

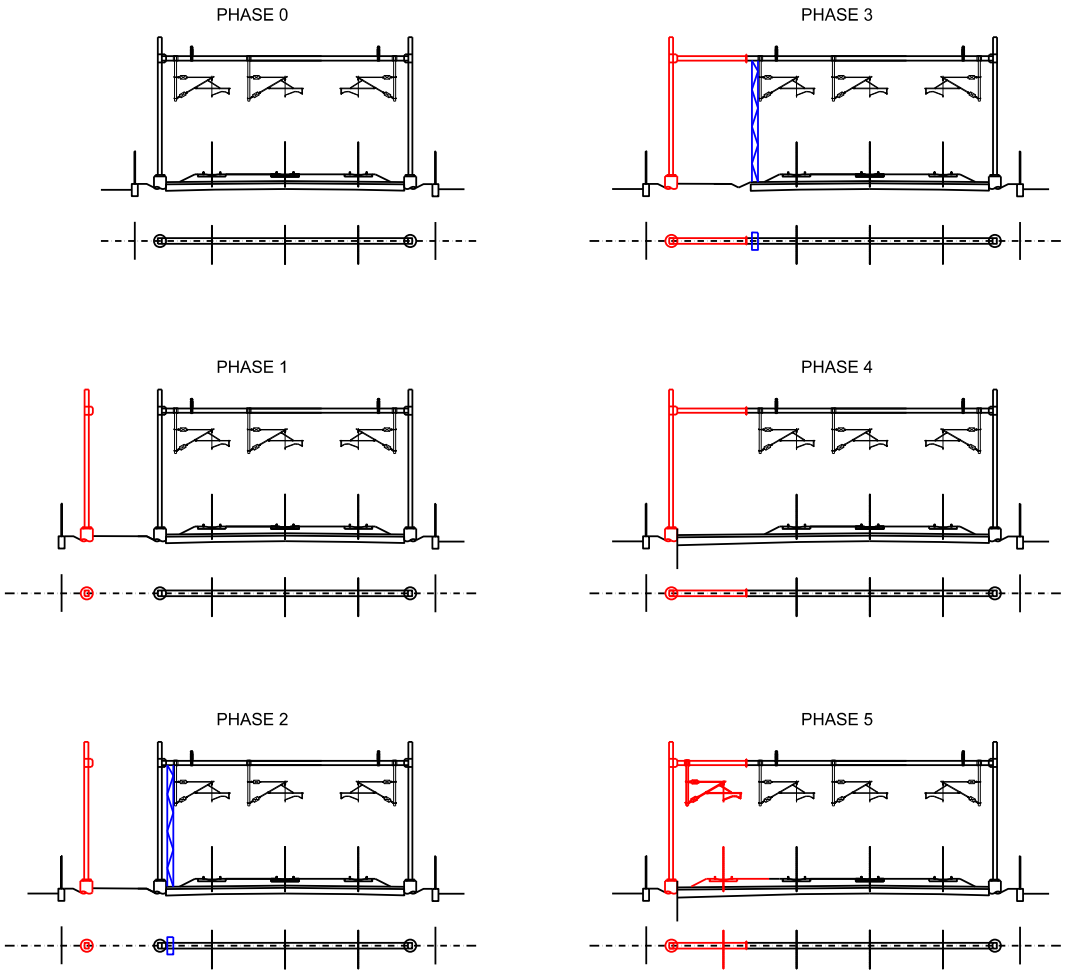

Figure 1. OCS portal beam extension

Process 2. The second process consists of designing enough long OCS portals that are able to house both track distributions (existing and future). In this case, it is necessary to build a flexible gantry located between temporary poles. This example is also suitable for the replacement of the portal beam. The working stages are:

Phase 1: Install temporary poles, outside of existing.

Phase 2: Flexible gantry is laid between temporary poles.

Phase 3: OCS and flexible gantry are linked. Existing OCS supports removed.

Phase 4: Existing OCS portals removed.

Phase 5: Placement of the new tracks in its final location.

Phase 6: Placement of the new portal in its final location.

Phase 7: Temporary flexible, gantry removed.

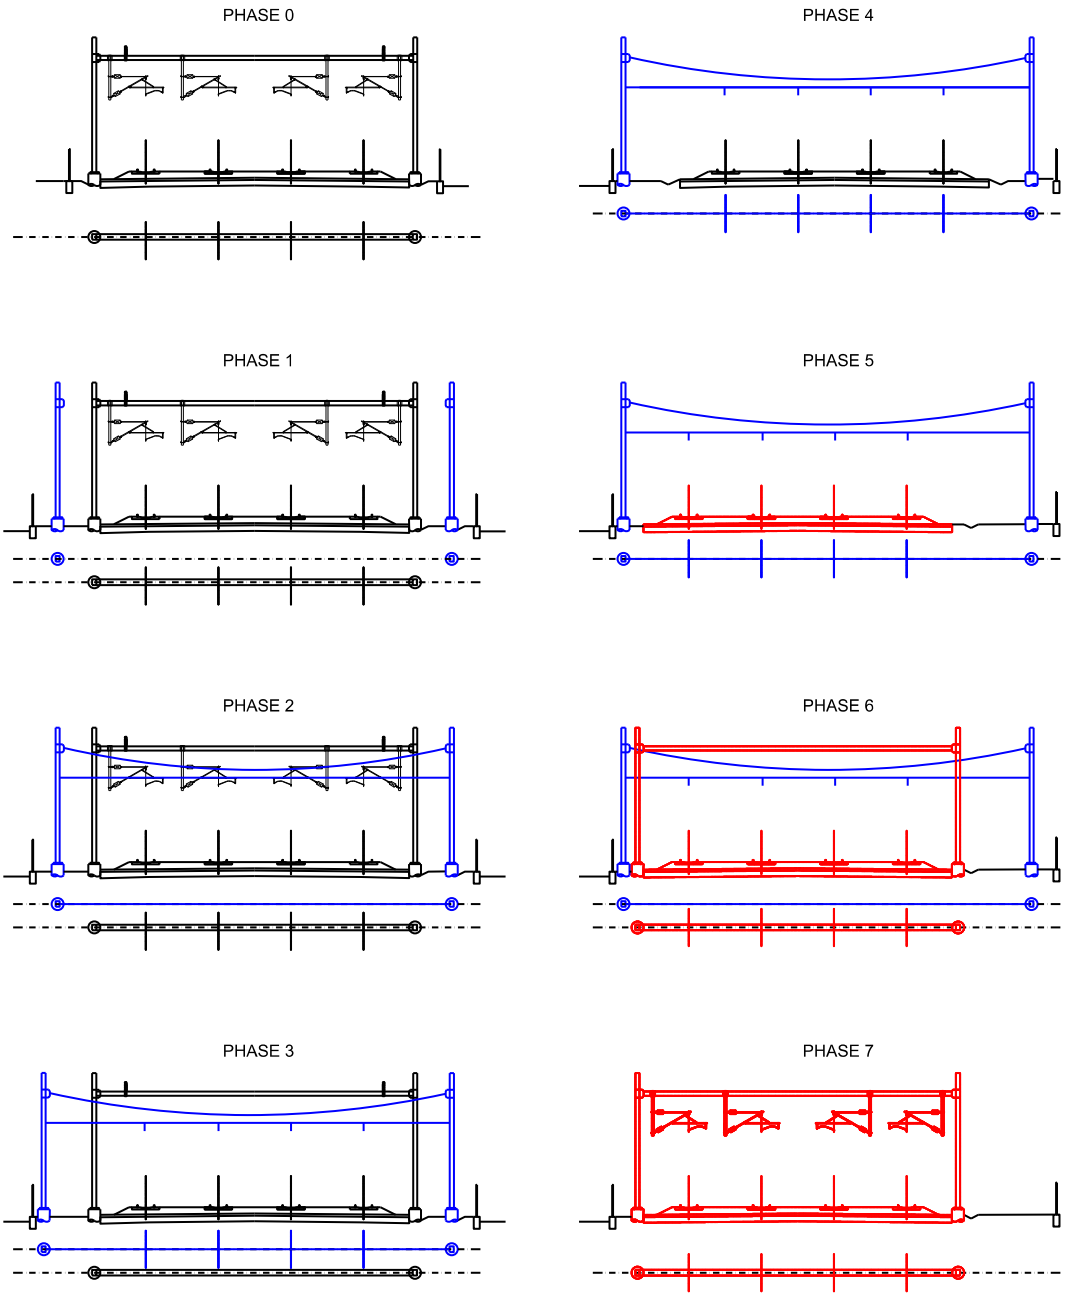

Figure -2. OCS portal replacement

Process 3. OCS portal assembly

Phase 1: Placement of the final, parallel pole and track.

Phase 2: Placement of the final OCS support.

Phase 3: Placement of the OCS portal in its final location. Placement of temporal OCS wire.

Phase 4: Placement of the final OCS wire. Removal of the existing OCS pole and temporal OCS wire.

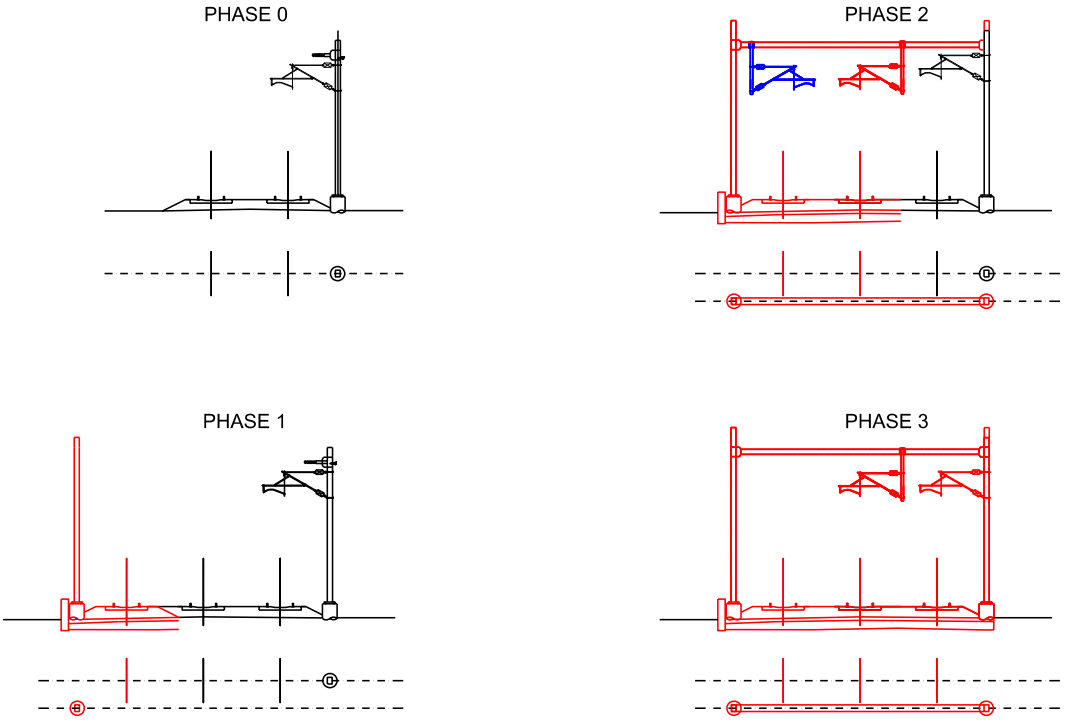

Figure 3. OCS portal assembly

Process 4. Displacement of poles outside the future clearance and displacement of two tracks.

Phase 1: Assembly of a new, parallel pole in a temporary placement

Phase 2: Removal of the existing OCS pole. Positioning of the support for two cantilevers and placement of the cantilever next to the pole.

Phase 3: Removal of the cantilever to displace and assembly of the second cantilever over its support.

Phase 4: Removal of the existing pole. Assembly of two, new parallel poles in their permanent location.

Phase 5: Placement of cantilevers. Removal of the temporary pole.

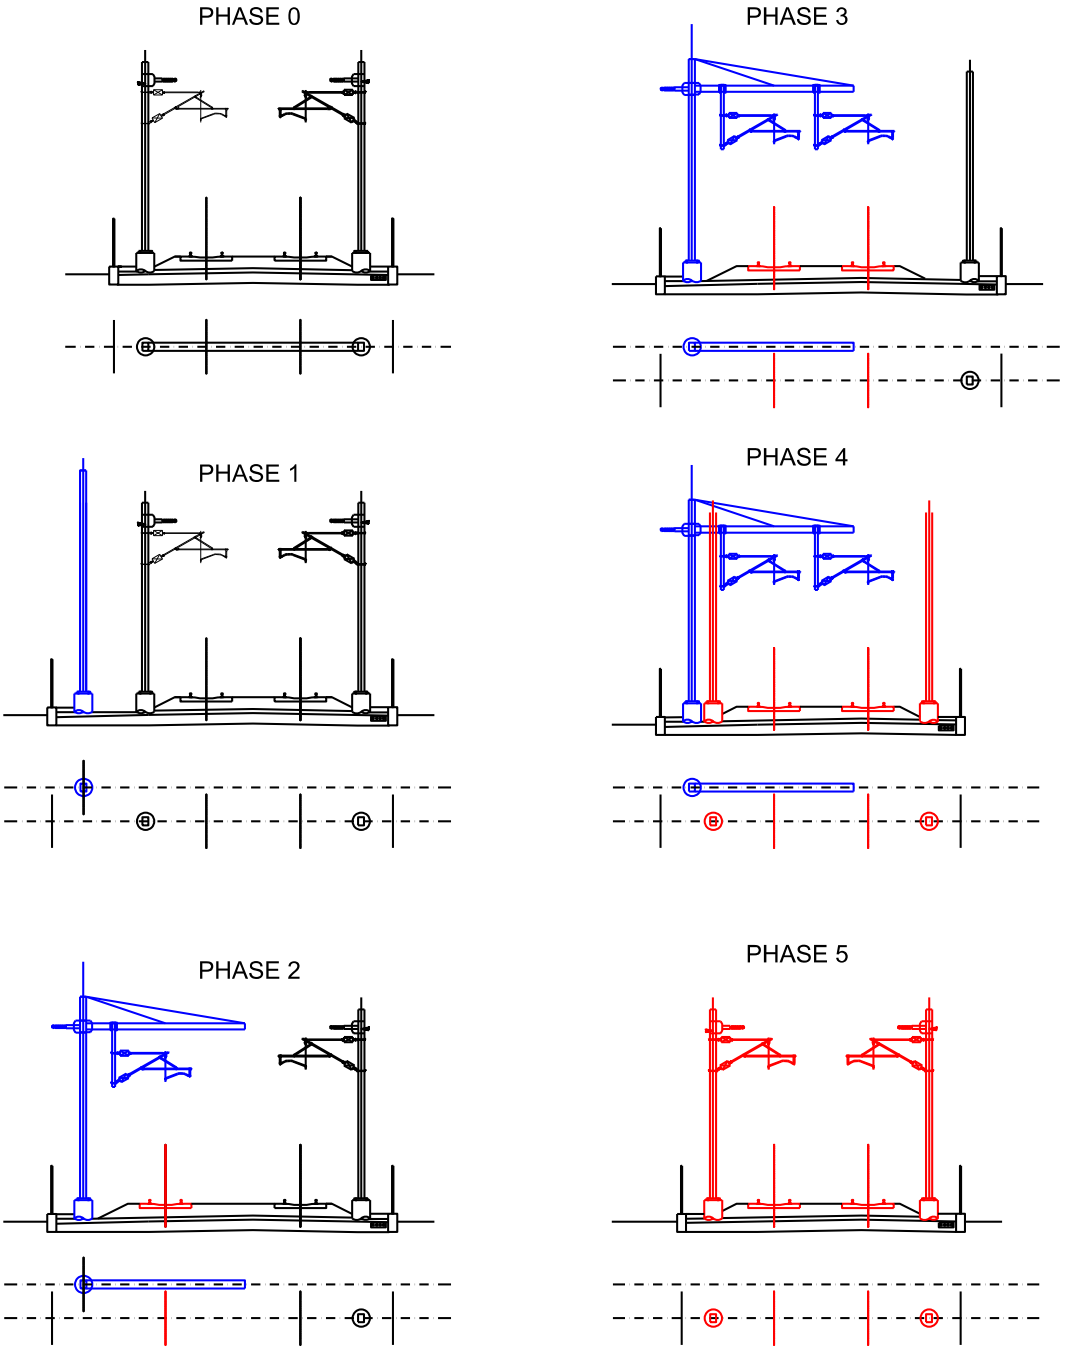

Figure 4. OCS poles displacement

In the cases described above, temporary elements are used. The foundations of these temporary elements can be made in the same way as a permanent element (using a pile) or using a temporary foundation simply supported on the existing ground.

Figure 5. OCS temporary foundation

CONSTRUCTABILITY ANALYSIS

APPENDIX B. JACKED BOX UNDERCROSSING

o

prointec

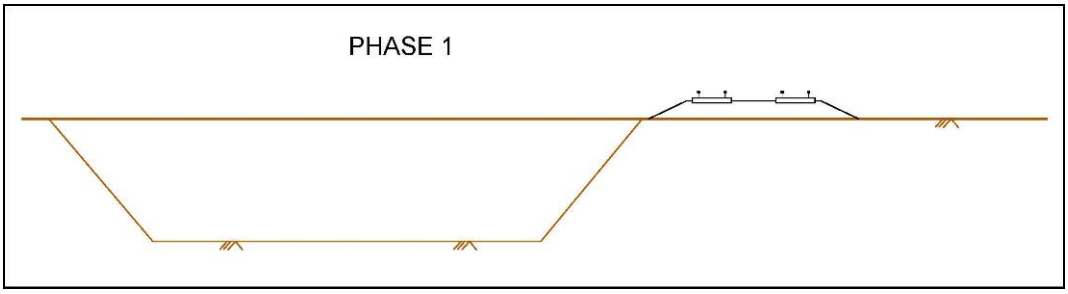
APPENDIX B. JACKED BOX UNDERCROSSING

The method of constructing an underpass by continuous jacking generally consists of the construction of the structure in an area adjacent to the installation site and then hydraulically pushing the structure into its final position at right angles to the track, with minimum disturbance to both rails and train circulations.

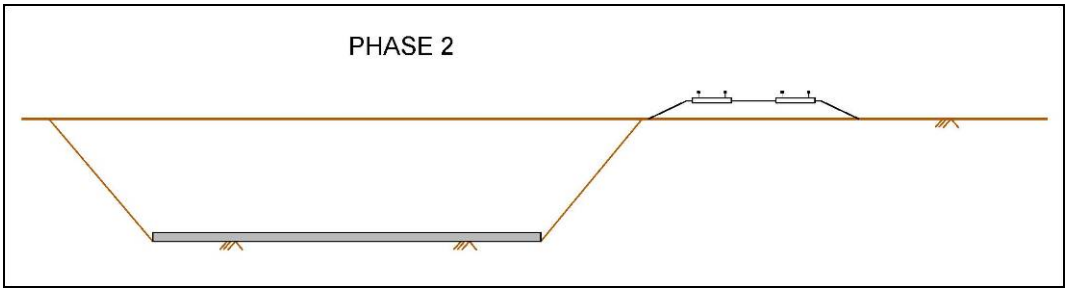
The structure is built on a concrete launch pad in the vicinity of the track and on obtaining suitable strength, is then jacked by hydraulic cylinders; which transfer the stresses to a reaction frame or the ground itself. The excavation is simultaneously carried out from within the structure or box and there is, subsequently, no risk to track stability.

The construction process is:

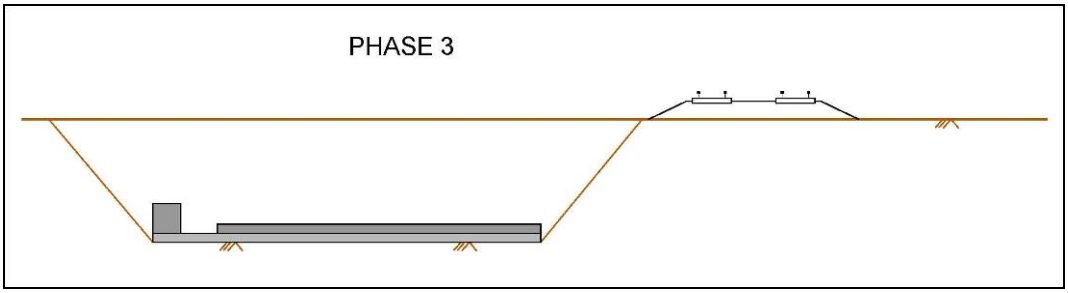
Phase 1: Ground excavation adjacent to the structure's permanent location.



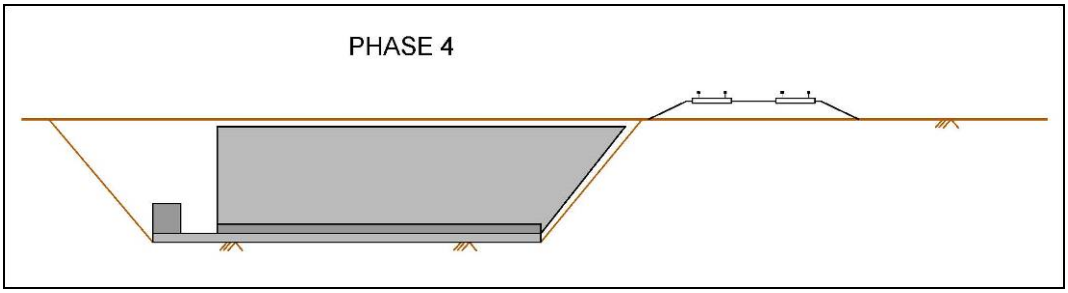
Phase 2: Concrete slab and launch pad construction. The main goal of this slab is to support box movement. This slab must be smooth and covered with a polyethylene sheet to ease the movement of the structure (Figure 1, 2 and 3).



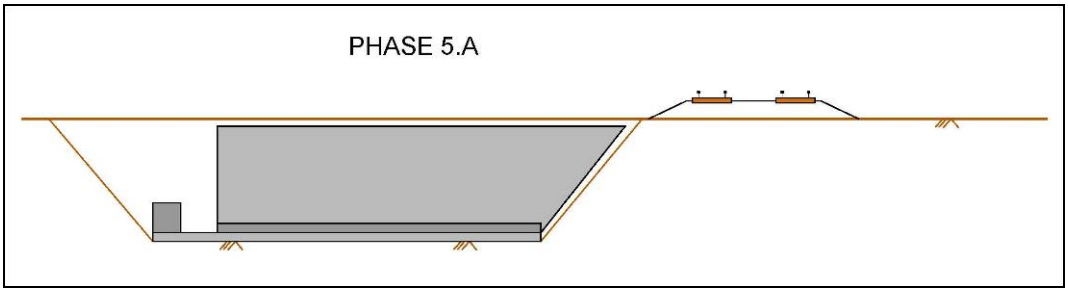
Phase 3: Construction of guiding walls. These are needed to assist with box alignment while jacking (Figure 4 and 5).

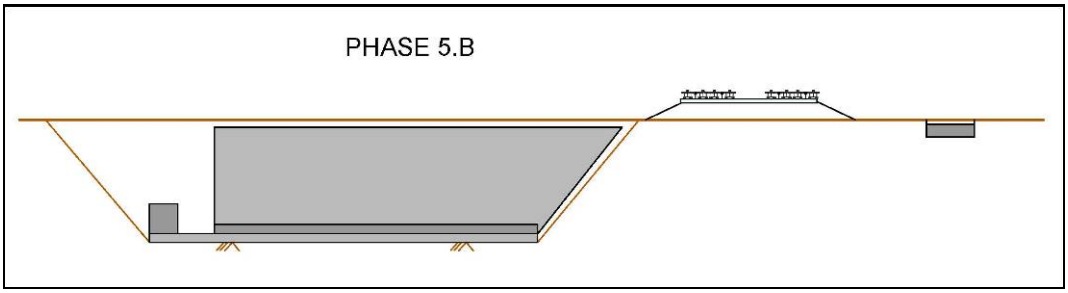


Phase 4: Reinforced concrete box construction. Box should be shaped as shown in the following figure to the jacking process (Figure 6, 7 and 8).

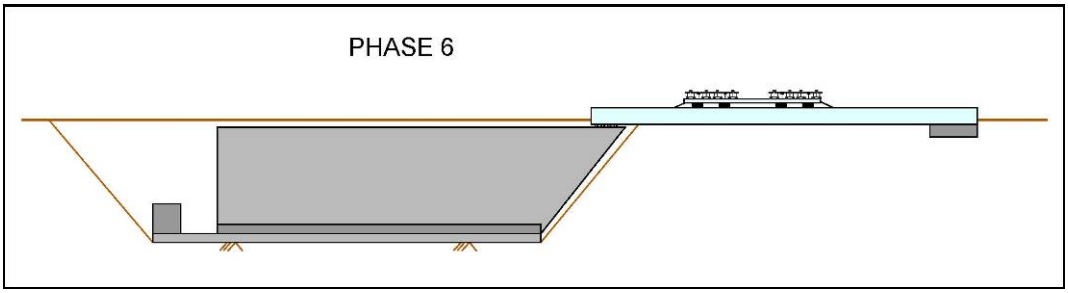


Phase 5: The subgrade will suffer limited deformations during the box movement, so it is necessary to change concrete ties to wooden ties, to provide flexibility. Additionally, a reinforcement of the track, parallel to the box movement, will designed by a special fastening system to unify rails with adjacent steel profiles to add inertia. (Figure 9, 10 and 11). Construction of a provisional foundation parallel to tracks.





Phase 6: Steel beams should be placed parallel to the track ties and placed every 6 feet. These beams are supported by the box, the provisional foundation and the existing ground. Support over the box is made by a roll in order to maintain the beam placement during works. Traffic is maintained in this stage but speed is limited (Figure 12, 13, 14 and 15).



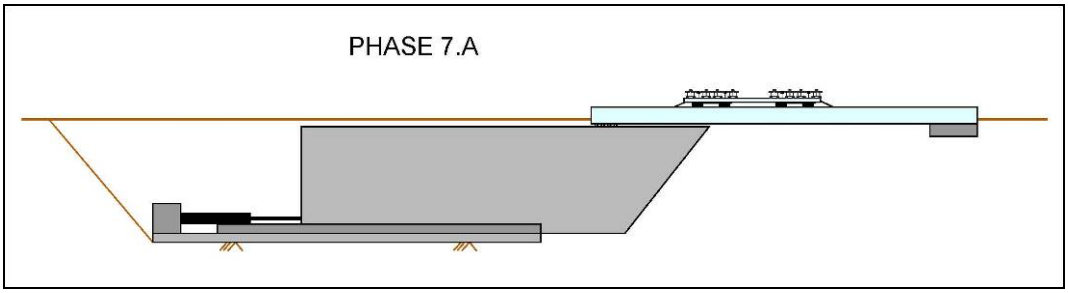
Phase 7: Box jacking by a hydraulic jacks series. This stage is subdivided into:

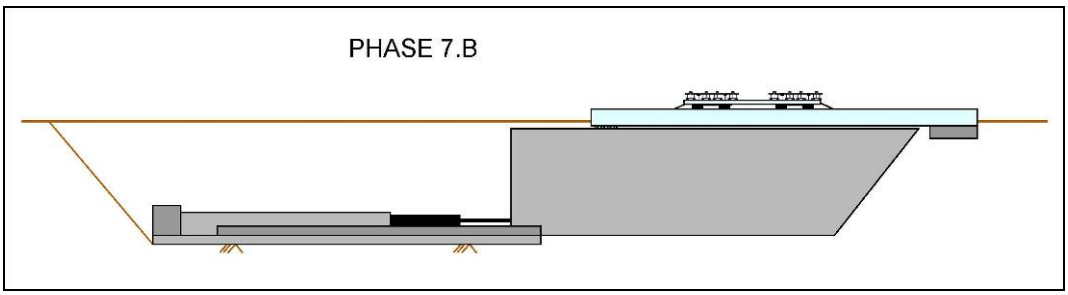
a. Excavation under the existing tracks during nighttime closures, for tie and beam placement.

b. In-box excavation. Rate of excavation is directly related with daily rate of box jacking (Figure 16 and 17).

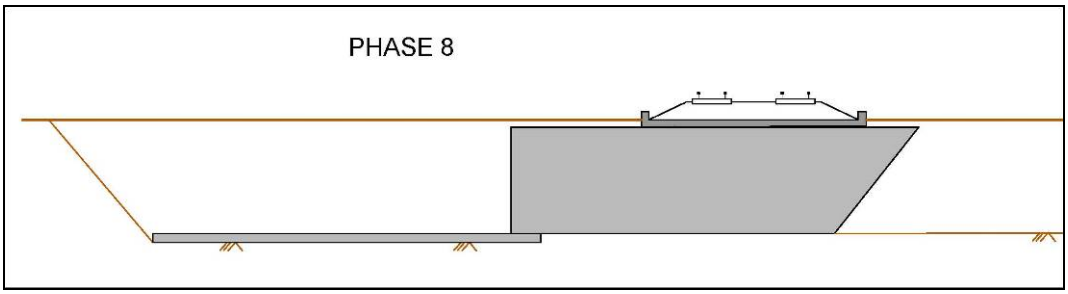
c. Jacking. Hydraulic jacks transfer homogeneous pressure to the box; which slips along the concrete slab and hammers itself in the soil (Figure 18, 19, 20, 21 and 22).

d. Left space concreting to support jacks when box has moved enough.

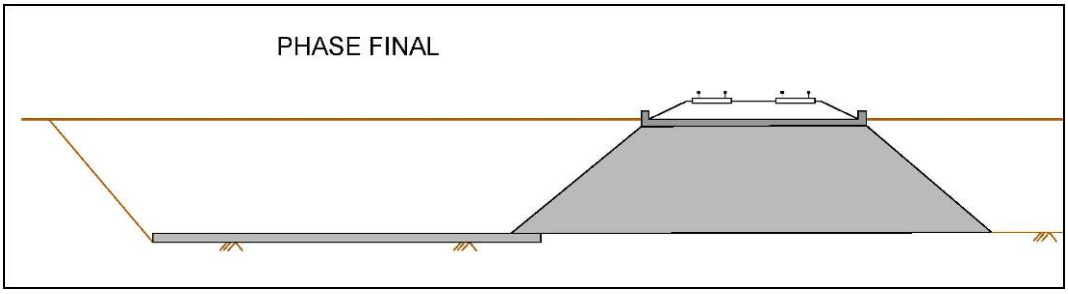




Phase 8: Material spreading between railway superstructure and box.



Phase final: Reshape the box to its final shape and landscape (Figure 23, 24 and 25).



Following pictures show several generic stages during works and the final result.

APPENDIX C MICROPILES WALL UNDERCROSSING

December 2018

prointec

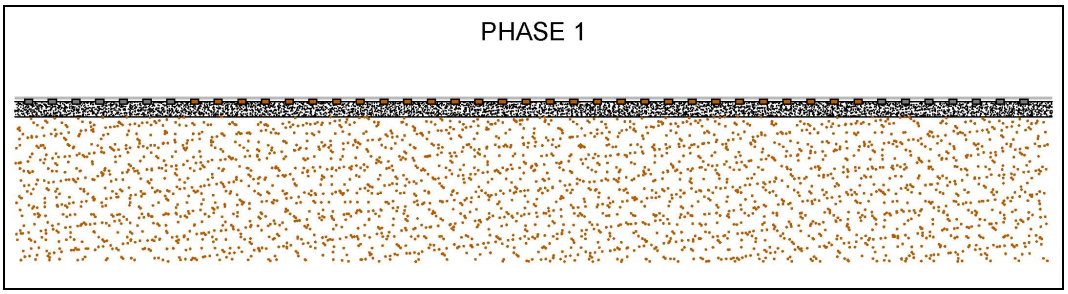
APPENDIX C MICROPILES WALL UNDERCROSSING

An alternative method to build an underpass without affecting the railway traffic is based on the execution of two groups of two parallel micropiles walls from the track. The object of these walls is to achieve two safe working places without needing a railway traffic cut for the execution of the lateral walls of the underpass. When the lateral walls are built, it is possible the positioning of the precast top slab during an extraordinary traffic-cut that may take time during a weekend time.

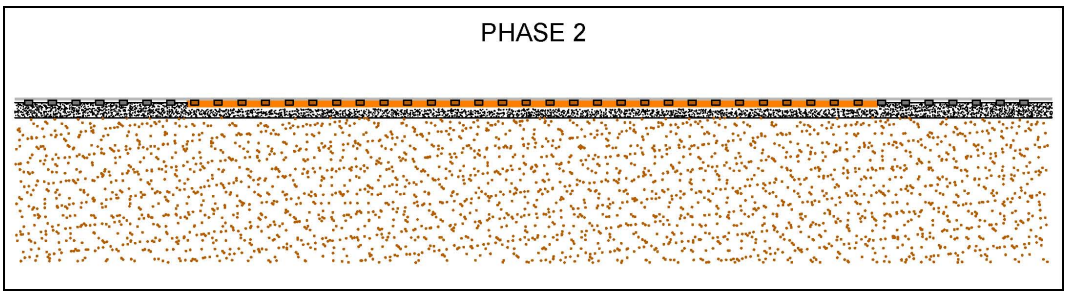
Working processes are:

Phase 0: Current situation

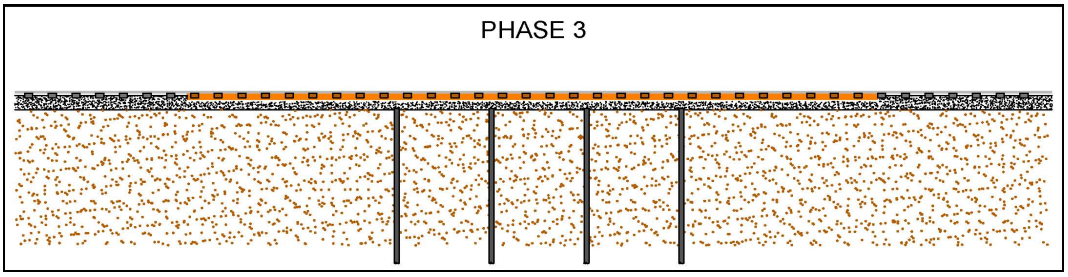
Phase 1. Replacement of the concrete sleepers for wooden sleepers. This activity will be carried out in a night traffic interruption period and when the railway traffic is restored a speed limit of 20 mph will be established.



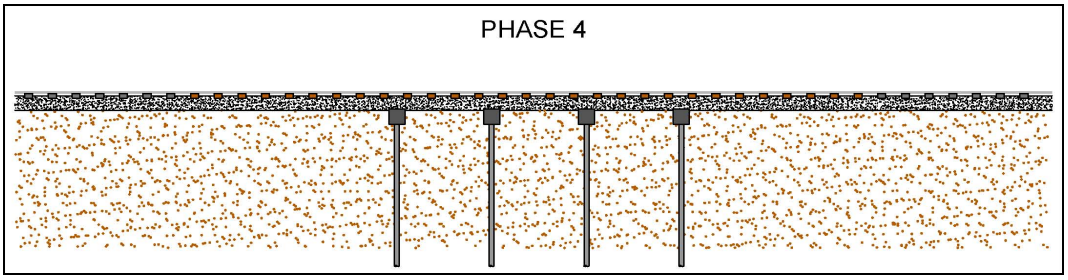
Phase 2: Track planking. In this phase, a track planking is placed in the space between rails. The aim is build a workable building surface for the micropile-driving equipment without disturbing the railway traffic and without affecting the existing rail track components. This activity will be carried out in a night traffic interruption period and when the railway traffic is restored a speed limit of 20 mph will be established.



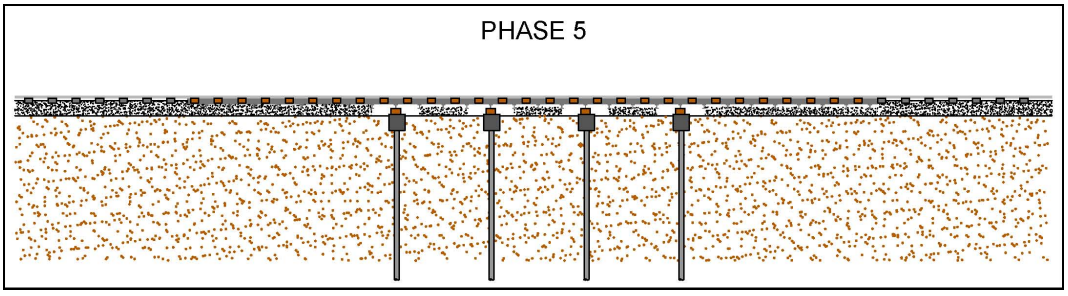
Phase 3: Construction of two groups of two micropiles retaining walls. Micropiles will be installed from the construction plank, through the ballast bed. Micropiles outside of safety area can be made when railway traffic is active. Micropiles inside of the safety area must be installed during a traffic interruption period and when the rail traffic is restored, a speed limit of 20-mph will remain in place.



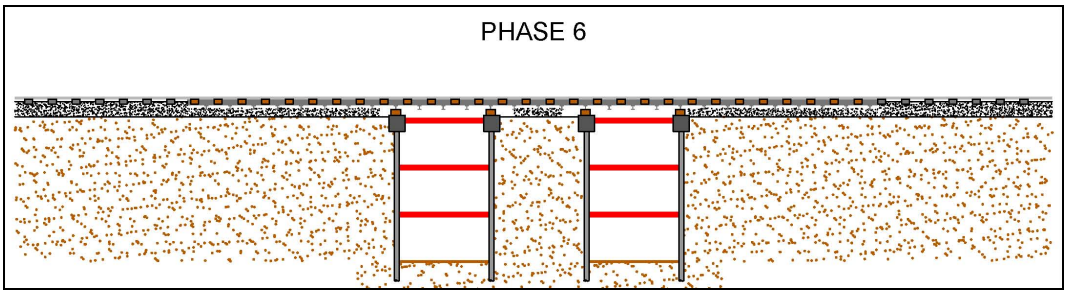
Phase 4: Building of cap beams between the micropiles. In this phase, it is necessary to remove some of the ballast for building the cap beams. This activity will be carried out during a night traffic interruption period and when the railway traffic is restored a speed limit of 20-mph will remain in place.



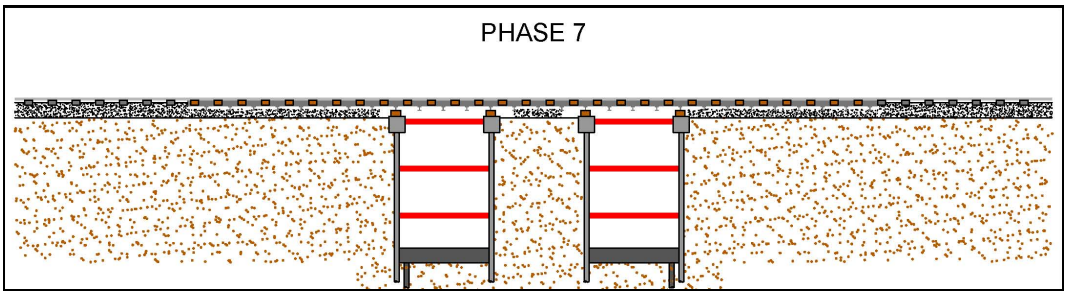
Phase 5: Reinforcing of the existing tracks. After the completion of the cap beams between the micropiles, the rails are reinforced by the grouping of rails. These groups of rails are supported over the cap beams. This reinforcement allows small segments of track to remain active without ballast (at maximum 6' section) but with restrictions in traffic speed. This activity will be carried out during a night traffic interruption period and when the railway traffic is restored a speed limit of 20 mph will remain in place.



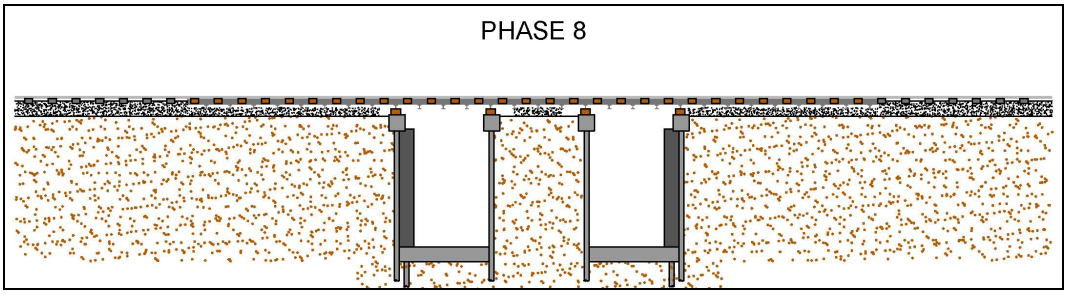
Phase 6: Excavation between retaining walls and positioning of provisional struts between retaining walls. This activity is compatible with railway traffic if safety measures are implemented. The 20-mph speed limit will remain in place.



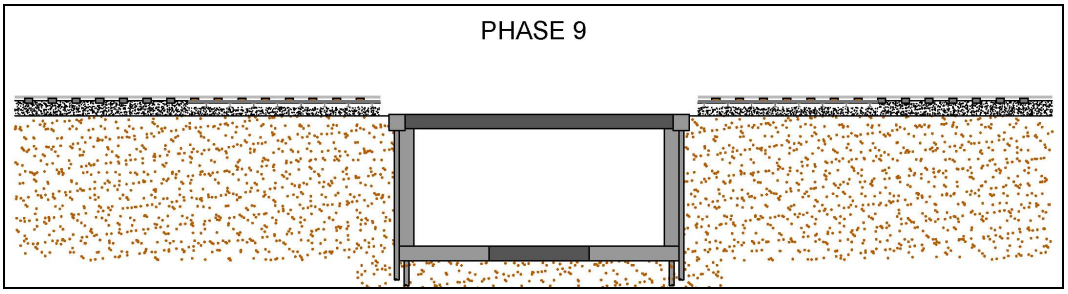
Phase 7: Partial construction of the underpass foundation slab. This activity is compatible with railway traffic if safety measures are implemented. The 20-mph speed limit will remain in place.



Phase 8: Erection of the underpass lateral walls. This activity is compatible with railway traffic if safety measures are implemented. The 20-mph speed limit will remain in place.



Phase 9: Track removal in the working area. Excavation of the soil between the lateral walls of the underpass. Completion of the foundation slab and positioning of the precast top slab of the underpass. This activity is incompatible with railway traffic, so it is necessary to make an extraordinary traffic-cut, anticipated to be a weekend closure.



Phase 10: Return tracks to their original state. This work must be made in a traffic interruption period. When this phase is finished, speed limits will be canceled.

APPENDIX D. WILDLIFE CROSSING UNDER MONTEREY RD

December 2018

prointec

APPENDIX D. WILDLIFE CROSSING UNDER MONTEREY RD

Index

1. WILDLIFE CROSSING UNDER MONTEREY RD 1

1. WILDLIFE CROSSING UNDER MONTEREY RD

One of the design alternatives of the HSR line between San Jose and Gilroy, uses the current corridor of the existing UPRR line. This corridor runs parallel to the Monterey Rd. The need to guarantee the transverse permeability of the future line, requires the execution of a series of wildlife crossings. These wildlife crossings will pass under the Monterey Rd and under the future HSR tracks.

The execution under the tracks will be carried out according to the dimensions of the construction element, by parts or following the methods proposed in Appendices B and C. The proposed methods for crossing under Monterey road are defined in the following appendix.

Monterey Rd is a road with 2 lanes per direction without a median. In order to maintain traffic, it is necessary to partially cut the road by reducing the traffic to a single lane or to make a temporary detour to maintain the capacity of the road. The choice of one system or another is given by the traffic intensity of the road and by the characteristics of the wildlife crossing (dimensions, precast concrete or executed on site). The proposed construction procedures are included below.

Wildlife crossings of exterior dimensions up to 10x10 ft.

In this case, for wildlife crossings with external dimensions up to 10x10 ft and with the hypothesis of a low traffic intensity. The most economic system is build the wildlife crossing by phases. Cutting a lane and placing the precast elements, once the elements are located it is possible reopening the lane of road.

The constructive phases of this process are:

1. Execution of the provisional detour of the road.
2. Excavation.
3. Concrete base.
4. Placing of the precast elements.
5. Fill.
6. Restitution of the road lane and signaling.
7. Opening of the road.

This process will be repeated as many times as necessary. The traffic detour will be adapted to the following scheme:

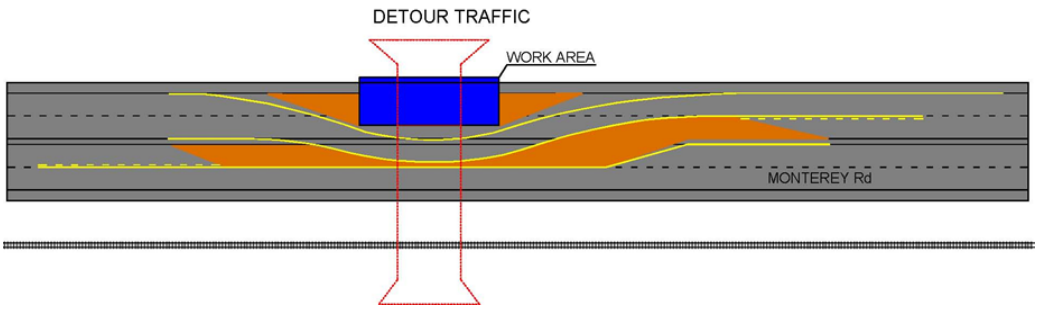

Figure 1. Detour traffic

The traffic detours will be adjusted to the progress of construction of the wildlife crossing. The direction of progress in the execution of the wildlife crossing will be from bottom to top to avoid problems with the accumulation of rainwater on the worksite.

For wildlife crossings of larger dimensions, the solution is complex. The solution to be adopted depends on multiple factors:

- Characteristics of the road. Widths, number of lanes.
- Traffic. The intensity of the traffic conditions the possibility of executing the temporary cut of one lane in each direction.
- Geotechnical characteristics of the soil.
- Height of the element to be built.
- Availability of land bordering the road for temporary detours

These factors will condition the constructive method. If it is possible to execute a traffic detour compatible with the excavation to execute, the best option is to excavate and execute the structure from bottom to top. In the case of not having enough space the alternatives go through the adoption of a constructive system that occupies the minimum. A system widely used in urban environments is known as Top-Down, the construction phases of this system are:

1. Partial cut of the road.
2. Execution of reinforced concrete diaphragm wall.
3. Execution of the upper slab.
4. Reopening the road.

These phases will be repeated the number of times necessary to form a top slab and continuous side walls. Once the upper slab of the wildlife crossing has been completed, there is no longer any impact on the Monterey Rd traffic. In order to complete the wildlife crossing the phases to be executed are the following:

5. Excavation under the upper slab
6. Execution of the lower slab

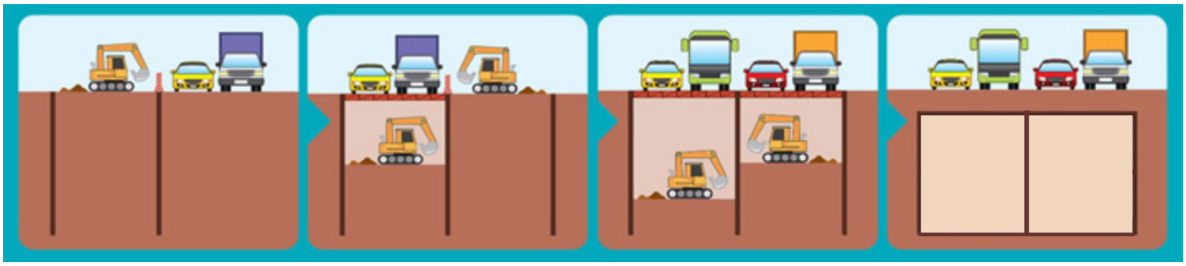

Figure 2. Top – Down Construction Phases

CALIFORNIA HIGH SPEED TRAIN PROJECT

CONSTRUCTABILITY ANALYSIS

APPENDIX E. GRADE CROSSING ANALYSIS

December 2018

prointec

APPENDIX E. GRADE CROSSING ANALYSIS

Index

1. INTRODUCTION 1
2. DESCRIPTION OF EXISTING GRADE CROSSING 1
3. ACTIONS DURING THE WORKS 3
4. DESCRIPTION OF FINISHED GRADE CROSSING 4

1. INTRODUCTION

The existing rail corridor between the stations of San Jose and Gilroy has a semi-urban configuration that causes interference with the regulation of automobile traffic. Therefore, several structures are located that allow the passage to different levels, as well as grade crossings.

These grade crossing resolve intersections at the same level of the roads, both with minor roads, and streets with several lanes in each direction. Many of these grade crossing will remain in the final designed solution.

In this document, the execution methods are analyzed in such a way that the remodeling works of the grade crossing, the works of the railroad and the traffic through the grade crossing are compatible.

2. DESCRIPTION OF EXISTING GRADE CROSSING

The existing grade crossings are characterized by having the necessary elements that allow the circulation of railroads, vehicles and people, with adequate safety conditions.

Figure 1. General configuration of grade crossing

To allow the passage of vehicles on the road, a series of prefabricated concrete or metal plates are placed on the sleepers and level with the upper rail. Continuity is given to the resulting platform with concrete or asphalt, forming a continuous surface and adapting the access wedges.

Figure 2. Platform for vehicular passage on the tracks.

To condition the access to the grade crossing, they are equipped with the necessary safety systems, which vary according to the characteristics of the railway corridor and the roads.

In the case of major roads, there are automatic barriers, light and acoustic beacons, horizontal and vertical signage, as well as previous warnings to reduce the speed of vehicles.

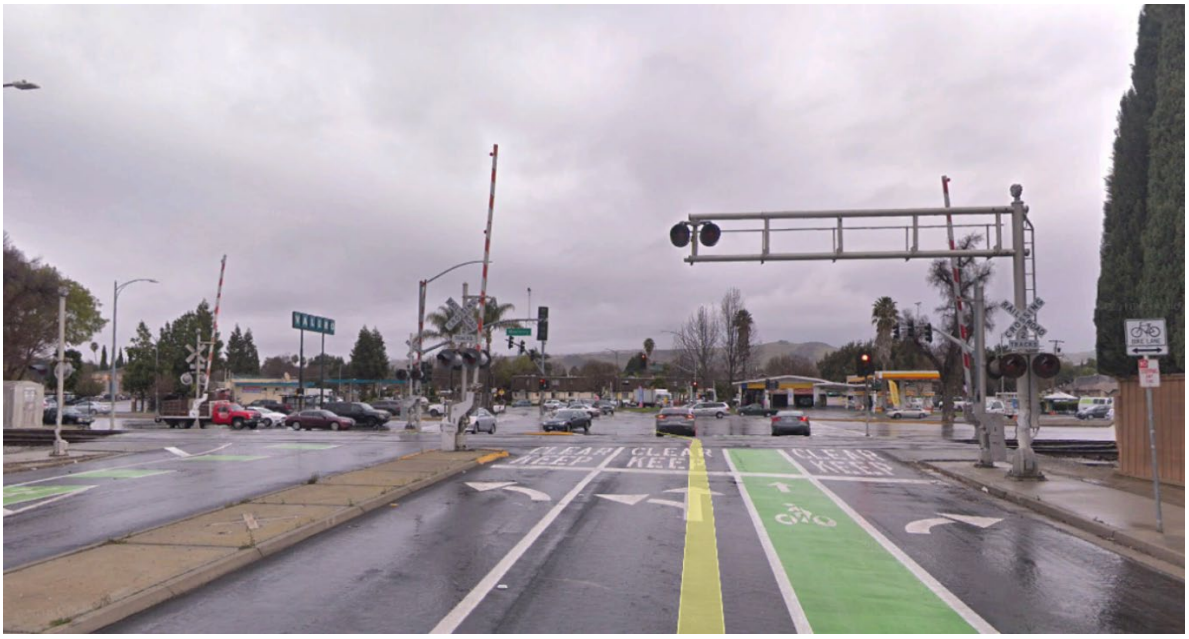

Figure 3. Access to grade crossing from urban road.

Figure 4. Access to grade crossing from non-urban road.

For pathways and roads of inferior characteristics, vertical signaling of warning and detention is placed.

3. ACTIONS DURING THE WORKS

The design of the new railway corridor contemplates the affection of the different grade crossing it intercepts. Various solutions are proposed, ranging from the remodeling of the existing crossing to the suppression of some of them.

The premise is to reduce to the minimum possible the interruption of the railway service as well as of vehicles and pedestrians, undertaking and coordinating the work as described below:

- Railway: In the case of track cuts, night work is planned during the week days, extending the period on weekends from Friday afternoon to Sunday night. In these periods of stoppage, as appropriate, proceed to:
    - Horizontal and vertical displacement of existing tracks.
    - Construction of new tracks.
    - Electrification conditioning.
    - Placement of plates to form the passage platform.
- Vehicles: The main traffic directions will be maintained, undertaking the necessary detours.
    - Signposting of the different detours according to the construction phases.

- Conditioning of the road platform in accordance with the new railway layout.

- Pedestrians: Special attention will be given to pedestrian traffic, not only by the traffic of trains and vehicles, also by the construction machinery.

4. DESCRIPTION OF FINISHED GRADE CROSSING

Both the level crossing and the accesses must remain fully operational once the works are completed, in such a way that the necessary movements of railway, vehicular and pedestrian traffic are allowed, always preserving their safety.

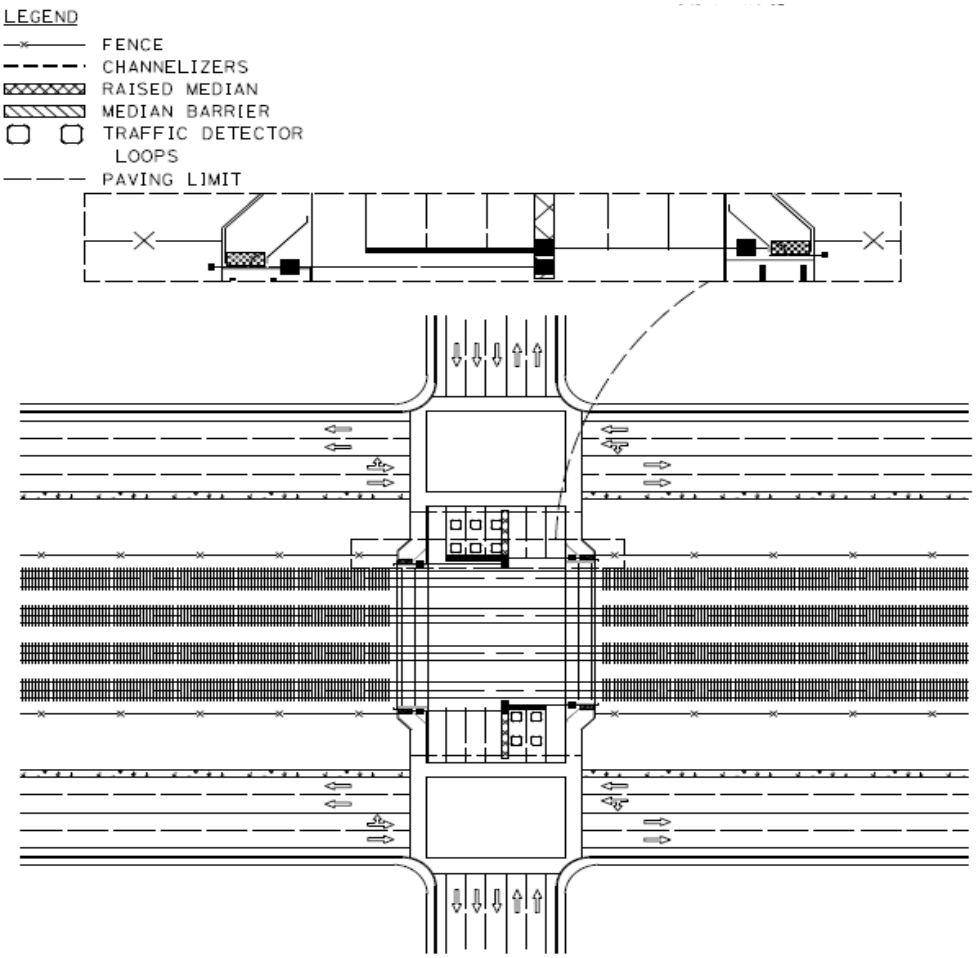

Figure 5. Scheme of grade crossing finished.

To this end, the whole of the intersection will be equipped, as the case may be, with:

- Railway corridor enclosure fence.
- Automatic barriers for the regulation of vehicle traffic.
- Loops under the pavement for the detection of vehicles in the accesses.

- Horizontal, vertical, luminous and acoustic signaling.
- Steel gates for pedestrians.

In those cases in which the existing grade crossing is suppressed, the necessary physical systems that impede the access of vehicles to the tracks will be available.

1. INTRODUCTION

The Alternative 4 is a layout proposal between Scott Boulevard and Gilroy that is characterized by building on the existing UPRR Corridor to establish a new layout where two high speed and one UPRR tracks will go through.

The area in which this corridor is located presents a high urban density. The new railway layout will share the UPRR ROW. Generally the ROW is 60 ft. wide, space where the three tracks shall be accommodated. Due to the ROW limitation, and to avoid exceeding the current limits, the section adopted is usually located between walls.

The section type proposed has a width of 60 ft. This width will accommodate two tracks intended for high speed service (MT-2 and MT-3) and a third track aimed at maintaining the UPRR service (MT-1). Only the HSR tracks will be electrified.

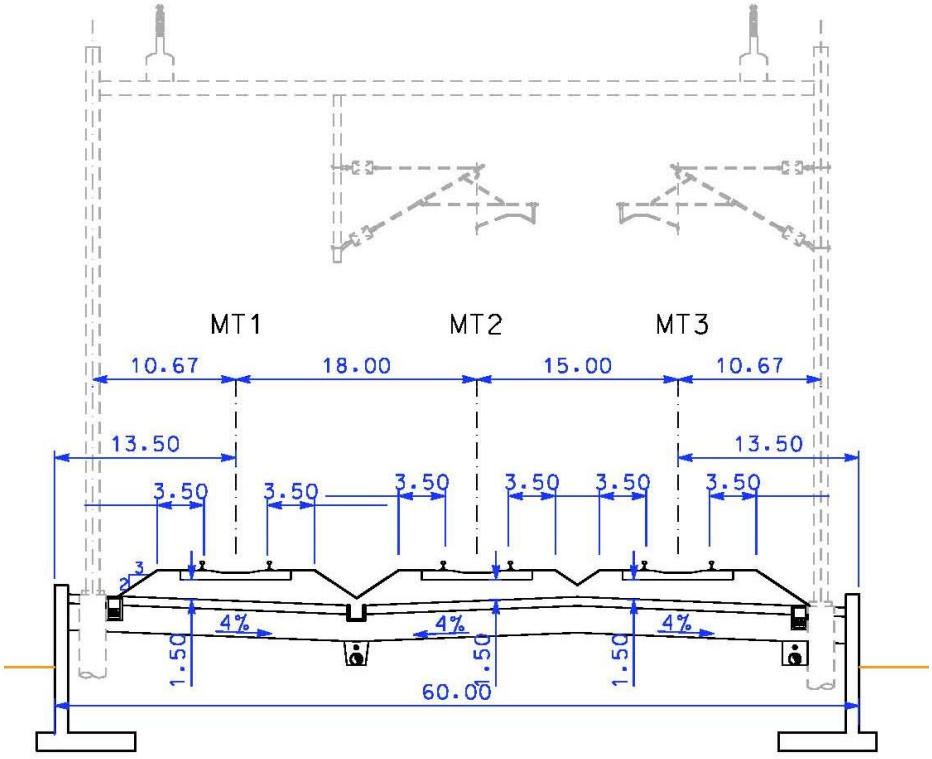

Figure 1. Typical section 60 ft.

2. BASELINE

Files used as baseline are listed below:

- Existing layout:
  - X-FJ-TT-ALGN-EXST-Caltrain-2016.dgn

    Information from this file is limited, it establishes the entire layout in the ground plan, but the profile is only available between Scott Boulevard and Tamien Station.
- Future layouts:
  - X-JM-TT-ALGN-PROP-ALT4-CPCST-CPLK.dgn
  - X-JM-TT-ALGN-PROP-ALT4-CPLK.dgn

    These files set axes MT-1, MT-2 and MT-3 in the ground plan. The profile of axis MT-3 is the only one established.

3. INITIAL HYPOTHESIS

Currently, the railway layout is not electrified, though the electrification of one of the tracks to CP Michael is foreseen in the near future. As baseline for the design solution, the section between Scott Boulevard and CP Michael will be assumed as electrified, all Caltrain tracks between and Scott and San Jose Station and only one track (right) between San Jose and CP Michael.

During works execution, at least one track will remain operational for passengers and freight.

Outage periods concerning track works will be determined following the same criteria as in San Francisco-San Jose corridor (PCEP, Caltrain).

The section between Scott and CP Lick will remain operational as long as possible, so the possibility of shifting the track will be studied. Concerning the section from CP Lick up to the end, the working hypothesis is to dismantle the existing tracks and place new ones.

4. LAYOUT GENERAL DESCRIPTION

As mentioned above, the new layout runs parallel to the UPRR line, sharing both the same corridor. The study begins on Scott Boulevard, near Santa Clara Station. Building on the existing tracks, it goes on to San Jose Station, where it adapts to high speed circulation conditions. Having passed San Jose, the layout is parallel to the UPRR double track to Tamien Station. An additional axis is designed for this area, located west (MT-3) to the

existing ones. Leaving Tamien Station, an area is included to ease parking and trains turnaround headed to San Jose.

The layout is parallel to Monterrey Rd from the Capitol Station to Morgan Hill. After passing Morgan Hill, the corridor is placed next to the road through Railroad Ave until it crosses Llagas Creek, where it becomes parallel again to Monterrey Rd to Gilroy. In Gilroy, the layout moves away from Monterrey Rd to the Station, which is adapted to high speed services through the placement of two 800 ft. platforms intended for high speed traffic and another two of 600 ft. for Caltrain.

From Gilroy Station, two UPRR axes are set, besides another two of high speed. These axes go in parallel building on the existing layout until the I-101 crossing. From the I-101 crossing, the high speed alignment is designed alone, through agricultural lands until it meets the line defined in Segment 9.

5. CONSTRUCTABILITY

For purposes of analyzing Alternative 4 Constructability, eight sections are distinguished:

WS 1. Section from Scott Boulevard to San Jose Station.
WS 2. Section San Jose Station.
WS 3. Section from San Jose Station to CP Lick.
WS 4. Section from CP Lick to 725+00.
WS 5. Section from 725+00 to 1265+00.
WS 6. Section from 1265+00 to Gilroy Station.
WS 7. Section Gilroy Station. 2027 Configuration
WS 8. Section 1700+00 to 1922+90. 2027 Configuration

The last two sections have been considered for 2027 configuration. In 2027, the HSR will be operational from San Jose to Gilroy. In this year the Gilroy MOWF will be connected to existing UPRR. The connection of Gilroy MOWF to HSR tracks will be executed in 2031.

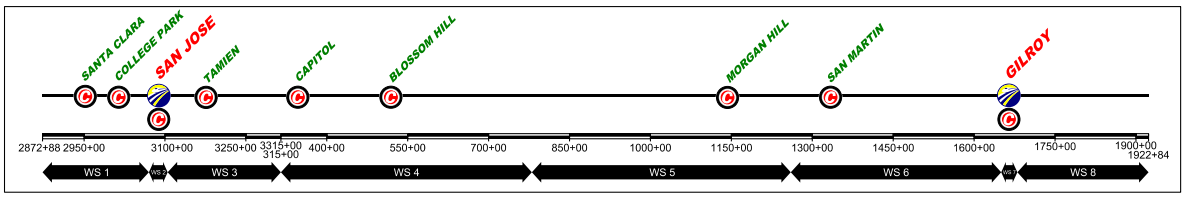

Figure 2. Works Sections scheme.

In parallel, a study of track shift works is being developed between Scott and CP Lick. The object of this analysis is to define susceptible areas of use without big adaptation works. This study analyzes lateral and vertical displacement between existing and future axis, areas of adaptation of existing OCS and actions on grade crossing and turnouts.

This section is marked by the presence of a series of wildlife transversal passages. The description of construction methods to be executed is presented in Appendices B, C and D.

It also stands out due to the maintenance of a large number of level crossings. These level crossings will be adjusted to the new tracks geometry. The description of construction methods to be executed is presented in Appendix E.

The appendix I show graphic information about construction phases for built the alternative 4. This appendix is divided in the segments indicated in this point. For each segment the appendix display plans, schemes, profile and sections organized by phases.

5.1 Section Scott Boulevard - San Jose

This section uses practically every existing track. Only a new UPRR track will be placed from the Caltrain workshops area to San Jose Station. The execution of a new track outside the existing ones requires a reconfiguration of the UPRR connection to tracks bound to Fremont.

In order to adapt the connectivity between the diverse existing tracks, the number of existing switch gears will increase.

This area currently has two Caltrain stations, Santa Clara and Collage Park. The first one remains unchanged, whereas, in the second one, the removal of existing platforms is foreseen as well as executing a single platform servicing track MT-3.

Initial assumptions in this area are that Caltrain tracks are electrified, whilst the rest aren't. Due to the high number of current tracks, electrification is supposed to be executed by using gantries.

Execution works consist in adapt the existing electrification systems in the first place, for the line to remain electrified during works and so it can be used later, in the future situation. These works will essentially consist in increasing the size of the current gantries so another axis can be added. Information on these works execution is described in Appendix A Electrification.

Once the electrification adaptation works are executed, a new UPRR axis will be placed in parallel to the existing ones.

New shifting gears will be installed in this area, and some of the current ones will be replaced by new gears. In order to install the new gears, and considering that tracks are in use, assembly systems proposed will allow to carry out a preassembly of the shifting gear in an assembling facility at an early stage to subsequently move it to its definitive location through special railway machinery. Once the gear is installed in its definitive position, the electrification system will need to be adapted. These works are generally executed in extraordinary outage periods, at night or on a weekend.

5.2 San Jose Station

Changes on San Jose Station aim at extending the available length of the platform. For this reason, east and west station heads will be modified. Works have been foreseen in such a way as that at least one platform remains in use.

East station head presents grater changes that the west one, since besides the head modification, including a double crossover is also foreseen. This double crossover must be executed on a weekend, during which the connection to Campbell will be closed to the traffic.

5.3 Section San Jose-CP Lick.

This section is characterized by its complexity. Having passed San Jose Station and up to Tamien Station, a new axis will be placed west of the existing ones. The execution of this new axis requires building a series of parallel structures to the current ones.

Currently, CP Lick layout has two tracks. As initial assumption it's been established that the right track until CP Michael is electrified.

This section shows an Station in Tamien that also has a series of siding tracks to facilitate rebound to San-Jose.

The introduction of a new axis is foreseen in the future to provide the layout with a (left) axis for UPRR only, and two axis (central and right) for the high-speed and Caltrain lines.

A significant part of the layout is based on the existing horizontal alignment, so it is partially usable. The degree of utilization is analyzed in parallel with Appendix G Track Shift Works Scott to CP Lick.

The studied section is divided in three distinct areas. A first area to the Tamien Station, the second one from Tamien Station to crossing with HWY-87 and a last area from HWY-87 to CP-Lick.

The first area builds partially on the current layout, and a parallel track will be executed on the right side of the existing tracks. The execution of this parallel track requires developing a series of structures parallel to the current track, except for those structures crossing over Bird Ave and Delmas Ave which will be demolished in order to build the definite ones. The execution of these structures will be phased to avoid closing the line.

The section between Tamien Station and the HWY-87 undercrossing currently has several siding tracks of both UPRR and Caltrain types. These tracks will be rearranged in the future creating a UPRR set of tracks around track MT-1. Between tracks MT-2 and MT-3 two siding tracks will be installed aiming at facilitating trains rebound to San Jose. **The constructability analysis has kept at least four rebound tracks in all intermediate stages.**

The final part of the section is marked by the tracks increase from two to three. The left track will be used for the execution. A new track is built on the right and the central one is carried out building on the displacement of the existing right track. Tamien Station platforms will not be affected.

As pointed earlier, the track side is electrified until CP Michael. According to work stages required to execute the tracks assembly in their definitive position, it will be necessary to execute a provisional assembly of an electrification system of the existing left track. Poles position must be compatible with the definitive position of track MT-1. Provisional electrification will be dismantled in the set of tracks location area around MT-1.

5.4 Section 315+00-785+00

This section runs from CP Lick to crossing with Bayley Rd. Almost the whole section runs in a double track. It contains the Capitol and Blossom Hill Stations, both with platforms currently on the left track. This section runs in parallel to Monterey Rd.

For the execution it is assumed that at least one track must remain operational. That's why, construction phases are based on the idea of constructing all possible track sections located on the left side of the current compatible tracks.

Once tracks on the left are executed, service will only be restored through the current left track, which allows to dismantle the right side and start the execution works of the future right track. During this phase, the definitive platforms right half on Capitol and Blossom Hill Stations will be executed.

Once the right track is installed, traffic can be restored. Thus, the left track can be dismantled and executing the rest of MT-1 and MT-2 track sections. Platforms will be finished at this stage.

The singularity of this section is its three wildlife passages. These passages are marked by being transversal works to the alignment, crossing the existing track and Monterey Rd.

From the point of view of railway traffic alterations it is planned to divide works execution in two phases, ensuring railway traffic. Planned methods for works execution are shown in Appendixes B and C.

Monterey Rd. underpass presents a greater complexity. Monterey Rd. is a two-lane road in each direction so, to secure traffic, a part of the road must be closed reducing traffic to a single lane or a temporary detour must be built in order to maintain the road capacity. Choosing one or another system will be established by the road traffic intensity and the wildlife underpass characteristics (dimensions, prefabricated or executed on site). Proposed construction procedures are included in Appendix D.

In case of track transversal crossings, Appendix D describes different execution methods of transversal crossings under circulation roads. In our case, the best method is to divide execution in several parts, since planned construction phases considered keeping one line in use.

5.5 Section 785+00-1265+00

This section is characterized by running in an almost completely single road, only one track section at the end is double, from San Pedro Ave. crossing. In this section covers Morgan Hill Station.

It can be transversely crossed through eight level passages and it overpasses Monterey Rd, as well as Fisher Creek and Little Llagas Creek courses.

Track runs on the right of Monterey Rd until their cross with San Pedro Ave, the railway layout runs on the right side of Railroad Ave.

Over time, the section will have three tracks in its entire length and will be crossed by 5 wildlife passages.

Construction phases are based on installing the left track in the area occupied by the single track. The extension of Morgan Hill Station platforms will be carried out in this phase, as well as works of those wildlife passages that do not affect the operational track.

The structure over Monterey Rd will also be executed which will accommodate track MT-1.

Next phase establishes a provisional connection, after leaving behind Morgan Hill Station between the new track MT-1, executed during the previous phase, and the right track of the existing double track section. After entry into service these tracks, the dismantling of the non-operational track follows, particularly the structure over Monterey Rd.

During phase three, tracks MT-2 and MT-3 are executed to San Pedro Ave, and track MT-3 from San Pedro Ave right up to the end. Morgan Hill right platform will also be executed in this phase.

Provisional connection of track MT-1 with track MT-3 is performed in phase four in San Pedro Ave surroundings. Once done, traffic will be restored on this continuous axis. When the line is in operation, the existing left track is dismantled from San Pedro Ave up to the end, and tracks MT-1 and MT-2 to San Pedro Ave. The structure of tracks MT-2 and MT-3 over Monterey Rd. will also be executed in this phase.

Phase five provides continuity to track MT-3 by restoring this track traffic, and also proceeds to execute tracks MT-1 and MT-2 in their final section, from San Pedro Ave.

All information regarding wildlife passages explained in the previous section is applicable to this one.

5.6 Section 1265+00 to Gilroy Station

This section runs entirely in a single track, except for a little part at the beginning. It has one station (San Martin Station), and the most singular point is the passage over Llagas Creek. It is marked by the elevated number of grade crossings.

Construction phases are conditioned by the Llagas Creek overpassage. Currently, crossing is carried out through a single track bridge. The future layout improves its existing geometry and rises the future grade elevation in the crossing point on Llagas Creek, so the existing structures must be demolished.

The first phase of the construction process raises the left track of the section and carries out the first stage of the structure over Llagas Creek as well as the embankment–structure transitions. In this area temporary earth support systems will be used to prevent the operational track to be filled by earth moving slides of the new track MT-3.

The second phase firstly executes provisional connections of the installed track MT-3 with the current track in the Llagas Creek surroundings, which is put in service. Subsequently, the previously operational track is removed and the existing structure over Llagas Creek is demolished. This phase is completed by the execution of the entire MT-1 axis that involves developing another part of the structure over Llagas Creek.

In phase three the rail traffic is moved to the MT-1 axis. Having a provisional platform available is required to maintain in service San Martin Station. This phase ends by removing the entire existing track that is no longer operational.

The fourth phase maintains the traffic in track MT-1. Tracks MT-2 and MT-3 are executed in this phase together with the San Martin Station platform between tracks MT-2 and MT-3. The structure over Llagas Creek is completed in this phase.

Phase five puts all tracks into service. Works to be executed are the dismantling of the provisional platform and the execution of a footbridge giving access to platforms, since it is placed in an area occupied by the provisional platform.

5.7 Section Gilroy Station

Gilroy Station section covers the area affected by the execution of the Gilroy Station. The analysis is conducted for the 2027 configuration. This configuration is the same as the definitive configuration except for the high-speed connection to Merced.

At present, Gilroy Station has only one passengers platform. Next to the platform there is a series of tracks to rebound to San Jose. The UPRR track arrives from Watsonville at the Gilroy Station in a single track where there is a siding track.

In the definitive situation, Gilroy Station has two high-speed platforms located outside tracks MT-2 and MT-3, and another two platforms for Caltrain circulations in two MT-2 and MT-3 siding tracks. Track MT-1, used by UPRR is doubled from the Gilroy Station. Additionally, there is a set of three tracks intended for Caltrain trains stabling.

In the definitive configuration, the UPRR track duplication and the high-speed connection to Merced are both finished.

Phasing execution in this section enables to maintain the connection service with San Jose and with the UPRR track to Watsonville throughout all phases stages.

In phase 1 all tracks not affecting the existing tracks are executed. Tracks MT-1 and MT-2 to Gilroy, UPRR tracks from Gilroy and siding tracks on the right side of track MT-3.

In phase 2, one of the UPRR tracks and two of the Gilroy rebound tracks are dismantled.

In phase 3, Caltrain and high-speed left platforms are executed as well as their corresponding tracks.

In phase 4, track MT-1 is continued by shifting the existing track. This phase will be carried out during an extraordinary outage period of the UPRR track.

In phase 5, tracks MT-1 and MT-2 are put into service. All existing tracks are dismantled except for an initial section where connection with track MT-2 is located.

In phase 6, the entirety of tracks is finished with the exception of the coincident section with the initial section of the existing track. A temporary connection of new and existing UPRR tracks is put in place.

In phase 7, traffic circulation runs on tracks MT-1 and MT-3. The initial section that hadn't been dismantled will in this phase be removed.

Phase 8 finishes track MT-2.

In the future, the connection with Merced will be performed by prolonging axis MT-2 and MT-3.

5.8 Section 1700+1922+00

It corresponds to the execution of a regular track section on embankment, highlighting the presence of the Gilroy maintenance facility. This facility will enter into service before the segment from Gilroy to Merced. During this time period, access to the facility will only be possible from the UPRR line bound for Gilroy, so it will be necessary to define two constructive solutions to allow access to the maintenance facility in the two temporary scenarios.

2027 configuration: Connection of the existing UPRR track with the MOWF. In this case, works consist in connecting the current UPRR to Hollister together with the maintenance facility:

- It is adapted to the grade alignment of the current UPRR track, so to install a switch gear to gain the facility, in the road environment of Bloomfield Rd. Planet's configuration remains. This phase must be performed during a special outage period since the only existing track could be affected.
- Construction of tracks and MOWF.

2031 configuration: Connection of the new high speed infrastructure with the existing MOWF. This scenario requires the execution of a track detour to Hollister, as existing high speed design may be affected:

- Restoration of the UPRR track to Hollister in the area of the junction and the high speed tracks by means of a newly designed branch.
- Connection of new branch with the UPRR track in both ends, during a single extraordinary outage period.

- This detour allows building without interference the high speed corridor and the access branch to MOWF. Two metallic structures prevent the disruption between the high speed tracks and the access branch, with UPRR to Watsonville and the new layout to Hollister.

CONSTRUCTABILITY ANALYSIS

APPENDIX G. TRACK SHIFT WORKS SCOTT BOULEVARD TO CP LICK.

December 2018

prointec

APPENDIX G. TRACK SHIFT WORKS SCOTT BOULEVARD TO CP LICK

Index

1. ACTIONS ON THE SCOTT BOULEVARD TO CP LICK SECTION. 1

1. ACTIONS ON THE SCOTT BOULEVARD TO CP LICK SECTION.

The section studied, between Scott Boulevard to CP Lick, presents two zones clearly differentiated by their current and future features.

The first of them covers from Scott Boulevard to San Jose station, which takes advantage of the current configuration of tracks in this area, where the station of Santa Clara, College Park and the Caltrain workshops are located. The works planned for the adaptation of the corridor to the high speed consist mainly in horizontal and vertical adjustments of the existing infrastructure.
